For a moment the elder still lacked the feeling of recognition, but after he accepted the name he was able to state why it had escaped him. He thought: "Obviously because the second half, *vetrano,* suggests *veteran.* I am aware that I am not quite anxious to think of ageing, and react peculiarly when I am reminded of it. Thus, *e.g.,* I had recently reminded a very esteemed friend in most unmistakable terms that he had 'long ago passed the years of youth,' because before this he once remarked in the most flattering manner, 'I am no longer a young man.' That my resistance was directed against the second half of the name *Castelvetrano* is shown by the fact that the initial sound of the same returned in the substitutive name Caltanisetta."

"What about the name Caltanisetta itself?" asked the younger.

"That always seemed to me like a pet name of a young woman," admitted the elder.

Somewhat later he added: “The name for *Enna* was also only a substitutive name. And now it occurs to me that the name *Castrogiovanni*, which obtruded itself with the aid of a rationalization, alludes as expressly to *giovane*, young, as the last name, *Castelvetrano*, to *veteran.*”

The older man believed that he had thus accounted for his forgetting the name. What the motive was that led the young man to this memory failure was not investigated.

In some cases one must have recourse to all the fineness of psychoanalytic technique in order to explain the forgetting of a name. Those who wish to read an example of such work I refer to a communication by Professor E. Jones. [4]

I could multiply the examples of name-forgetting and prolong the discussion very much further if I did not wish to avoid elucidating here almost all the view-points which will be considered in later themes. I shall, however, take the liberty of comprehending in a few sentences the results of the analyses reported here.

The mechanism of forgetting, or rather of losing or temporary forgetting of a name, consists in the disturbance of the intended reproduction of the name through a strange stream of thought unconscious at the time. Between the disturbed name and the disturbing complex there exists a connection either from the beginning or such a connection has been formed — perhaps by artificial means — through superficial (outer) associations.

The self-reference complex (personal, family or professional) proves to be the most effective of the disturbing complexes.

A name which by virtue of its many meanings belongs to a number of thought associations (complexes) is frequently disturbed in its connection to one series of thoughts through a stronger complex belonging to the other associations.

To avoid the awakening of pain through memory is one of the objects among the motives of these disturbances.

In general one may distinguish two principal cases of name-forgetting; when the name itself touches something unpleasant, or when it is brought into connection with other associations which are influenced by such effects. So that names can be disturbed on their own account or on account of their nearer or more remote associative relations in the reproduction.

A review of these general principles readily convinces us that the temporary forgetting of a name is observed as the most frequent faulty action of our mental functions.

However, we are far from having described all the peculiarities of this phenomenon. I also wish to call attention to the fact that name-forgetting is extremely contagious. In a conversation between two persons the mere mention of having forgotten this or that name by one often suffices to induce the same memory slip in the other. But whenever the forgetting is induced, the sought-for name easily comes to the surface.

There is also a continuous forgetting of names in which whole chains of names are withdrawn from memory. If in the course of endeavouring to discover an escaped name one finds others with which the latter is intimately connected, it often happens that these new names also escape. The forgetting thus jumps from one name to another, as if to demonstrate the existence of a hindrance not to be easily removed.

IV. Childhood and Concealing Memories

IN a second essay, [1] I was able to demonstrate the purposive nature of our memories in an unexpected field. I started with the remarkable fact that the earliest recollections of a person often seemed to preserve the unimportant and accidental, whereas (frequently though not universally!) not a trace is found in the adult memory of the weighty and affective impressions of this period. As it is known that the memory exercises a certain selection among the impressions at its disposal, it would seem logical to suppose that this selection follows entirely different principles in childhood than at the time of intellectual maturity. However, close investigation points to the fact that such an assumption is superfluous. The indifferent childhood memories owe their existence to a process of displacement. It may be shown by psychoanalysis that in the reproduction they represent the substitute for other really significant impressions, whose direct reproduction is hindered by some resistance. As they do not owe their existence to their own contents, but to an associative relation of their contents to another repressed thought, they deserve the title of "concealing memories," by which I have designated them.

In the aforementioned essay I only touched upon, but in no way exhausted, the varieties in the relations and meanings of concealed memories. In the given example fully analysed I particularly emphasized a peculiarity in the temporal relation between the concealing memory and the contents of the memory concealed by it. The content of the concealing memory in that example belonged to one of the first years of childhood, while the thoughts represented by it, which remained practically unconscious, belonged to a later period of the individual in question. I called this form of displacement a retro-active or *regressive* one. Perhaps more often one finds the reversed relation — that is, an indifferent impression of the most remote period becomes a concealing memory in consciousness, which simply owes its existence to an association with an earlier experience, against whose direct reproduction there are resistances. We would call these *encroaching* or *interposing* concealing memories. What most concerns the memory lies here chronologically beyond the concealing memory. Finally, there may be a third possible case, namely, the concealing memory may be connected with the impression it conceals,

not only through its contents, but also through contiguity of time; this is the *contemporaneous* or *contiguous* concealing memory.

How large a portion of the sum total of our memory belongs to the category of concealing memories, and what part it plays in various neurotic hidden processes, these are problems into the value of which I have neither inquired nor shall I enter here. I am concerned only with emphasizing the sameness between the forgetting of proper names with faulty recollection and the formation of concealing memories.

At first sight it would seem that the diversities of both phenomena are far more striking than their exact analogies. There we deal with proper names, here with complete impressions experienced either in reality or in thought; there we deal with a manifest failure of the memory function, here with a memory act which appears strange to us. Again, there we are concerned with a momentary disturbance — for the name just forgotten could have been reproduced correctly a hundred times before, and will be so again from to-morrow on; here we deal with lasting possession without a failure, for the indifferent childhood memories seem to be able to accompany us through a great part of life. In both these cases the riddle seems to be solved in an entirely different way. There it is the forgetting, while here it is the remembering which excites our scientific curiosity.

After deeper reflection one realizes that, although there is a diversity in the psychic material and in the duration of time of the two phenomena, yet these are by far outweighed by the conformities between the two. In both cases we deal with the failure of remembering: what should be correctly reproduced by the memory fails to appear, and instead something else comes as a substitute. In the case of forgetting a name there is no lack of memory function in the form of name substitution. The formation of a concealing memory depends on the forgetting of other important impressions. In both cases we are reminded by an intellectual feeling of the intervention of a disturbance, which in each case takes a different form. In the case of forgetting of names we are aware that the substitutive names are incorrect, while in concealing memories we are surprised that we have them at all. Hence, if psychologic analysis demonstrates that the substitutive formation in each case is brought about in the same manner — that is, through displacement along a superficial association — we are justified in saying that the diversities in material, in duration of time, and in the centring of both phenomena serve to enhance our expectation, that

we have discovered something that is important and of general value. This generality purports that the stopping and straying of the reproducing function indicates more often than we suppose that there is an intervention of a prejudicial factor, a tendency which favours one memory and at the same time works against another.

The subject of childhood memories appears to me so important and interesting that I would like to devote to it a few additional remarks which go beyond the views expressed so far.

How far back into childhood do our memories reach? I am familiar with some investigations on this question by V. and C. Henri [2] and Potwin. [3] They assert that such examinations show wide individual variations, inasmuch as some trace their first reminiscences to the sixth month of life, while others can recall nothing of their lives before the end of the sixth or even the eighth year. But what connection is there between these variations in the behaviour of childhood reminiscences, and what signification may be ascribed to them? It seems that it is not enough to procure the material for this question by simple inquiry, but it must later be subjected to a study in which the person furnishing the information must participate.

I believe we accept too indifferently the fact of infantile amnesia — that is, the failure of memory for the first years of our lives — and fail to find in it a strange riddle. We forget of what great intellectual accomplishments and of what complicated emotions a child of four years is capable. We really ought to wonder why the memory of later years has, as a rule, retained so little of these psychic processes, especially as we have every reason for assuming that these same forgotten childhood activities have not glided off without leaving a trace in the development of the person, but that they have left a definite influence for all future time. Yet in spite of this unparalleled effectiveness they were forgotten! This would suggest that there are particularly formed conditions of memory (in the sense of conscious reproduction) which have thus far eluded our knowledge. It is quite possible that the forgetting of childhood may give us the key to the understanding of those amnesias which, according to our newer studies lie at the basis of the formation of all neurotic symptoms.

Of these retained childhood reminiscences, some appear to us readily comprehensible, while others seem strange or unintelligible. It is not difficult to correct certain errors in regard to both kinds. If the retained reminiscences of a person are subjected to an analytic test, it can be

readily ascertained that a guarantee for their correctness does not exist. Some of the memory pictures are surely falsified and incomplete, or displaced in point of time and place. The assertions of persons examined that their first memories reach back perhaps to their second year are evidently unreliable. Motives can soon be discovered which explain the disfigurement and the displacement of these experiences, but they also demonstrate that these memory lapses are not the result of a mere unreliable memory. Powerful forces from a later period have moulded the memory capacity of our infantile experiences, and it is probably due to these same forces that the understanding of our childhood is generally so very strange to us.

The recollection of adults, as is known, proceeds through different psychic material. Some recall by means of visual pictures — their memories are of a visual character; other individuals can scarcely reproduce in memory the most paltry sketch of an experience; we call such persons *"auditifs"* and *"moteurs"* in contrast to the *"visuels,"* terms proposed by Charcot. These differences vanish in dreams; all our dreams are preponderatingly visual. But this development is also found in the childhood memories; the latter are plastic and visual, even in those people whose later memory lacks the visual element. The visual memory, therefore, preserves the type of the infantile recollections. Only my earliest childhood memories are of a visual character; they represent plastically depicted scenes, comparable only to stage settings.

In these scenes of childhood, whether they prove true or false, one usually sees his own childish person both in contour and dress. This circumstance must excite our wonder, for adults do not see their own persons in their recollections of later experiences. [4] It is, moreover, against our experiences to assume that the child's attention during his experiences is centred on himself rather than exclusively on outside impressions. Various sources force us to assume that the so-called earliest childhood recollections are not true memory traces but later elaborations of the same, elaborations which might have been subjected to the influences of many later psychic forces. Thus the, "childhood reminiscences" of individuals altogether advance to the signification of "concealing memories," and thereby form a noteworthy analogy to the childhood reminiscences as laid down in the legends and myths of nations.

Whoever has examined mentally a number of persons by the method of psychoanalysis must have gathered in this work numerous examples of concealing memories of every description. However, owing to the previously discussed nature of the relations of the childhood reminiscences to later life, it becomes extraordinarily difficult to report such examples. For, in order to attach the value of the concealing memory to an infantile reminiscence, it would be often necessary to present the entire life-history of the person concerned. Only seldom is it possible, as in the following good example, to take out from its context and report a single childhood memory.

A twenty-four-year-old man preserved the following picture from the fifth year of his life: In the garden of a summer-house he sat on a stool next to his aunt, who was engaged in teaching him the alphabet. He found difficulty in distinguishing the letter *m* from *n*, and he begged his aunt to tell him how to tell one from the other. His aunt called his attention to the fact that the letter *m* had one whole portion (a stroke) more than the letter *n*. There was no reason to dispute the reliability of this childhood recollection; its meaning, however, was discovered only later, when it showed itself to be the symbolic representation of another boyish inquisitiveness. For just as he wanted to know the difference between *m* and *n* at that time, so he concerned himself later about the difference between boy and girl, and he would have been willing that just this aunt should be his teacher. He also discovered that the difference was a similar one; that the boy again had one whole portion more than the girl, and at the time of this recognition his memory awoke to the corresponding childish inquisitiveness.

I would like to show by one more example the sense that may be gained by a childhood reminiscence through analytic work, although it may seem to contain no sense before. In my forty-third year, when I began to interest myself in what remained in my memory of my own childhood, a scene struck me which for a long time, as I afterwards believed, had repeatedly come to consciousness, and which through reliable identification could be traced to a period before the completion of my third year. I saw myself in front of a chest, the door of which was held open by my half-brother, twenty years my senior. I stood there demanding something and screaming; my mother, pretty and slender, then suddenly entered the room, as if returning from the street.

In these words I formulated this scene so vividly seen, which, however, furnished no other clue. Whether my brother wished to open or lock the chest (in the first explanation it was a “cupboard”), why I cried, and what bearing the arrival of my mother had, all these questions were dim to me; I was tempted to explain to myself that it dealt with the memory of a hoax by my older brother, which was interrupted by my mother. Such misunderstandings of childhood scenes retained in memory are not uncommon; we recall a situation, but it is not centralized; we do not know on which of the elements to place the psychic accent. Analytic effort led me to an entirely unexpected solution of the picture. I missed my mother and began to suspect that she was locked in this cupboard or chest, and therefore demanded that my brother should unlock it. As he obliged me, and I became convinced that she was not in the chest, I began to cry; this is the moment firmly retained in the memory, which was directly followed by the appearance of my mother, who appeased my worry and anxiety.

But how did the child get the idea of looking for the absent mother in the chest? Dreams which occurred at the same time pointed dimly to a nurse, concerning whom other reminiscences were retained; as, for example, that she conscientiously urged me to deliver to her the small coins which I received as gifts, a detail which in itself may lay claim to the value of a concealing memory for later things. I then concluded to facilitate for myself this time the task of interpretation, and asked my now aged mother about that nurse. I found out all sorts of things, among others the fact that this shrewd but dishonest person had committed extensive robberies during the confinement of my mother, and that my half-brother was instrumental in bringing her to justice.

This information gave me the key to the scene from childhood, as through a sort of inspiration. The sudden disappearance of the nurse was not a matter of indifference to me; I had just asked this brother where she was, probably because I had noticed that he had played a part in her disappearance, and he, evasive and witty as he is to this day, answered that she was “boxed in.” I understood this answer in the childish way, but asked no more, as there was nothing else to be discovered. When my mother left me shortly thereafter I suspected that the naughty brother had treated her in the same way as he did the nurse, and therefore pressed him to open the chest.

I also understand now why in the translation of the visual childhood scene my mother's slenderness was accentuated; she must have struck me as being newly restored. I am two and a half years older than the sister born at that time, and when I was three years of age I was separated from my half-brother.

V. Mistakes in Speech

ALTHOUGH the ordinary material of speech of our mother-tongue seems to be guarded against forgetting, its application, however, more often succumbs to another disturbance which is familiar to us as “slips of the tongue.” What we observe in normal persons as slips of the tongue gives the same impression as the first step of the so-called “paraphasias” which manifest themselves under pathologic conditions.

I am in the exceptional position of being about to refer to a previous work on the subject. In the year 1895 Meringer and C. Mayer published a study on *Mistakes in Speech and Reading,* with whose view-points I do not agree. One of the authors, who is the spokesman in the text, is a philologist actuated by a linguistic interest to examine the rules governing those slips. He hoped to deduce from these rules the existence “of a definite psychic mechanism,” “whereby the sounds of a word, of a sentence, and even the words themselves, would be associated and connected with one another in a quite peculiar manner” (p. 10).

The authors grouped the examples of speech-mistakes collected by them first according to purely descriptive view-points, such as interchangings (*e.g.*, the Milo of Venus instead of the Venus of Milo), as anticipations (*e.g.*, the shoes made her sorft … the shoes made her feet sore), as echoes and post positions, as contaminations (*e.g.*, “I will soon him home,” instead of “I will soon go home and I will see him”), and substitutions (*e.g.*, “he entrusted his money to a savings crank,” instead of “a savings bank”). [1] Besides these principal categories there are some others of lesser importance (or of lesser significance for our purpose). In this grouping it makes no difference whether the transposition, disfigurement, fusion, etc., affects single sounds of the word or syllables, or whole words of the concerned sentence.

To explain the various forms of mistakes in speech, Meringer assumes a varied psychic value of phonetics. As soon as the innervation affects the first syllable of a word, or the first word of a sentence, the stimulating process immediately strikes the succeeding sounds, and the following words, and in so far as these innervations are synchronous they may effect some changes in one another. The stimulus of the psychically more intensive sound “rings” before or continues echoing, and thus disturbs the less important process of innervation. It is necessary therefore to

determine which are the most important sounds of a word. Meringer states: “If one wishes to know which sound of a word possesses the greatest intensity he should examine himself while searching for a forgotten word, for example, a name. That which first returns to consciousness invariably had the greatest intensity prior to the forgetting (p. 160). Thus the most important sounds are the initial sound of the root-syllable and the initial sound of the word itself, as well as one or another of the accentuated vowels” (p. 162).

Here I cannot help voicing a contradiction. Whether or not the initial sound of the name belongs to the most important elements of the word, it is surely not true that in the case of the forgetting of the word it first returns to consciousness; the above rule is therefore of no use. When we observe ourselves during the search for a forgotten name we are comparatively often forced to express the opinion that it begins with a certain letter. This conviction proves to be as often unfounded as founded. Indeed, I would even go so far as to assert that in the majority of cases one reproduces a false initial sound. Also in our example *Signorelli* the substitutive name lacked the initial sound, and the principal syllables were lost; on the other hand, the less important pair of syllables *elli* returned to consciousness in the substitutive name *Botticelli.*

How little substitutive names respect the initial sound of the lost names may be learned from the following case. One day I found it impossible to recall the name of the small country whose capital is Monte Carlo. The substitutive names were as follows: *Piedmont, Albania, Montevideo, Colico.* In place of Albania *Montenegro* soon appeared, and then it struck me that the syllable *Mont* (pronounced *Mon*) occurred in all but the last of the substitutive names. It thus became easy for me to find from the name of Prince Albert the forgotten name *Monaco. Colico* practically imitates the syllabic sequence and rhythm of the forgotten name.

If we admit the conjecture that a mechanism similar to that pointed out in the forgetting of names may also play a part in the phenomena of speech-blunders, we are then led to a better founded judgment of cases of speech-blunders. The speech disturbance which manifests itself as a speech-blunder may in the first place be caused by the influence of another component of the same speech, that is through a fore-sound or an echo, or through another meaning within the sentence or context which differs from that which the speaker wishes to utter. In the second place, however, the

disturbance could be brought about analogously to the process in the case *Signorelli*, through influences outside this word, sentence or context, from elements which we did not intend to express, and of whose incitement we became conscious only through the disturbance. In both modes of origin of the mistake in speech the common element lies in the simultaneity of the stimulus, while the differentiating elements lie in the arrangement within or without the same sentence or context.

The difference does not at first appear as wide as when it is taken into consideration in certain conclusions drawn from the symptomatology of speech-mistakes. It is clear, however, that only in the first case is there a prospect of drawing conclusions from the manifestations of speech-blunders concerning a mechanism which connects together sounds and words for the reciprocal influence of their articulation; that is, conclusions such as the philologist hopes to gain from the study of speech-blunders. In the case of disturbance through influence outside of the same sentence or context, it would before all be a question of becoming acquainted with the disturbing elements, and then the question would arise whether the mechanism of this disturbance cannot also suggest the probable laws of the formation of speech.

We cannot maintain that Meringer and Mayer have overlooked the possibility of speech disturbance through "complicated psychic influences," that is, through elements outside of the same word or sentence or the same sequence of words. Indeed, they must have observed that the theory of the psychic variation of sounds applies, strictly speaking, only to the explanation of sound disturbances as well as to fore-sounds and after-sounds. Where the word disturbances cannot be reduced to sound disturbances, as, for example, in the substitutions and contaminations of words, they, too, have without hesitation sought the cause of the mistake in speech outside of the intended context, and proved this state of affairs by means of fitting examples. [2] According to the author's own understanding it is some similarity between a certain word in the intended sentence and some other not intended, which allows the latter to assert itself in consciousness by causing a disfigurement, a composition, or a compromise formation (contamination).

Now, in my work on the *Interpretation of Dreams* I have shown the part played by the process of condensation in the origin of the so-called manifest contents of the dream from the latent thoughts of the dream. Any

similarity of objects or of word-presentations between two elements of the unconscious material is taken as a cause for the formation of a third, which is a composite or compromise formation. This element represents both components in the dream content, and in view of this origin it is frequently endowed with numerous contradictory individual determinants. The formation of substitutions and contaminations in speech-mistakes is, therefore, the beginning of that work of condensation which we find taking a most active part in the construction of the dream.

In a small essay destined for the general reader, [3] Meringer advanced a theory of very practical significance for certain cases of interchanging of words, especially for such cases where one word is substituted by another of opposite meaning. He says: “We may still recall the manner in which the President of the Austrian House of Deputies opened the session some time ago: ‘Honoured Sirs! I announce the presence of so and so many gentlemen, and therefore declare the session as “closed”’!” The general merriment first attracted his attention and he corrected his mistake. In the present case the probable explanation is that the President wished himself in a position to close this session, from which he had little good to expect, and the thought broke through at least partially — a frequent manifestation — resulting in his use of “closed” in place of “opened,” that is, the opposite of the statement intended. Numerous observations have taught me, however, that we frequently interchange contrasting words; they are already associated in our speech consciousness; they lie very close together and are easily incorrectly evoked.

Still, not in all cases of contrast substitution is it so simple as in the example of the President as to appear plausible that the speech-mistake occurs merely as a contradiction which arises in the inner thought of the speaker opposing the sentence uttered. We have found the analogous mechanism in the analysis of the example *aliquis;* there the inner contradiction asserts itself in the form of forgetting a word instead of a substitution through its opposite. But in order to adjust the difference we may remark that the little word *aliquis* is incapable of a contrast similar to “closing” and “opening,” and that the word “opening” cannot be subject to forgetting on account of its being a common component of speech.

Having been shown by the last examples of Merinzer and Mayer that speech disturbance may be caused through the influence of fore-sounds, after-sounds, words from the same sentence that were intended for

expression, as well as through the effect of words outside the sentence intended, *the stimulus of which would otherwise not have been suspected*, we shall next wish to discover whether we can definitely separate the two classes of mistakes in speech, and how we can distinguish the example of the one from a case of the other class.

But at this stage of the discussion we must also think of the assertions of Wundt, who deals with the manifestations of speech-mistakes in his recent work on the development of language. [4] Psychic influences, according to Wundt, never lack in these as well as in other phenomena related to them. "The uninhibited stream of *sound* and *word associations* stimulated by spoken sounds belongs here in the first place as a positive determinant. This is supported as a negative factor by the relaxation or suppression of the influences of the will which inhibit this stream, and by the active attention which is here a function of volition. Whether that play of association manifests itself in the fact that a coming sound is anticipated or a preceding sound reproduced, or whether a familiar practised sound becomes intercalated between others, or finally, whether it manifests itself in the fact that altogether different sounds associatively related to the spoken sounds act upon these — all these questions designate only differences in the direction, and at most in the play of the occurring associations but not in the general nature of the same. In some cases it may be also doubtful to which form a certain disturbance may be attributed, or whether it would not be more correct to refer such disturbance to a concurrence of many motives, *following the principle of the complication of causes* [5] (cf. pp. 380–81)."

I consider these observations of Wundt as absolutely justified and very instructive. Perhaps we could emphasize with even greater firmness than Wundt that the positive factor favouring mistakes in speech (the uninhibited stream of associations, and its negative, the relaxation of the inhibiting attention) regularly attain synchronous action, so that both factors become only different determinants of the same process. With the relaxation, or, more unequivocally expressed, *through* this relaxation, of the uninhibiting attention the uninhibited stream of associations becomes active.

Among the examples of the mistakes in speech collected by me I can scarcely find one in which I would be obliged to attribute the speech disturbance simply and solely to what Wundt calls "contact effect of

sound." Almost invariably I discover besides this a disturbing influence of something outside of the intended speech. The disturbing element is either a single unconscious thought, which comes to light through the speech-blunder, and can only be brought to consciousness through a searching analysis, or it is a more general psychic motive, which directs itself against the entire speech.

(*Example a*) Seeing my daughter make an unpleasant face while biting into an apple, I wished to quote the following couplet: —

"The ape he is a funny sight,
When in the apple he takes a bite."

But I began: "The apel…" This seems to be a contamination of "ape" and "apple" (compromise formation), or it may be also conceived as an anticipation of the prepared "apple." The true state of affairs, however, was this: I began the quotation once before, and made no mistake the first time. I made the mistake only during the repetition, which was necessary because my daughter, having been distracted from another side, did not listen to me. This repetition with the added impatience to disburden myself of the sentence I must include in the motivation of the speech-blunder, which represented itself as a function of condensation.

(*b*) My daughter said, "I wrote to Mrs. Schresinger." The woman's name was Schlesinger. This speech-blunder may depend on the tendency to facilitate articulation. I must state, however, that this mistake was made by my daughter a few moments after I had said *apel* instead of *ape.* Mistakes in speech are in a great measure contagious; a similar peculiarity was noticed by Meringer and Mayer in the forgetting of names. I know of no reason for this psychic contagiousness.

(*c*) "I *sut* up like a pocket-knife," said a patient in the beginning of treatment, instead of "I *shut* up." This suggests a difficulty of articulation which may serve as an excuse for the interchanging of sounds. When her attention was called to the speech-blunder, she promptly replied, "Yes, that happened because you said *'earnesht'* instead of *'earnest.'*" As a matter of fact I received her with the remark, "To-day we shall be in earnest" (because it was the last hour before her discharge from treatment), and I jokingly changed the word into *earnesht.* In the course of the hour she repeatedly made mistakes in speech, and I finally observed that it was not

only because she imitated me but because she had a special reason in her unconscious to linger at the word earnest (Ernst) as a name. [6]

(*d*) A woman, speaking about a game invented by her children and called by them “the man in the box,” said “the manx in the boc.” I could readily understand her mistake. It was while analysing her dream, in which her husband is depicted as very generous in money matters — just the reverse of reality — that she made this speech-blunder. The day before she had asked for a new set of furs, which her husband denied her, claiming that he could not afford to spend so much money. She upbraided him for his stinginess, “for putting away so much into the strongbox,” and mentioned a friend whose husband has not nearly his income, and yet he presented his wife with a *mink* coat for her birthday. The mistake is now comprehensible. The word *manx* (*manks*) reduces itself to the “minks” which she longs for, and the *box* refers to her husband’s stinginess.

(*e*) A similar mechanism is shown in the mistake of another patient whose memory deserted her in the midst of a long-forgotten childish reminiscence. Her memory failed to inform her on what part of the body the prying and lustful hand of another had touched her. Soon thereafter she visited one of her friends, with whom she discussed summer homes. Asked where her cottage in M. was located, she answered, “Near the *mountain loin”* instead of *“mountain lane.”*

(*f*) Another patient, whom I asked at the end of her visit how her uncle was, answered: “I don’t know, I only see him now *in flagranti.”*

The following day she said, “I am really ashamed of myself for having given you yesterday such a stupid answer. Naturally you must have thought me a very uneducated person who always mistakes the meaning of foreign words. I wished to say *en passant.”* We did not know at the time where she got the incorrectly used foreign words, but during the same session she reproduced a reminiscence as a continuation of the theme from the previous day, in which being caught *in flagranti* played the principal part. The mistake of the previous day had therefore anticipated the recollection, which at that time had not yet become conscious.

(*g*) In discussing her summer plans, a patient said, “I shall remain most of the summer in *Elberlon.”* She noted her mistake, and asked me to analyse it. The associations to *Elberlon* elicited: seashore on the Jersey coast — summer resort — vacation travelling. This recalled travelling in Europe with her cousin, a topic which we had discussed the day before

during the analysis of a dream. The dream dealt with her dislike for this cousin, and she admitted that it was mainly due to the fact that the latter was the favourite of the man whom they met together while travelling abroad. During the dream analysis she could not recall the name of the city in which they met this man, and I did not make any effort at the time to bring it to her consciousness, as we were engrossed in a totally different problem. When asked to focus her attention again on Elberlon and reproduce her associations, she said, "It brings to mind *Elberlawn — lawn — field —* and *Elberfield." Elberfeld* was the lost name of the city in Germany. Here the mistake served to bring to consciousness in a concealed manner a memory which was connected with a painful feeling.

(*h*) A woman said to me, "If you wish to buy a carpet, go to *Merchant* (Kaufmann) in *Matthew Street* (Mathäusgasse)." I repeated, "Then at Matthew's — I mean at Merchant's — —" It would seem that my repeating of one name in place of the other was simply the result of distraction. The woman's remark really did distract me, as she turned my attention to something else much more vital to me than carpet. In Matthew Street stands the house in which my wife lived as a bride. The entrance to the house was in another street, and now I noticed that I had forgotten its name and could only recall it through a roundabout method. The name Matthew, which kept my attention, is thus a substitutive name for the forgotten name of the street. It is more suitable than the name Merchant, for Matthew is exclusively the name of a person, while Merchant is not. The forgotten street, too, bears the name of a person: *Radetzky.*

(*i*) A patient consulted me for the first time, and from her history it became apparent that the cause of her nervousness was largely an unhappy married life. Without any encouragement she went into details about her marital troubles. She had not lived with her husband for about six months, and she saw him last at the theatre, when she saw the play *Officer 606.* I called her attention to the mistake, and she immediately corrected herself, saying that she meant to say *Officer 666* (the name of a recent popular play). I decided to find out the reason for the mistake, and as the patient came to me for analytic treatment, I discovered that the immediate cause of the rupture between herself and husband was the disease which is treated by "606." [7]

(*k*) Before calling on me a patient telephoned for an appointment, and also wished to be informed about my consultation fee. He was told that the

first consultation was ten dollars; after the examination was over he again asked what he was to pay, and added: “I don’t like to owe money to any one, especially to doctors; I prefer to pay right away.” Instead of *pay* he said *play.* His last voluntary remarks and his mistake put me on my guard, but after a few more uncalled-for remarks he set me at ease by taking money from his pocket. He counted four paper dollars and was very chagrined and surprised because he had no more money with him, and promised to send me a cheque for the balance. I was sure that his mistake betrayed him, that he was only *playing* with me, but there was nothing to be done. At the end of a few weeks I sent him a bill for the balance, and the letter was returned to me by the post-office authorities marked “Not found.”

(*l*) Miss X. spoke very warmly of Mr. Y., which was rather strange, as before this she had always expressed her indifference, not to say her contempt, for him. On being asked about this sudden change of heart she said: “I really never had anything against him; he was always nice to me, but I never gave him the chance to cultivate my acquaintance.” She said “cuptivate.” This neologism was a contamination of *cultivate* and *captivate,* and foretold the coming betrothal.

(*m*) An illustration of the mechanisms of contamination and condensation will be found in the following *lapsus linguæ.* Speaking of Miss Z., Miss W. depicted her as a very “straitlaced” person who was not given to levities, etc. Miss X. thereupon remarked: “Yes, that is a very characteristic description, she always appealed to me as very *‘straicet-brazed.’”* Here the mistake resolved itself into *straitlaced* and *brazen-faced,* which corresponded to Miss W.’s opinion of Miss Z.

(*n*) I shall quote a number of examples from a paper by my colleague, Dr. W. Stekel, which appeared in the Berlin *Tageblatt* of January, 1904, entitled “Unconscious Confessions.”

“An unpleasant trick of my unpleasant thoughts was revealed by the following example: To begin with, I may state that in my capacity as a physician I never consider my remuneration, but always keep in view the patient’s interest only: this goes without saying. I was visiting a patient who was convalescing from a serious illness. We had passed through hard days and nights. I was happy to find her improved, and I portrayed to her the pleasures of a sojourn in Abbazia, concluding with: ‘If as I hope, you

will *not* soon leave your bed.' This obviously came from an unconscious selfish motive, to be able to continue treating this wealthy patient, a wish which is entirely foreign to my waking consciousness, and which I would reject with indignation."

(*o*) Another example (Dr. W. Stekel): "My wife engaged a French governess for the afternoons, and later, coming to a satisfactory agreement, wished to retain her testimonials. The governess begged to be allowed to keep them, saying, 'Je cherche encore pour les *après-midis* — pardons, pour les *avant-midis.'* She apparently intended to seek another place which would perhaps offer more profitable arrangements — an intention which she carried out."

(*p*) I was to give a lecture to a woman. Her husband, upon whose request this was done, stood behind the door listening. At the end of my sermonizing, which had made a visible impression, I said: "Good-bye, sir!" To the experienced person I thus betrayed the fact that the words were directed towards the husband; that I had spoken to oblige him.

(*q*) Dr. Stekel reports about himself that he had under treatment at the same time two patients from Triest, each of whom he always addressed incorrectly. "Good morning, Mr. Peloni!" he would say to Askoli, and to Peloni, "Good morning, Mr. Askoli!" He was at first inclined to attribute no deeper motive to this mistake, but to explain it through a number of similarities in both persons. However, he easily convinced himself that here the interchange of names bespoke a sort of boast — that is, he was acquainting each of his Italian patients with the fact that neither was the only resident of Triest who came to Vienna in search of his medical advice.

(*r*) Two women stopped in front of a drugstore, and one said to her companion, "If you will wait a few *moments* I'll soon be back," but she said *movements* instead. She was on her way to buy some castoria for her child.

(*s*) Mr. L., who is fonder of being called on than of calling, spoke to me through the telephone from a nearby summer resort. He wanted to know when I would pay him a visit. I reminded him that it was his turn to visit me, and called his attention to the fact that, as he was the happy possessor of an automobile, it would be easier for him to call on me. (We were at different summer resorts, separated by about one half-hour's railway trip.) He gladly promised to call, and asked: "How about Labour Day

(September 1st), will it be convenient for you?" When I answered affirmatively, he said, "Very well, then, put me down for *Election* Day" (November). His mistake was quite plain. He likes to visit me, but it was inconvenient to travel so far. In November we would both be in the city. My analysis proved correct.

(*t*) A friend described to me a nervous patient, and wished to know whether I could benefit him. I remarked: "I believe that in time I can remove all his symptoms by psychoanalysis, because it is a durable case," wishing to say "curable"!

(*u*) I repeatedly addressed my patient as Mrs. Smith, her married daughter's name, when her real name is Mrs. James. My attention having been called to it, I soon discovered that I had another patient of the same name who refused to pay for the treatment. Mrs. Smith was also my patient and paid her bills promptly.

(*v*) A *lapsus linguæ* sometimes stands for a particular characteristic. A young woman, who is the domineering spirit in her home, said of her ailing husband that he had consulted the doctor about a wholesome diet for himself, and then added: "The doctor said that diet has nothing to do with his ailments, and that he can eat and drink what *I* want."

(*w*) I cannot omit this excellent and instructive example, although, according to my authority, it is about twenty years old. A lady once expressed herself in society — the very words show that they were uttered with fervour and under the pressure of a great many secret emotions: "Yes, a woman must be pretty if she is to please the men. A man is much better off. As long as he has *five* straight limbs, he needs no more!"

This example affords us a good insight into the intimate mechanisms of a mistake in speech by means of condensation and contamination (cf. p. 72). It is quite obvious that we have here a fusion of two similar modes of expression: —

"As long as he has his four *straight limbs."*

"As long as he has all his *five senses."*

Or the term "straight" may be the common element of the two intended expressions: —

"As long as he has his *straight* limbs."

"All five should be *straight."*

It may also be assumed that both modes of expression — viz., those of the five senses and those of the straight five — have co-operated to introduce into the sentence about the straight limbs first a number and then the mysterious five instead of the simple four. But this fusion surely would not have succeeded if it had not expressed good sense in the form resulting from the mistake; if it had not expressed a cynical truth which, naturally, could not be uttered unconcealed, coming as it did from a woman.

Finally, we shall not hesitate to call attention to the fact that the woman's saying, following its wording, could just as well be an excellent witticism as a jocose speech-blunder. It is simply a question whether she uttered these words with conscious or unconscious intention. The behaviour of the speaker in this case certainly speaks against the conscious intention, and thus excludes wit.

(*x*) Owing to similarity of material, I add here another case of speech-blunder, the interpretation of which requires less skill. A professor of anatomy strove to explain the nostril, which, as is known, is a very difficult anatomical structure. To his question whether his audience grasped his ideas he received an affirmative reply. The professor, known for his self-esteem, thereupon remarked: "I can hardly believe this, for the number of people who understand the nostril, even in a city of millions like Vienna, can be counted *on a finger* — pardon me, I meant to say *on the fingers* of a hand."

(*y*) I am indebted to Dr. Alf. Robitsek, of Vienna, for calling my attention to two speech-blunders from an old French author, which I shall reproduce in the original.

Brantôme (1527–1614), *Vies des Dames galantes*, Discours second: "Si ay-je cogneu une très belle et honneste dame de par le monde, qui, devisant avec un honneste gentilhomme de la cour des affaires de la guerre durant ces civiles, elle luy dit: 'J'ay ouy dire que le roy a faiet rompre tous les c —— de ce pays là.' Elle vouloit dire le ponts. Pensez que, venant de coucher d'avec son mary, ou songeant à son amant, elle avoit encor ce nom frais en la bouche; et le gentilhomme s'en eschauffer en amours d'elle pour ce mot.

"Une autre dame que j'ai cogneue, entretenant une autre grand dame plus qu'elle, et luy louant et exaltant ses beautez, elle luy dit après: 'Non, madame, ce que je vous en dis, ce n'est point pour vous *adultérer;* voulant

dire *adulater,* comme elle le rhabilla ainsi: pensez qu'elle songeoit à adultérer."

In the psychotherapeutic procedure which I employ in the solution and removal of neurotic symptoms, I am often confronted with the task of discovering from the accidental utterances and fancies of the patient the thought contents, which, though striving for concealment, nevertheless unintentionally betray themselves. In doing this the mistakes often perform the most valuable service, as I can show through most convincing and still most singular examples.

For example, patients speak of an aunt and later, without noting the mistake, call her "my mother," or designate a husband as a "brother." In this way they attract my attention to the fact that they have "identified" these persons with each other, that they have placed them in the same category, which for their emotional life signifies the recurrence of the same type. Or, a young man of twenty years presents himself during my office hours with these words: "I am the father of N. N., whom you have treated — pardon me, I mean the brother; why, he is four years older than I." I understand through this mistake that he wishes to express that, like the brother, he, too, is ill through the fault of the father; like his brother, he wishes to be cured, but that the father is the one most in need of treatment. At other times an unusual arrangement of words, or a forced expression, is sufficient to disclose in the speech of the patient the participation of a repressed thought having a different motive.

Hence, in coarse as well as in finer speech disturbances, which may, nevertheless, be subsumed as "speech-blunders," I find that it is not the contact effects of the sound, but the thoughts outside the intended speech, which determine the origin of the speech-blunder, and also suffice to explain the newly formed mistakes in speech. I do not doubt the laws whereby the sounds produce changes upon one another; but they alone do not appear to me sufficiently forcible to mar the correct execution of speech. In those cases which I have studied and investigated more closely they merely represent the preformed mechanism, which is conveniently utilized by a more remote psychic motive. The latter does not, however, form a part of the sphere of influence of these sound relations. *In a large number of substitutions caused by mistakes in talking there is an entire absence of such phonetic laws.* In this respect I am in full accord with

Wundt, who likewise assumes that the conditions underlying speech-blunders are complex and go far beyond the contact effect of the sounds.

If I accept as certain “these more remote psychic influences,” following Wundt’s expression, there is still nothing to detain me from conceding also that in accelerated speech, with a certain amount of diverted attention the causes of speech-blunder may be easily limited to the definite law of Meringer and Mayer. However, in a number of examples gathered by these authors a more complicated solution is quite apparent.

In some forms of speech-blunders we may assume that the disturbing factor is the result of striking against obscene words and meanings. The purposive disfigurement and distortion of words and phrases, which is so popular with vulgar persons, aims at nothing else but the employing of a harmless motive as a reminder of the obscene, and this sport is so frequent that it would not be at all remarkable if it appeared unintentionally and contrary to the will.

I trust that the readers will not depreciate the value of these interpretations, for which there is no proof, and of these examples which I have myself collected and explained by means of analysis. But if secretly I still cherish the expectation that even the apparently simple cases of speech-blunder will be traced to a disturbance caused by a half-repressed idea outside of the intended context, I am tempted to it by a noteworthy observation of Meringer. This author asserts that it is remarkable that nobody wishes to admit having made a mistake in speaking. There are many intelligent and honest people who are offended if we tell them that they made a mistake in speaking. I would not risk making this assertion as general as does Meringer, using the term “nobody.” But the emotional trace which clings to the demonstration of the mistake, which manifestly belongs to the nature of shame, has its significance. It may be classed with the anger displayed at the inability to recall a forgotten name, and with the surprise at the tenaciousness of an apparently indifferent memory, and it invariably points to the participation of a motive in the formation of the disturbance.

The distorting of names amounts to an insult when done intentionally, and could have the same significance in a whole series of cases where it appears as unintentional speech-blunders. The person who, according to Mayer’s report, once said “Freuder” instead of “Freud,” because shortly before he pronounced the name “Breuer” (p. 38), and who at another time

spoke of the “Freuer-Breudian” method (p. 28), was certainly not particularly enthusiastic over this method. Later, under the mistakes in writing, I shall report a case of name disfigurement which certainly admits of no other explanation. [8]

As a disturbing element in these cases there is an intermingling of a criticism which must be omitted, because at the time being it does not correspond to the intention of the speaker.

Or it may be just the reverse; the substituted name, or the adoption of the strange name, signifies an appreciation of the same. The identification which is brought about by the mistake is equivalent to a recognition which for the moment must remain in the background. An experience of this kind from his schooldays is related by Dr. Ferenczi: —

“While in my first year at college I was obliged to recite a poem before the whole class. It was the first experience of the kind in my life, but I was well prepared. As soon as I began my recitation I was dismayed at being disturbed by an outburst of laughter. The professor later explained to me this strange reception. I started by giving the title ‘From the Distance,’ which was correct, but instead of giving the name of the real author, I mentioned — my own. The name of the poet is Alexander Petöfi. The identity of the first name with my own favoured the interchange of names, but the real reason was surely the fact that I identified myself at that time with the celebrated poet-hero. Even consciously I entertained for him a love and respect which verged on adoration. The whole ambition-complex hides itself under this faulty action.”

A similar identification was reported to me concerning a young physician who timidly and reverently introduced himself to the celebrated Virchow with the following words: “I am Dr. Virchow.” The surprised professor turned to him and asked, “Is your name also Virchow?” I do not know how the ambitious young man justified his speech-blunder, whether he thought of the charming excuse that he imagined himself so insignificant next to this big man that his own name slipped from him, or whether he had the courage to admit that he hoped that he, too, would some day be as great a man as Virchow, and that the professor should therefore not treat him in too disparaging a manner. One or both of these thoughts may have put this young man in an embarrassing position during the introduction.

Owing to very personal motives I must leave it undecided whether a similar interpretation may also apply in the case to be cited. At the International Congress in Amsterdam, in 1907, my theories of hysteria were the subject of a lively discussion. One of my most violent opponents, in his diatribe against me, repeatedly made mistakes in speech in such a manner that he put himself in my place and spoke in my name. He said, for example, “Breuer and I, as is well known, have demonstrated,” etc., when he wished to say “Breuer and Freud.” The name of this opponent does not show the slightest sound similarity to my own. From this example, as well as from other cases of interchanging names in speech-blunders, we are reminded of the fact that the speech-blunder can fully forego the facility afforded to it through similar sounds, and can achieve its purpose if only supported in content by concealed relations.

In other and more significant cases it is a self-criticism, an internal contradiction against one’s own utterance, which causes the speech-blunder, and even forces a contrasting substitution for the one intended. We then observe with surprise how the wording of an assertion removes the purpose of the same, and how the error in speech lays bare the inner dishonesty. Here the *lapsus linguæ* becomes a mimicking form of expression, often, indeed, for the expression of what one does not wish to say. It is thus a means of self-betrayal.

Brill relates: “I had recently been consulted by a woman who showed many paranoid trends, and as she had no relatives who could co-operate with me, I urged her to enter a State hospital as a voluntary patient. She was quite willing to do so, but on the following day she told me that her friends with whom she leased an apartment objected to her going to a hospital, as it would interfere with their plans, and so on. I lost patience and said: ‘There is no use listening to your friends who know nothing about your mental condition; you are quite *incompetent* to take care of your own affairs.’ I meant to say ‘competent.’ Here the *lapsus linguæ* expressed my true opinion.”

Favoured by chance the speech material often gives origin to examples of speech-blunders which serve to bring about an overwhelming revelation or a full comic effect, as shown by the following examples reported by Brill: —

“A wealthy but not very generous host invited his friends for an evening dance. Everything went well until about 11.30 p.m., when there

was an intermission, presumably for supper. To the great disappointment of most of the guests there was no supper; instead, they were regaled with thin sandwiches and lemonade. As it was close to Election day the conversation centred on the different candidates; and as the discussion grew warmer, one of the guests, an ardent admirer of the Progressive Party candidate, remarked to the host: ‘You may say what you please about Teddy, but there is one thing — he can always be relied upon; he always gives you a *square meal,’* wishing to say *square deal*. The assembled guests burst into a roar of laughter, to the great embarrassment of the speaker and the host, who fully understood each other.”

“While writing a prescription for a woman who was especially weighed down by the financial burden of the treatment, I was interested to hear her say suddenly: ‘Please do not give me *big bills*, because I cannot swallow them.’ Of course she meant to say *pills.”*

The following example illustrates a rather serious case of self-betrayal through a mistake in talking. Some accessory details justify full reproduction as first printed by Dr. A. A. Brill. [9]

“While walking one night with Dr. Frink we accidentally met a colleague, Dr. P., whom I had not seen for years, and of whose private life I knew nothing. We were naturally very pleased to meet again, and on my invitation he accompanied us to a café, where we spent about two hours in pleasant conversation. To my question as to whether he was married he gave a negative answer, and added, ‘Why should a man like me marry?’

“On leaving the café, he suddenly turned to me and said: ‘I should like to know what you would do in a case like this: I know a nurse who was named as co-respondent in a divorce case. The wife sued the husband for divorce and named her as co-respondent, and *he* got the divorce.’ I interrupted him, saying, ‘You mean *she* got the divorce.’ He immediately corrected himself, saying, ‘Yes, she got the divorce,’ and continued to tell how the excitement of the trial had affected this nurse to such an extent that she became nervous and took to drink. He wanted me to advise him how to treat her.

“As soon as I had corrected his mistake I asked him to explain it, but, as is usually the case, he was surprised at my question. He wanted to know whether a person had no right to make mistakes in talking. I explained to him that there is a reason for every mistake, and that if he had not told me that he was unmarried, I would say that he was the hero of the divorce case

in question, and that the mistake showed that he wished he had obtained the divorce instead of his wife, so as not to be obliged to pay alimony and to be permitted to marry again in New York State.

"He stoutly denied my interpretation, but his emotional agitation, followed by loud laughter, only strengthened my suspicions. To my appeal that he should tell the truth 'for science' sake,' he said, 'Unless you wish me to lie you must believe that I was never married, and hence your psychoanalytic interpretation is all wrong.' He, however, added that it was dangerous to be with a person who paid attention to such little things. Then he suddenly remembered that he had another appointment and left us.

"Both Dr. Frink and I were convinced that my interpretation of his *lapsus linguæ* was correct, and I decided to corroborate or disprove it by further investigation. The next day I found a neighbour and old friend of Dr. P., who confirmed my interpretation in every particular. The divorce was granted to Dr. P.'s wife a few weeks before, and a nurse was named as co-respondent. A few weeks later I met Dr. P., and he told me that he was thoroughly convinced of the Freudian mechanisms."

The self-betrayal is just as plain in the following case reported by Otto Rank: —

A father who was devoid of all patriotic feeling and desirous of educating his children to be just as free from this superfluous sentiment, reproached his sons for participating in a patriotic demonstration, and rejected their reference to a similar behaviour of their uncle with these words: "You are not obliged to imitate him; why, he is an *idiot."* The astonished features of the children at their father's unusual tone aroused him to the fact that he had made a mistake, and he remarked apologetically, "Of course, I wished to say *patriot."*

When such a speech-blunder occurs in a serious squabble and reverses the intended meaning of one of the disputants, at once it puts him at a disadvantage with his adversary — a disadvantage which the latter seldom fails to utilize.

This clearly shows that although people are unwilling to accept the theory of my conception and are not inclined to forego the convenience that is connected with the tolerance of a faulty action, they nevertheless interpret speech-blunders and other faulty acts in a manner similar to the one presented in this book. The merriment and derision which are sure to

be evoked at the decisive moment through such linguistic mistakes speak conclusively against the generally accepted convention that such a speech-blunder is a *lapsus linguæ* and psychologically of no importance. It was no less a man than the German Chancellor, Prince Bülow, who endeavoured to save the situation through such a protest when the wording of his defence of his Emperor (November, 1907) turned into the opposite through a speech-blunder.

"Concerning the present, the new epoch of Emperor Wilhelm II, I can only repeat what I said a year ago, that *it would be unfair and unjust to speak of a coterie of responsible advisers around our Emperor* (loud calls, 'Irresponsible!') — to speak of *irresponsible* advisers. Pardon the *lapsus linguæ*" (hilarity).

A nice example of speech-blunder, which aims not so much at the betrayal of the speaker as at the enlightenment of the listener outside the scene, is found in Wallenstein (*Piccolomini,* Act I, Scene 5), and shows us that the poet who here uses this means is well versed in the mechanism and intent of speech-blunders. In the preceding scene Max Piccolomini was passionately in favour of the ducal party, and was enthusiastic over the blessings of the peace which became known to him in the course of a journey while accompanying Wallenstein's daughter to the encampment. He leaves his father and the Court ambassador, Questenberg, in great consternation. The scene proceeds as follows: —

QUESTENBERG. Woe unto us! Are matters thus? Friend, should we allow him to go there with this false opinion, and not recall him at once in order to open his eyes instantly.

OCTAVIO (*rousing himself from profound meditation*). He has already opened mine, and I see more than pleases me.

QUESTENBERG. What is it, friend?

OCTAVIO. A curse on that journey!

QUESTENBERG. Why? What is it?

OCTAVIO. Come! I must immediately follow the unlucky trail, must see with my own eyes — come —— (*Wishes to lead him away.*)

QUESTENBERG. What is the matter? Where?

OCTAVIO (*urging*). To *her!*

QUESTENBERG. To —— ?

OCTAVIO (*corrects himself*). To the duke! Let us go, etc.

The slight speech-blunder *to her* in place of *to him* is meant to betray to us the fact that the father has seen through his son's motive for espousing the other cause, while the courtier complains that "he speaks to him altogether in riddles."

Another example wherein a poet makes use of a speech-blunder was discovered by Otto Rank in Shakespeare. I quote Rank's report from the *Zentralblatt für Psychoanalyse,* I. 3.

"A poetic speech-blunder, very delicately motivated and technically remarkably well utilized, which, like the one pointed out by Freud in Wallenstein (*Zur Psychopathologie des Alltagslebens,* 2nd Edition, p. 48), not only shows that poets knew the mechanism and sense of this error, but also presupposes an understanding of it on the part of the hearer, can be found in Shakespeare's *Merchant of Venice* (Act III, Scene 2). By the will of her father, Portia was bound to select a husband through a lottery. She escaped all her distasteful suitors by lucky chance. When she finally found in Bassanio the suitor after her own heart, she had cause to fear lest he, too, should draw the unlucky lottery. In the scene she would like to tell him that even if he chose the wrong casket, he might, nevertheless, be sure of her love. But she is hampered by her vow. In this mental conflict the poet puts these words in her mouth, which were directed to the welcome suitor: —

"There is something tells me (but it is not love),
I would not lose you; and you know yourself
Hate counsels not in such a quality.
But lest you should not understand me well
(And yet a maiden hath no tongue but thought),
I would detain you here some month or two,
Before you venture for me. I could teach you
How to choose right, but then I am forsworn;
So will I never be; so may you miss me;
But if you do, you'll make me wish a sin,
That I had been forsworn. Beshrew your eyes,
They have o'erlooked me, and divided me:
One half of me is yours, the other half yours —
Mine own, I would say; but if mine, then yours —
And so all yours."

“Just the very thing which she would like to hint to him gently, because really she should keep it from him, namely, that even before the choice she is wholly his — that she loves him, the poet, with admirable psychologic sensitiveness, allows to come to the surface in the speech-blunder. It is through this artifice that he manages to allay the intolerable uncertainty of the lover as well as the like tension of the hearer concerning the outcome of the choice.”

The interest merited by the confirmation of our conception of speech-blunders through the great poets justifies the citation of a third example which was reported by Dr. E. Jones. [10]

“Our great novelist, George Meredith, in his masterpiece, *The Egoist*, shows an even finer understanding of the mechanism. The plot of the novel is, shortly, as follows: Sir Willoughby Patterne, an aristocrat greatly admired by his circle, becomes engaged to a Miss Constantia Durham. She discovers in him an intense egoism, which he skilfully conceals from the world, and to escape the marriage she elopes with a Captain Oxford. Some years later Patterne becomes engaged to a Miss Clara Middleton, and most of the book is taken up with a detailed description of the conflict that arises in her mind on also discovering his egoism. External circumstances and her conception of honour hold her to her pledge, while he becomes more and more distasteful in her eyes. She partly confided in his cousin and secretary, Vernon Whitford, the man whom she ultimately marries, but from a mixture of motives he stands aloof.

“In the soliloquy Clara speaks as follows: ‘If some noble gentleman could see me as I am and not disdain to aid me! Oh! to be caught out of this prison of thorns and brambles. I cannot tear my own way out. I am a coward. A beckoning of a finger would change me, I believe. I could fly bleeding and through hootings to a comrade…. Constantia met a soldier. Perhaps she prayed and her prayer was answered. She did ill. But, oh, how I love her for it! His name was Harry Oxford…. She did not waver, she cut the links, she signed herself over. Oh, brave girl, what do you think of me? But I have no Harry Whitford; I am alone….’ The sudden consciousness that she had put another name for Oxford struck her a buffet, drowning her in crimson.

“The fact that both men’s names end in ‘ford’ evidently renders the confounding of them more easy, and would by many be regarded as an adequate cause for this, but the real underlying motive for it is plainly

indicated by the author. In another passage the same *lapsus* occurs, and is followed by the hesitation and change of subject that one is familiar with in psychoanalysis when a half-conscious complex is touched. Sir Willoughby patronizingly says of Whitford: ‘False alarm. The resolution to do anything unaccustomed is quite beyond poor old Vernon.’ Clara replies: ‘But if Mr. Oxford — Whitford … your swans, coming sailing up the lake; how beautiful they look when they are indignant! I was going to ask you, surely men witnessing a marked admiration for some one else will naturally be discouraged?’ Sir Willoughby stiffened with sudden enlightenment.

“In still another passage Clara, by another *lapsus*, betrays her secret wish that she was on a more intimate footing with Vernon Whitford. Speaking to a boy friend, she says, ‘Tell Mr. Vernon — tell Mr. Whitford.’”

The conception of speech-blunders here defended can be readily verified in the smallest details. I have been able to demonstrate repeatedly that the most insignificant and most natural cases of speech-blunders have their good sense, and admit of the same interpretation as the more striking examples. A patient who, contrary to my wishes but with firm personal motives, decided upon a short trip to Budapest, justified herself by saying that she was going for only three days, but she blundered and said for only three weeks. She betrayed her secret feeling that, to spite me, she preferred spending three weeks to three days in that society which I considered unfit for her.

One evening, wishing to excuse myself for not having called for my wife at the theatre, I said: “I was at the theatre at ten minutes after ten.” I was corrected: “You meant to say before ten o’clock.” Naturally I wanted to say before ten. After ten would certainly be no excuse. I had been told that the theatre programme read, “Finished before ten o’clock.” When I arrived at the theatre I found the foyer dark and the theatre empty. Evidently the performance was over earlier and my wife did not wait for me. When I looked at the clock it still wanted five minutes to ten. I determined to make my case more favourable at home, and say that it was ten minutes to ten. Unfortunately, the speech-blunder spoiled the intent and laid bare my dishonesty, in which I acknowledged more than there really was to confess.

This leads us to those speech disturbances which can no longer be described as speech-blunders, for they do not injure the individual word, but affect the rhythm and execution of the entire speech, as, for example, the stammering and stuttering of embarrassment. But here, as in the former cases, it is the inner conflict that is betrayed to us through the disturbance in speech. I really do not believe that any one will make mistakes in talking in an audience with His Majesty, in a serious love declaration, or in defending one's name and honour before a jury; in short, people make no mistakes where *they are all there*, as the saying goes. Even in criticizing an author's style we are allowed and accustomed to follow the principle of explanation, which we cannot miss in the origin of a single speech-blunder. A clear and unequivocal manner of writing shows us that here the author is in harmony with himself, but where we find a forced and involved expression, aiming at more than one target, as appropriately expressed, we can thereby recognize the participation of an unfinished and complicated thought, or we can hear through it the stifled voice of the author's self-criticism. [11]

ENDNOTES.

[5] Italics are mine.

[6] It turned out that she was under the influence of unconscious thoughts concerning pregnancy and prevention of conception. With the words "shut up like a pocket knife," which she uttered consciously as a complaint, she meant to describe the position of the child in the womb. The word "earnest" in my remark recalled to her the name (S. Ernst) of the well-known Vienna business firm in Kärthner Strasse, which used to advertise the sale of articles for the prevention of conception.

[7] Similar mistakes dealing with *Officer 666* were reported to me by other psychoanalysts.

[8] It may be observed that aristocrats in particular very frequently distort the names of the physicians they consult, from which we may conclude that inwardly they slight them, in spite of the politeness with which they are wont to greet them. I shall cite here some excellent observations concerning the forgetting of names from the works of Professor E. Jones, of Toronto: *Papers on Psycho-analysis,* chap. iii. p. 49: —

"Few people can avoid feeling a twinge of resentment when they find that their name has been forgotten, particularly if it is by some one with whom they had hoped or expected it would be remembered. They instinctively realize that if they had made a greater impression on the person's mind he would certainly have remembered them again, for the name is an integral part of the personality. Similarly, few things are more flattering to most people than to find themselves addressed by name by a great personage where they could hardly have anticipated it. Napoleon, like most leaders of men, was a master of this art. In the midst of the disastrous campaign of France in 1814, he gave an amazing proof of his memory in this direction. When in a town near Craonne, he recollected that he had met the mayor, De Bussy, over twenty years ago in the La Fère Regiment. The delighted De Bussy at once threw himself into his service with extraordinary zeal. Conversely, there is no surer way of affronting someone than by pretending to forget his name; the insinuation is thus conveyed that the person is so unimportant in our eyes that we cannot be bothered to remember his name. This device is often exploited in literature. In Turgenev's *Smoke* (p. 255) the following passage occurs: "'So you still find Baden entertaining, M'sieur — Litvinov.' Ratmirov always uttered Litvinov's surname with hesitation, every time, as though he had forgotten it, and could not at once recall it. In this way, as well as by the lofty flourish of his hat in saluting him, he meant to insult his pride." The same author, in his *Fathers and Children* (p. 107), writes: "The Governor invited Kirsanov and Bazarov to his ball, and within a few minutes invited them a second time, regarding them as brothers, and calling them Kisarov." Here the forgetting that he had spoken to them, the mistake in the names, and the inability to distinguish between the two young men, constitute a culmination of disparagement. Falsification of a name has the same signification as forgetting it; it is only a step towards complete amnesia."

VI. Mistakes in Reading and Writing

THAT the same view-points and observation should hold true for mistakes in reading and writing as for lapses in speech is not at all surprising when one remembers the inner relation of these functions. I shall here confine myself to the reports of several carefully analysed examples and shall make no attempt to include all of the phenomena.

A. Lapses in Reading.

(*a*) While looking over a number of the *Leipziger Illustrierten,* which I was holding obliquely, I read as the title of the front-page picture, "A Wedding Celebration in the Odyssey." Astonished and with my attention aroused, I moved the page into the proper position only to read correctly, "A Wedding Celebration in the Ostsee (Baltic Sea)." How did this senseless mistake in reading come about?

Immediately my thoughts turned to a book by Ruth, *Experimental Investigations of "Music Phantoms,"* etc., with which I had recently been much occupied, as it closely touched the psychologic problems that are of interest to me. The author promised a work in the near future to be called *Analysis and Principles of Dream Phenomena.* No wonder that I, having just published an *Interpretation of Dreams,* awaited the appearance of this book with the most intense interest. In Ruth's work concerning music phantoms I found an announcement in the beginning of the table of contents of the detailed inductive proof that the old Hellenic myths and traditions originated mainly from slumber and music phantoms, from dream phenomena and from deliria. Thereupon I had immediately plunged into the text in order to find out whether he was also aware that the scene where Odysseus appears before Nausicaa was based upon the common dream of nakedness. One of my friends called my attention to the clever passage in G. Keller's *Grünem Heinrich,* which explains this episode in the Odyssey as an objective representation of the dream of the mariner straying far from home. I added to it the reference to the exhibition dream of nakedness. [1]

(*b*) A woman who is very anxious to get children always reads *storks* instead of *stocks.*

(*c*) One day I received a letter which contained very disturbing news. I immediately called my wife and informed her that poor Mrs. Wm. H. was seriously ill and was given up by the doctors. There must have been a false ring to the words in which I expressed my sympathy, as my wife grew suspicious, asked to see the letter, and expressed her opinion that it could not read as stated by me, because no one calls the wife by the husband's name. Moreover, the correspondent was well acquainted with the Christian name of the woman concerned. I defended my assertion obstinately and referred to the customary visiting-cards, on which a woman designates herself by the Christian name of her husband. I was finally compelled to take up the letter, and, as a matter of fact, we read therein "Poor W. M." What is more, I had even overlooked "Poor Dr. W. M." My mistake in reading signified a spasmodic effort, so to speak, to turn the sad news from the man towards the woman. The title between the adjective and the name did not go well with my claim that the woman must have been meant. That is why it was omitted in the reading. The motive for this falsifying was not that the woman was less an object of my sympathy than the man, but the fate of this poor man had excited my fears regarding another and nearer person who, I was aware, had the same disease.

(*d*) Both irritating and laughable is a lapse in reading to which I am frequently subject when I walk through the streets of a strange city during my vacation. I then read *antiquities* on every shop sign that shows the slightest resemblance to the word; this displays the questing spirit of the collector.

(*e*) In his important work [2] Bleuler relates: "While reading I once had the intellectual feeling of seeing my name two lines below. To my astonishment I found only the words blood corpuscles. Of the many thousands of lapses in reading in the peripheral as well as in the central field of vision that I have analysed, this was the most striking case. Whenever I imagined that I saw my name, the word that induced this illusion usually showed a greater resemblance to my name than the word *bloodcorpuscles.* In most cases all the letters of my name had to be close together before I could commit such an error. In this case, however, I could readily explain the delusion of reference and the illusion. What I had just read was the end of a statement concerning a form of bad style in scientific works, a tendency from which I am not entirely free."

B. Lapses in Writing.

(*a*) On a sheet of paper containing principally short daily notes of business interest, I found, to my surprise, the incorrect date, “Thursday, October 20th,” bracketed under the correct date of the month of September. It was not difficult to explain this anticipation as the expression of a wish. A few days before I had returned fresh from my vacation and felt ready for any amount of professional work, but as yet there were few patients. On my arrival I had found a letter from a patient announcing her arrival on the 20th of October. As I wrote the same date in September I may certainly have thought “X. ought to be here already; what a pity about that whole month!” and with this thought I pushed the current date a month ahead. In this case the disturbing thought can scarcely be called unpleasant; therefore after noticing this lapse in writing, I immediately knew the solution. In the fall of the following year I experienced an entirely analogous and similarly motivated lapse in writing. E. Jones has made a study of similar cases, and found that most mistakes in writing dates are motivated.

(*b*) I received the proof sheets of my contribution to the annual report on neurology and psychiatry, and I was naturally obliged to review with special care the names of authors, which, because of the many different nationalities represented, offer the greatest difficulties to the compositor. As a matter of fact, I found some strange-sounding names still in need of correction; but, oddly enough, the compositor had corrected one single name in my manuscript, and with very good reason. I had written *Buckrhard*, which the compositor guessed to be *Burckhard*. I had praised the treatise of this obstetrician entitled *The Influence of Birth on the Origin of Infantile Paralysis*, and I was not conscious of the least enmity toward him. But an author in Vienna, who had angered me by an adverse criticism of my *Traumdeutung*, bears the same name. It was as if in writing the name Burckhard, meaning the obstetrician, a wicked thought concerning the other B. had obtruded itself. The twisting of the name, as I have already stated in regard to lapses in speech, often signifies a depreciation. [3]

(*c*) The following is seemingly a serious case of *lapsus calami*, which it would be equally correct to describe as an erroneously carried out action. I intended to withdraw from the postal savings bank the sum of 300 crowns, which I wished to send to an absent relative to enable him to take

treatment at a watering-place. I noted that my account was 4,380 crowns, and I decided to bring it down to the round sum of 4,000 crowns, which was not to be touched in the near future. After making out the regular cheque I suddenly noticed that I had written not 380 crowns, as I had intended, but exactly 438 crowns. I was frightened at the untrustworthiness of my action. I soon realized that my fear was groundless, as I had not grown poorer than I was before. But I had to reflect for quite a while in order to discover what influence diverted me from my first intention without making itself known to my consciousness.

First I got on a wrong track: I subtracted 380 from 438, but after that I did not know what to do with the difference. Finally an idea occurred to me which showed me the true connection. 438 is exactly 10 per cent. of the entire account of 4,380 crowns! But the bookseller, too, gives a 10 per cent. discount! I recalled that a few days before I had selected several books, in which I was no longer interested, in order to offer them to the bookseller for 300 crowns. He thought the price demanded too high, but promised to give me a final answer within the next few days. If he should accept my first offer he would replace the exact sum that I was to spend on the sufferer. There is no doubt that I was sorry about this expenditure. The emotion at the realization of my mistakes can be more easily understood as a fear of growing poor through such outlays. But both the sorrow over this expense and the fear of poverty connected with it were entirely foreign to my consciousness; I did not regret this expense when I promised the sum, and would have laughed at the idea of any such underlying motive. I should probably not have assigned such feelings to myself had not my psychoanalytic practice made me quite familiar with the repressed elements of psychic life, and if I had not had a dream a few days before which brought forth the same solution.

(*d*) Although it is usually difficult to find the person responsible for printers' errors, the psychologic mechanisms underlying them are the same as in other mistakes. Typographical errors also well demonstrate the fact that people are not at all indifferent to such trivialities as "mistakes," and, judging by the indignant reactions of the parties concerned, one is forced to the conclusion that mistakes are not treated by the public at large as mere accidents. This state of affairs is very well summed up in the following editorial from the *New York Times* of April 14, 1913. Not the

least interesting are the comments of the keen-witted editor, who seems to share our views: —

"A BLUNDER TRULY UNFORTUNATE.

"Typographical errors come only too frequently from even the best regulated newspaper presses. They are always humiliating, often a cause of anger, and occasionally dangerous, but now and then they are distinctly amusing. This latter quality they are most apt to have when they are made in the office of a journalistic neighbor, a fact that probably explains why we can read with smiling composure an elaborate editorial apology which appears in The Hartford Courant.

"Its able political commentator tried, the other day, to say that, 'unfortunately for Connecticut,' Ebenezer J. Hill is no longer a member of Congress. Printer and proofreader combined to deprive the adverb of its negative particle! At least the able political commentator so declares, and we wouldn't question his veracity for the world, but sorrowful experience has taught most of us that it's safer to get that sort of editorial disclaimer of responsibility into print before looking up the copy, and perhaps — just perhaps — the world-enlightener who 'knows' that he wrote 'unfortunate,' because that is what he intended to write, didn't rashly chance the discovery of his own guilt before he convicted the composing room of it.

"Be that as it may, the meaning of the sentence was cruelly changed, and a friend was grieved or offended. Not so long ago a more astonishing error than this one crept into a book review of ours — a very solemn and scientific book. It consisted of the substitution of the word 'caribou' for the word 'carbon,' in a paragraph dealing with the chemical composition of the stars. In that case the writer's fierce self-exculpation is at least highly plausible, as it seems hardly possible that he wrote 'caribou' when he intended to write 'carbon,' but even he was cautious enough to make no deep inquiry into the matter."

(*e*) I cite the following case contributed by Dr. W. Stekel, for the authenticity of which I can vouch: "An almost unbelievable example of miswriting and misreading occurred in the editing of a widely circulated weekly. It concerned an article of defence and vindication which was written with much warmth and great pathos. The editor-in-chief of the paper read the article, while the author himself naturally read it from the

manuscript and proof-sheets more than once. Everybody was satisfied, when the printer's reader suddenly noticed a slight error which had escaped the attention of all. There it was, plainly enough: 'Our readers will bear witness to the fact that we have always acted in a *selfish* manner for the good of the community.' It is quite evident that it was meant to read *unselfish.* The real thoughts, however, broke through the pathetic speech with elemental force."

(*f*) The following example of misprinting is taken from a Western gazette: The teacher was giving an instruction paper on mathematical methods, and spoke of a plan "for the instruction of youth that might be carried out *ad libidinem."*

(*g*) Even the Bible did not escape misprints. Thus we have the "Wicked Bible," so called from the fact that the negative was left out of the seventh commandment. This authorized edition of the Bible was published in London in 1631, and it is said that the printer had to pay a fine of two thousand pounds for the omission.

Another biblical misprint dates back to the year 1580, and is found in the Bible of the famous library of Wolfenbuttel, in Hesse. In the passage in Genesis where God tells Eve that Adam shall be her master and shall rule over her, the German translation is *"Und er soll dein Herr sein."* The word *Herr* (master) was substituted by *Narr,* which means fool. Newly discovered evidence seems to show that the error was a conscious machination of the printer's suffragette wife, who refused to be ruled by her husband.

(*h*) Dr. Ernest Jones reports the following case concerning A. A. Brill: "Although by custom almost a teetotaler, he yielded to a friend's importunity one evening, in order to avoid offending him, and took a little wine. During the next morning an exacerbation of an eye-strain headache gave him cause to regret this slight indulgence, and his reflection on the subject found expression in the following slip of the pen. Having occasion to write the name of a girl mentioned by a patient, he wrote not Ethel but Ethyl. [4] It happened that the girl in question was rather too fond of drink, and in Dr. Brill's mood at the time this characteristic of hers stood out with conspicuous significance." [5]

(*i*) A woman wrote to her sister, felicitating her on the occasion of taking possession of a new and spacious residence. A friend who was present noticed that the writer put the wrong address on the letter, and

what was still more remarkable was the fact that she did not address it to the previous residence, but to one long ago given up, but which her sister had occupied when she first married. When the friend called her attention to it the writer remarked, “You are right; but what in the world made me do this?” to which her friend replied: “Perhaps you begrudge her the nice big apartment into which she has just moved because you yourself are cramped for space, and for that reason you put her back into her first residence, where she was no better off than yourself.” “Of course I begrudge her the new apartment,” she honestly admitted. As an afterthought she added, “It is a pity that one is so mean in such matters.”

(*k*) Ernest Jones reports the following example given to him by Dr. A. A. Brill. In a letter to Dr. Brill a patient tried to attribute his nervousness to business worries and excitement during the cotton crisis. He went on to say: “My trouble is all due to that d —— frigid wave; there isn’t even any seed to be obtained for new crops.” He referred to a cold wave which had destroyed the cotton crops, but instead of writing “wave” he wrote “wife.” In the bottom of his heart he entertained reproaches against his wife on account of her marital frigidity and childlessness, and he was not far from the cognition that the enforced abstinence played no little part in the causation of his malady.

Omissions in writing are naturally explained in the same manner as mistakes in writing. A remarkable example of omission which is of historic importance was reported by Dr. B. Dattner. [6] In one of the legal articles dealing with the financial obligations of both countries, which was drawn up in the year 1867 during the readjustment between Austria and Hungary, the word “effective” was accidentally omitted in the Hungarian translation. Dattner thinks it probable that the unconscious desire of the Hungarian law-makers to grant Austria the least possible advantages had something to do with this omission.

Another example of omission is the following related by Brill: “A prospective patient, who had corresponded with me relative to treatment, finally wrote for an appointment for a certain day. Instead of keeping his appointment he sent regrets which began as follows: ‘Owing to *foreseen* circumstances I am unable to keep my appointment.’ He naturally meant to write *unforeseen.* He finally came to me months later, and in the course of the analysis I discovered that my suspicions at the time were justified;

there were no unforeseen circumstances to prevent his coming at that time; he was advised not to come to me. The unconscious does not lie."

Wundt gives a most noteworthy proof for the easily ascertained fact that we more easily make mistakes in writing than in speaking (*loc. cit.*, p. 374). He states: "In the course of normal conversation the inhibiting function of the will is constantly directed toward bringing into harmony the course of ideation with the movement of articulation. If the articulation following the ideas becomes retarded through mechanical causes, as in writing, such anticipations then readily make their appearance."

Observation of the determinants which favour lapses in reading gives rise to doubt, which I do not like to leave unmentioned, because I am of the opinion that it may become the starting-point of a fruitful investigation. It is a familiar fact that in reading aloud the attention of the reader often wanders from the text and is directed toward his own thoughts. The results of this deviation of attention are often such that when interrupted and questioned he cannot even state what he had read. In other words, he has read automatically, although the reading was nearly always correct. I do not think that such conditions favour any noticeable increase in the mistakes. We are accustomed to assume concerning a whole series of functions that they are most precisely performed when done automatically, with scarcely any conscious attention. This argues that the conditions governing attention in mistakes in speaking, writing, and reading must be differently determined than assumed by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have really not given us the right to take for granted a quantitative diminution of attention. We found what is probably not exactly the same thing, a disturbance of the attention through a strange obtruding thought.

ENDNOTES.

VII. Forgetting of Impressions and Resolutions

IF any one should be inclined to overrate the state of our present knowledge of mental life, all that would be needed to force him to assume a modest attitude would be to remind him of the function of memory. No psychologic theory has yet been able to account for the connection between the fundamental phenomena of remembering and forgetting; indeed, even the complete analysis of that which one can actually observe has as yet scarcely been grasped. To-day forgetting has perhaps grown more puzzling than remembering, especially since we have learned from the study of dreams and pathologic states that even what for a long time we believed forgotten may suddenly return to consciousness.

To be sure, we are in possession of some view-points which we hope will receive general recognition. Thus we assume that forgetting is a spontaneous process to which we may ascribe a certain temporal discharge. We emphasize the fact that, just as among the units of every impression or experience, in forgetting, too, a certain selection takes place among the existing impressions. We are acquainted with some of the conditions that underlie the tenaciousness of memory and the awakening of that which would otherwise remain forgotten. Nevertheless, we can observe in innumerable cases of daily life how unreliable and unsatisfactory our knowledge of the mechanism is. Thus we may listen to two persons exchanging reminiscences concerning the same outward impressions, say of a journey that they have taken together some time before. What remains most firmly in the memory of the one is often forgotten by the other, as if it had never occurred, even when there is not the slightest reason to assume that this impression is of greater psychic importance for the one than for the other. A great many of those factors which determine the selective power of memory are obviously still beyond our ken.

With the purpose of adding some small contribution to the knowledge of the conditions of forgetting, I was wont to subject to a psychologic analysis those cases in which forgetting concerned me personally. As a rule I took up only a certain group of those cases, namely, those in which the forgetting astonished me, because, in my opinion, I should have remembered the experience in question. I wish further to remark that I am generally not inclined to forgetfulness (of things experienced, not of things

learned), and that for a short period of my youth I was able to perform extraordinary feats of memory. When I was a schoolboy it was quite natural for me to be able to repeat from memory the page of a book which I had read; and shortly before I entered the University I could write down practically verbatim the popular lectures on scientific subjects directly after hearing them. In the tension before the final medical examination I must have made use of the remnant of this ability, for in certain subjects I gave the examiners apparently automatic answers, which proved to be exact reproductions of the text-book, which I had skimmed through but once and then in greatest haste.

Since those days I have steadily lost control over my memory; of late, however, I became convinced that with the aid of a certain artifice I can recall far more than I would otherwise credit myself with remembering. For example, when, during my office hours, a patient states that I have seen him before and I cannot recall either the fact or the time, then I help myself by guessing — that is, I allow a number of years, beginning from the present time, to come to my mind quickly. Whenever this could be controlled by records of definite information from the patient, it was always shown that in over ten years [1] I have seldom missed it by more than six months. The same thing happens when I meet a casual acquaintance and, from politeness, inquire about his small child. When he tells of its progress I try to fancy how old the child now is. I control my estimate by the information given by the father, and at most I make a mistake of a month, and in older children of three months. I cannot state, however, what basis I have for this estimate. Of late I have grown so bold that I always offer my estimate spontaneously, and still run no risk of grieving the father by displaying my ignorance in regard to his offspring. Thus I extend my conscious memory by invoking my larger unconscious memory.

I shall report some *striking* examples of forgetting which for the most part I have observed in myself. I distinguish forgetting of impressions and experiences, that is, the forgetting of knowledge, from forgetting of resolutions, that is, the forgetting of omissions. The uniform result of the entire series of observations I can formulate as follows: *The forgetting in all cases is proved to be founded on a motive of displeasure.*

A. Forgetting of Impressions and Knowledge.

(*a*) During the summer my wife once made me very angry, although the cause in itself was trifling. We sat in a restaurant opposite a gentleman from Vienna whom I knew, and who had cause to know me, and whose acquaintance I had reasons for not wishing to renew. My wife, who had heard nothing to the disrepute of the man opposite her, showed by her actions that she was listening to his conversation with his neighbours, for from time to time she asked me questions which took up the thread of their discussion. I became impatient and finally irritated. A few weeks later I complained to a relative about this behaviour on the part of my wife, but I was not able to recall even a single word of the conversation of the gentleman in the case. As I am usually rather resentful and cannot forget a single incident of an episode that has annoyed me, my amnesia in this case was undoubtedly determined by respect for my wife.

A short time ago I had a similar experience. I wished to make merry with an intimate friend over a statement made by my wife only a few hours earlier, but I found myself hindered by the noteworthy fact that I had entirely forgotten the statement. I had first to beg my wife to recall it to me. It is easy to understand that my forgetting in this case may be analogous to the typical disturbance of judgment which dominates us when it concerns those nearest to us.

(*b*) To oblige a woman who was a stranger in Vienna I had undertaken to procure a small iron safe for the preservation of documents and money. When I offered my services, the image of an establishment in the heart of the city where I was sure I had seen such safes floated before me with extraordinary visual vividness. To be sure, I could not recall the name of the street, but I felt certain that I would discover the store in a walk through the city, for my memory told me that I had passed it countless times. To my chagrin I could not find this establishment with the safes, though I walked through the inner part of the city in every direction. I concluded that the only thing left to do was to search through a business directory, and if that failed, to try to identify the establishment in a second round of the city. It did not, however, require so much effort; among the addresses in the directory I found one which immediately presented itself as that which had been forgotten. It was true that I had passed the show window countless times, each time, however, when I had gone to visit the M. family, who have lived a great many years in this identical building. After this intimate friendship had turned to an absolute estrangement, I

had taken care to avoid the neighbourhood as well as the house, though without ever thinking of the reason for my action. In my walk through the city searching for the safe in the show window I had traversed every street in the neighbourhood but the right one, and I had avoided this as if it were forbidden ground.

The motive of displeasure which was at the bottom of my disorientation is thus comprehensible. But the mechanism of forgetting is no longer so simple as in the former example. Here my aversion naturally does not extend to the vendor of safes, but to another person, concerning whom I wish to know nothing, and later transfers itself from the latter to this incident where it brings about the forgetting. Similarly, in the case of *Burckhard* mentioned above, the grudge against the one brought about the error in writing the name of the other. The similarity of names which here established a connection between two essentially different streams of thought was accomplished in the showcase window instance by the contiguity of space and the inseparable environment. Moreover, this latter case was more closely knit together, for money played a great part in the causation of the estrangement from the family living in this house.

(*c*) The B. and R. Company requested me to pay a professional call on one of their officers. On my way to him I was engrossed in the thought that I must already have been in the building occupied by the firm. It seemed as if I used to see their signboard in a lower story while my professional visit was taking me to a higher story. I could not recall, however, which house it was nor when I had called there. Although the entire matter was indifferent and of no consequence, I nevertheless occupied myself with it, and at last learned in the usual roundabout way, by collecting the thoughts that occurred to me in this connection, that one story above the floor occupied by the firm B. and R. was the *Pension Fischer,* where I had frequently visited patients. Then I remembered the building which sheltered both the company and the *pension.*

I was still puzzled, however, as to the motive that entered into play in this forgetting. I found nothing disagreeable in my memory concerning the firm itself or the *Pension Fischer,* or the patients living there. I was also aware that it could not deal with anything very painful, otherwise I hardly would have been successful in tracing the thing forgotten in a roundabout way without resorting to external aid, as happened in the preceding example. Finally it occurred to me that a little before, while starting on my

way to a new patient, a gentleman whom I had difficulty in recalling greeted me in the street. Some months previously I had seen this man in an apparently serious condition and had made the diagnosis of general paresis, but later I had learned of his recovery, consequently my judgment had been incorrect. Was it not possible that we had in this case a remission, which one usually finds in *dementia paralytica?* In that contingency my diagnosis would still be justified. The influence emanating from this meeting caused me to forget the neighbourhood of the B. and R. Company, and my interest to discover the thing forgotten was transferred from this case of disputed diagnosis. But the associative connection in this loose inner relation was effected by means of a similarity of names: the man who recovered, contrary to expectation, was also an officer of a large company that recommends patients to me. And the physician with whom I had seen the supposed paretic bore the name of Fischer, the name of the *pension* in the house which I had forgotten.

(*d*) Mislaying a thing really has the same significance as forgetting where we have placed it. Like most people delving in pamphlets and books, I am well oriented about my desk, and can produce what I want with one lunge. What appears to others as disorder has become for me perfect order. Why, then, did I mislay a catalogue which was sent to me not long ago so that it could not be found? What is more, it had been my intention to order a book which I found announced therein, entitled *Ueber die Sprache,* because it was written by an author whose spirited, vivacious style I like, whose insight into psychology and whose knowledge of the cultural world I have learned to appreciate. I believe that was just why I mislaid the catalogue. It was my habit to lend the books of this author among my friends for their enlightenment, and a few days before, on returning one, somebody had said: “His style reminds me altogether of yours, and his way of thinking is identical.” The speaker did not know what he was stirring up with this remark. Years ago, when I was younger and in greater need of forming alliances, I was told practically the same thing by an older colleague, to whom I had recommended the writings of a familiar medical author. To put it in his words, “It is absolutely your style and manner.” I was so influenced by these remarks that I wrote a letter to this author with the object of bringing about a closer relation, but a rather cool answer put me back “in my place.” Perhaps still earlier discouraging experiences conceal themselves behind this last one, for I did not find the

mislaid catalogue. Through this premonition I was actually prevented from ordering the advertised book, although the disappearance of the catalogue formed no real hindrance, as I remembered well both the name of the book and the author.

(*e*) Another case of mislaying merits our interest on account of the conditions under which the mislaid object was rediscovered. A younger man narrates as follows: "Several years ago there were some misunderstandings between me and my wife. I found her too cold, and though I fully appreciated her excellent qualities, we lived together without evincing any tenderness for each other. One day on her return from a walk she gave me a book which she had bought because she thought it would interest me. I thanked her for this mark of 'attention,' promised to read the book, put it away, and did not find it again. So months passed, during which I occasionally remembered the lost book, and also tried in vain to find it.

"About six months later my beloved mother, who was not living with us, became ill. My wife left home to nurse her mother-in-law. The patient's condition became serious and gave my wife the opportunity to show the best side of herself. One evening I returned home full of enthusiasm over what my wife had accomplished, and felt very grateful to her. I stepped to my desk and, without definite intention but with the certainty of a somnambulist, I opened a certain drawer, and in the very top of it I found the long-missing, mislaid book."

The following example of "misplacing" belongs to a type well known to every psychoanalyst. I must add that the patient who experienced this misplacing has himself found the solution of it.

This patient, whose psychoanalytic treatment had to be interrupted through the summer vacation when he was in a state of resistance and ill-health, put away his keys in the evening in their usual place, or so he thought. He then remembered that he wished to take some things from his desk, where he also had put the money which he needed on the journey. He was to depart the next day, which was the last day of treatment and the date when the doctor's fee was due. But the keys had disappeared.

He began a thorough and systematic search through his small apartment. He became more and more excited over it, but his search was unsuccessful. As he recognized this "misplacement" as a symptomatic act — that is, as being intentional — he aroused his servant in order to

continue his search with the help of an “unprejudiced” person. After another hour he gave up the search and feared that he had lost the keys. The next morning he ordered new keys from the desk factory, which were hurriedly made for him. Two acquaintances who had been with him in a cab even recalled hearing something fall to the ground as he stepped out of the cab, and he was therefore convinced that the keys had slipped from his pocket. They were found lying between a thick book and a thin pamphlet, the latter a work of one of my pupils, which he wished to take along as reading matter for his vacation; and they were so skilfully placed that no one would have supposed that they were there. He himself was unable to replace the keys in such a position as to render them invisible. The unconscious skill with which an object is misplaced on account of secret but strong motives reminds one of “somnambulistic sureness.” The motive was naturally ill-humour over the interruption of the treatment and the secret rage over the fact that he had to pay such a high fee when he felt so ill.

(*g*) Brill relates: [2] “A man was urged by his wife to attend a social function in which he really took no interest. Yielding to his wife’s entreaties, he began to take his dress-suit from the trunk when he suddenly thought of shaving. After accomplishing this he returned to the trunk and found it locked. Despite a long, earnest search the key could not be found. A locksmith could not be found on Sunday evening, so that the couple had to send their regrets. On having the trunk opened the next morning the lost key was found within. The husband had absentmindedly dropped the key into the trunk and sprung the lock. He assured me that this was wholly unintentional and unconscious, but we know that he did not wish to go to this social affair. The mislaying of the key therefore lacked no motive.”

Ernest Jones noticed in himself that he was in the habit of mislaying his pipe whenever he suffered from the effects of over-smoking. The pipe was then found in some unusual place where it did not belong and which it normally did not occupy.

If one looks over the cases of mislaying it will be difficult to assume that mislaying is anything other than the result of an unconscious intention.

(*h*) In the summer of 1901 I once remarked to a friend with whom I was then actively engaged in exchanging ideas on scientific questions: “These neurotic problems can be solved only if we take the position of absolutely

accepting an original bi-sexuality in every individual." To which he replied: "I told you that two and a half years ago while we were taking an evening walk in Br. At that time you wouldn't listen to it."

It is truly painful to be thus requested to renounce one's originality. I could neither recall such a conversation nor my friend's revelation. One of us must be mistaken; and according to the principle of the question *cui prodest?* I must be the one. Indeed, in the course of the following weeks everything came back to me just as my friend had recalled it. I myself remembered that at that time I gave the answer: "I have not yet got so far, and I do not care to discuss it." But since this incident I have grown more tolerant when I miss any mention of my name in medical literature in connection with ideas for which I deserve credit.

It is scarcely accidental that the numerous examples of forgetting which have been collected without any selection should require for their solution the introduction of such painful themes as exposing of one's wife; a friendship that has turned into the opposite; a mistake in medical diagnosis; enmity on account of similar pursuits, or the borrowing of somebody's ideas. I am rather inclined to believe that every person who will undertake an inquiry into the motives underlying his forgetting will be able to fill up a similar sample card of vexatious circumstances. The tendency to forget the disagreeable seems to me to be quite general; the capacity for it is naturally differently developed in different persons. Certain *denials* which we encounter in medical practice can probably be ascribed to *forgetting.* [3] Our conception of such forgetting confines the distinction between this and that behaviour to purely psychologic relations, and permits us to see in both forms of reaction the expression of the same motive. Of the numerous examples of denials of unpleasant recollection which I have observed in kinsmen of patients, one remains in my memory as especially singular.

A mother telling me of the childhood of her nervous son, now in his puberty, made the statement that, like his brothers and sisters, he was subject to bed-wetting throughout his childhood, a symptom which certainly has some significance in a history of a neurotic patient. Some weeks later, while seeking information regarding the treatment, I had occasion to call her attention to signs of a constitutional morbid predisposition in the young man, and at the same time referred to the bed-wetting recounted in the anamnesis. To my surprise she contested this fact

concerning him, denying it as well for the other children, and asked me how I could possibly know this. Finally I let her know that she herself had told me a short time before what she had thus forgotten. [4]

One also finds abundant indications which show that even in healthy, not neurotic, persons resistances are found against the memory of disagreeable impressions and the idea of painful thoughts. [5] But the full significance of this fact can be estimated only when we enter into the psychology of neurotic persons. One is forced to make such elementary defensive striving against ideas which can awaken painful feelings, a striving which can be put side by side only with the flight-reflex in painful stimuli, as the main pillar of the mechanism which carries the hysterical symptoms. One need not offer any objection to the acceptance of such defensive tendency on the ground that we frequently find it impossible to rid ourselves of painful memories which cling to us, or to banish such painful emotions as remorse and reproaches of conscience. No one maintains that this defensive tendency invariably gains the upper hand, that in the play of psychic forces it may not strike against factors which stir up the contrary feeling for other purposes and bring it about in spite of it.

As the architectural principle of the psychic apparatus we may conjecture a certain stratification or structure of instances deposited in strata. And it is quite possible that this defensive tendency belongs to a lower psychic instance, and is inhibited by higher instances. At all events, it speaks for the existence and force of this defensive tendency, when we can trace it to processes such as those found in our examples of forgetting. We see then that something is forgotten for its own sake, and where this is not possible the defensive tendency misses the target and causes something else to be forgotten — something less significant, but which has fallen into associative connection with the disagreeable material.

The views here developed, namely, that painful memories merge into motivated forgetting with special ease, merits application in many spheres where as yet it has found no, or scarcely any, recognition. Thus it seems to me that it has not yet been strongly enough emphasized in the estimation of testimony taken in court, [6] where the putting of a witness under oath obviously leads us to place too great a trust on the purifying influence of his psychic play of forces. It is universally admitted that in the origin of the traditions and folklore of a people care must be taken to eliminate

from memory such a motive as would be painful to the national feeling. Perhaps on closer investigation it may be possible to form a perfect analogy between the manner of development of national traditions and infantile reminiscences of the individual. The great Darwin has formulated a “golden rule” for the scientific worker from his insight into this pain-motive of forgetting. [7]

Almost exactly as in the forgetting of names, faulty recollections can also appear in the forgetting of impressions, and when finding credence they may be designated as delusions of memory. The memory disturbance in pathologic cases (in paranoia it actually plays the rôle of a constituting factor in the formation of delusions) has brought to light an extensive literature in which there is no reference whatever to its being motivated. As this theme also belongs to the psychology of the neuroses it goes beyond our present treatment. Instead, I will give from my own experience a curious example of memory disturbance showing clearly enough its determination through unconscious repressed material and its connection with this material.

While writing the latter chapters of my volume on the interpretation of dreams, I happened to be in a summer resort without access to libraries and reference books, so that I was compelled to introduce into the manuscript all kinds of references and citations from memory. These I naturally reserved for future correction. In the chapter on day-dreams I thought of the distinguished figure of the poor book-keeper in Alphonse Daudet’s *Nabab*, through whom the author probably described his own day-dreams. I imagined that I distinctly remembered one fantasy of this man, whom I called Mr. Jocelyn, which he hatched while walking the streets of Paris, and I began to reproduce it from memory. This fantasy described how Mr. Jocelyn boldly hurled himself at a runaway horse and brought it to a standstill; how the carriage door opened and a great personage stepped from the coupé, pressed Mr. Jocelyn’s hand and said: “You are my saviour — I owe my life to you! What can I do for you?”

I assured myself that casual inaccuracies in the rendition of this fantasy could readily be corrected at home on consulting the book. But when I perused *Nabab* in order to compare it with my manuscript, I found to my very great shame and consternation that there was nothing to suggest such a dream by Mr. Jocelyn; indeed, the poor book-keeper did not even bear this name — he was called Mr. Joyeuse.

This second error then furnished the key for the solution of the first mistake, the faulty reminiscence. Joyeux, of which Joyeuse is the feminine form, was the only possible word which would translate my own name *Freud* into French. Whence, therefore, came this falsely remembered fantasy which I had attributed to Daudet? It could only be a product of my own, a day-dream which I myself had spun, and which did not become conscious, or which was once conscious and had since been absolutely forgotten. Perhaps I invented it myself in Paris, where frequently enough I walked the streets alone, and full of longing for a helper and protector, until Charcot took me into his circle. I had often met the author of *Nabab* in Charcot's house. But the provoking part of it all is the fact that there is scarcely anything to which I am so hostile as the thought of being some one's protégé. What we see of this sort of thing in our country spoils all desire for it, and my character is little suited to the rôle of a protected child. I have always entertained an immense desire to "be the strong man myself." And it had to happen that I should be reminded of such a, to be sure, never fulfilled, day-dream! Besides, this incident is a good example of how the restraint relation to one's ego, which breaks forth triumphantly in paranoia, disturbs and entangles us in the objective grasp of things.

Another case of faulty recollection which can be satisfactorily explained resembles the *fausse reconnaissance* to be discussed later. I related to one of my patients, an ambitious and very capable man, that a young student had recently gained admittance into the circle of my pupils by means of an interesting work, *Der Künstler, Versuch einer Sexualpsychologie.* When, a year and a quarter later, this work lay before me in print, my patient maintained that he remembered with certainty having read somewhere, perhaps in a bookseller's advertisement, the announcement of the same book even before I first mentioned it to him. He remembered that this announcement came to his mind at that time, and he ascertained besides that the author had changed the title, that it no longer read *"Versuch"* but *"Ansätze zu einer Sexualpsychologie."*

Careful inquiry of the author and comparison of all dates showed conclusively that my patient was trying to recall the impossible. No notice of this work had appeared anywhere before its publication, certainly not a year and a quarter before it went to print. However, I neglected to seek a solution for this false recollection until the same man brought about an equally valuable renewal of it. He thought that he had recently noticed a

work on “agoraphobia” in the show window of a bookshop, and as he was now looking for it in all available catalogues I was able to explain to him why his effort must remain fruitless. The work on agoraphobia existed only in his fantasy as an unconscious resolution to write such a book himself. His ambition to emulate that young man, and through such a scientific work to become one of my pupils, had led him to the first as well as to the second false recollection. He also recalled later that the bookseller’s announcement which had occasioned his false reminiscence dealt with a work entitled *Genesis, Das Gesetz der Zeugung* (“Genesis, The Law of Generation”). But the change in the title as mentioned by him was really instigated by me; I recalled that I myself have perpetrated the same inaccuracy in the repetition of the title by saying *“Ansätze”* in place of *“Versuch.”*

B. Forgetting of Intentions.

No other group of phenomena is better qualified to demonstrate the thesis that lack of attention does not in itself suffice to explain faulty acts as the forgetting of intentions. An intention is an impulse for an action which has already found approbation, but whose execution is postponed for a suitable occasion. Now, in the interval thus created sufficient change may take place in the motive to prevent the intention from coming to execution. It is not, however, forgotten, it is simply revised and omitted.

We are naturally not in the habit of explaining the forgetting of intentions which we daily experience in every possible situation as being due to a recent change in the adjustment of motives. We generally leave it unexplained, or we seek a psychologic explanation in the assumption that at the time of execution the required attention for the action, which was an indispensable condition for the occurrence of the intention, and was then at the disposal of the same action, no longer exists. Observation of our normal behaviour towards intentions urges us to reject this tentative explanation as arbitrary. If I resolve in the morning to carry out a certain intention in the evening, I may be reminded of it several times in the course of the day, but it is not at all necessary that it should become conscious throughout the day. As the time for its execution approaches it suddenly occurs to me and induces me to make the necessary preparation for the intended action. If I go walking and take a letter with me to be posted, it is not at all necessary that I, as a normal not nervous individual,

should carry it in my hand and continually look for a letter-box. As a matter of fact I am accustomed to put it in my pocket and give my thoughts free rein on my way, feeling confident that the first letter-box will attract my attention and cause me to put my hand in my pocket and draw out the letter.

This normal behaviour in a formed intention corresponds perfectly with the experimentally produced conduct of persons who are under a so-called "post-hypnotic suggestion" to perform something after a certain time. [8] We are accustomed to describe the phenomenon in the following manner: the suggested intention slumbers in the person concerned until the time for its execution approaches. Then it awakes and excites the action.

In two positions of life even the layman is cognizant of the fact that forgetting referring to intended purposes can in no wise claim consideration as an elementary phenomenon no further reducible, but realizes that it ultimately depends on unadmitted motives. I refer to affairs of love and military service. A lover who is late at the appointed place will vainly tell his sweetheart that unfortunately he has entirely forgotten their rendezvous. She will not hesitate to answer him: "A year ago you would not have forgotten. Evidently you no longer care for me." Even if he should grasp the above-cited psychologic explanation, and should wish to excuse his forgetting on the plea of important business, he would only elicit the answer from the woman, who has become as keen-sighted as the physician in the psychoanalytic treatment, "How remarkable that such business disturbances did not occur before!" Of course the woman does not wish to deny the possibility of forgetting; but she believes, and not without reason, that practically the same inference of a certain unwillingness may be drawn from the unintentional forgetting as from a conscious subterfuge.

Similarly, in military service no distinction is recognized between an omission resulting from forgetting and one in consequence of intentional neglect. And rightly so. The soldier dares forget nothing that military service demands of him. If he forgets in spite of this, even when he is acquainted with the demands, then it is due to the fact that the motives which urge the fulfilment of the military exactions are opposed by contrary motives. Thus the one year's volunteer [9] who at inspection pleads forgetting as an excuse for not having polished his buttons is sure to be punished. But this punishment is small in comparison to the one he courts

if he admits to his superiors that the motive for his negligence is because “this miserable menial service is altogether disgusting to me.” Owing to this saving of punishment for economic reasons, as it were, he makes use of forgetting as an excuse, or it comes about as a compromise.

The service of women (as well as the military service of the State) demands that nothing relating to that service be subject to forgetting. Thus it but suggests that forgetting is permissible in unimportant matters, but in weighty matters its occurrence is an indication that one wishes to treat weighty matters as unimportant: that is, that their importance is disputed. [10] The view-point of psychic validity is in fact not to be contested here. No person forgets to carry out actions that seem important to himself without exposing himself to the suspicion of being a sufferer from mental weakness. Our investigations therefore can extend only to the forgetting of more or less secondary intentions, for no intention do we deem absolutely indifferent, otherwise it would certainly never have been formed.

As in the preceding functional disturbances, I have collected the cases of neglect through forgetting which I have observed in myself, and endeavoured to explain them. I have found that they could invariably be traced to some interference of unknown and unadmitted motives — or, as may be said, they were due to a counter-will. In a number of these cases I found myself in a position similar to that of being in some distasteful service: I was under a constraint to which I had not entirely resigned myself, so that I showed my protest in the form of forgetting. This accounts for the fact that I am particularly prone to forget to send congratulations on such occasions as birthdays, jubilees, wedding celebrations, and promotions to higher rank. I continually make new resolutions, but I am more than ever convinced that I shall not succeed. I am now on the point of giving it up altogether, and to admit consciously the striving motives. In a period of transition, I told a friend who asked me to send a congratulatory telegram for him, at a certain time when I was to send one myself, that I would probably forget both. It was not surprising that the prophecy came true. It is undoubtedly due to painful experiences in life that I am unable to manifest sympathy where this manifestation must necessarily appear exaggerated, for the small amount of my feeling does not admit the corresponding expression. Since I have learned that I often mistook the pretended sympathy of others for real, I am in rebellion against the conventions of expressing sympathy, the social expediency of

which I naturally acknowledge. Condolences in cases of death are excepted from this double treatment; once I determine to send them I do not neglect them. Where my emotional participation has nothing more to do with social duty, its expression is never inhibited by forgetting.

Cases in which we forget to carry out actions which we have promised to do as a favour for others can similarly be explained as antagonism to conventional duty and as an unfavourable inward opinion. Here it regularly proves correct, inasmuch as the only person appealed to believes in the excusing power of forgetfulness, while the one requesting the favour has no doubt about the right answer: he has no interest in this matter, otherwise he would not have forgotten it.

There are some who are noted as generally forgetful, and we excuse their lapses in the same manner as we excuse those who are short-sighted when they do not greet us in the street. [11] Such persons forget all small promises which they have made; they leave unexecuted all orders which they have received; they prove themselves unreliable in little things; and at the same time demand that we shall not take these slight offences amiss — that is, they do not want us to attribute these failings to personal characteristics but to refer them to an organic peculiarity. [12] I am not one of these people myself, and have had no opportunity to analyse the actions of such a person in order to discover from the selection of forgetting the motive underlying the same. I cannot forego, however, the conjecture *per analogiam*, that here the motive is an unusual large amount of unavowed disregard for others which exploits the constitutional factor for its purpose. [13]

In other cases the motives for forgetting are less easy to discover, and when found excite greater astonishment. Thus, in former years I observed that of a great number of professional calls I only forgot those that I was to make on patients whom I treated gratis or on colleagues. The mortification caused by this discovery led me to the habit of noting every morning the calls of the day in a form of resolution. I do not know if other physicians have come to the same practice by a similar road. Thus we get an idea of what causes the so-called neurasthenic to make a memorandum of the communications he wishes to make to the doctor. He apparently lacks confidence in the reproductive capacity of his memory. This is true, but the scene usually proceeds in this manner. The patient has recounted his various complaints and inquiries at considerable length. After he has

finished he pauses for a moment, then he pulls out the memorandum and says apologetically, “I have made some notes because I cannot remember anything.” As a rule he finds nothing new on the memorandum. He repeats each point and answers it himself: “Yes, I have already asked about that.” By means of the memorandum he probably only demonstrates one of his symptoms, the frequency with which his resolutions are disturbed through the interference of obscure motives.

I am touching, moreover, on an affliction to which even most of my healthy acquaintances are subject, when I admit that especially in former years I had the habit of easily forgetting for a long time to return borrowed books, also that it very often happened that I deferred payments through forgetfulness. One morning not long ago I left the tobacco-shop where I make my daily purchase of cigars without paying. It was a most harmless omission, as I am known there and could therefore expect to be reminded of my debt the next morning. But this slight neglect, the attempt to contract a debt, was surely not unconnected with reflections concerning the budget with which I had occupied myself throughout the preceding day. Even among the so-called respectable people one can readily demonstrate a double behaviour when it concerns the theme of money and possession. The primitive greed of the suckling which wishes to seize every object (in order to put it in its mouth) has generally been only imperfectly subdued through culture and training. [14]

I fear that in all the examples thus far given I have grown quite commonplace. But it can be only a pleasure to me if I happen upon familiar matters which every one understands, for my main object is to collect everyday material and utilize it scientifically. I cannot conceive why wisdom, which is, so to speak, the sediment of everyday experiences, should be denied admission among the acquisitions of knowledge. For it is not the diversity of objects but the stricter method of verification and the striving for far-reaching connections which make up the essential character of scientific work.

We have invariably found that intentions of some importance are forgotten when obscure motives arise to disturb them. In still less important intentions we find a second mechanism of forgetting. Here a counter-will becomes transferred to the resolution from something else after an external association has been formed between the latter and the content of the resolution. The following example reported by Brill

illustrates this: “A patient found that she had suddenly became very negligent in her correspondence. She was naturally punctual and took pleasure in letter-writing, but for the last few weeks she simply could not bring herself to write a letter without exerting the greatest amount of effort. The explanation was quite simple. Some weeks before she had received an important letter calling for a categorical answer. She was undecided what to say, and therefore did not answer it at all. This indecision in the form of inhibition was unconsciously transferred to other letters and caused the inhibition against letter-writing in general.”

Direct counter-will and more remote motivation are found together in the following example of delaying: I had written a short treatise on the dream for the series *Grenzfragen des Nerven- und Seelenlebens,* in which I gave an abstract of my book, *The Interpretation of Dreams.* [15] Bergmann, the publisher, had sent me the proof sheets and asked for a speedy return of the same as he wished to issue the pamphlet before Christmas. I corrected the sheets the same night, and placed them on my desk in order to take them to the post office the next morning. In the morning I forgot all about it, and only thought of it in the afternoon at the sight of the paper cover on my desk. In the same way I forgot the proofs that evening and the following morning, and until the afternoon of the second day, when I quickly took them to a letter-box, wondering what might be the basis of this procrastination. Obviously I did not want to send them off, although I could find no explanation for such an attitude.

After posting the letter I entered the shop of my Vienna publisher, who put out my *Interpretation of Dreams.* I left a few orders; then, as if impelled by a sudden thought, said, “You undoubtedly know that I have written the ‘Dream’ book a second time?” “Ah!” he exclaimed, “then I must ask you to — —” “Calm yourself,” I interposed; “it is only a short treatise for the Löwenfeld-Kurella collection.” But still he was not satisfied; he feared that the abstract would hurt the sale of the book. I disagreed with him, and finally asked: “If I had come to you before, would you have objected to the publication?” “No; under no circumstances,” he answered.

Personally I believe I acted within my full rights and did nothing contrary to the general practice; still it seems certain to me that a thought similar to that entertained by the publisher was the motive for my procrastination in dispatching the proof sheets.

This reflection leads back to a former occasion when another publisher raised some difficulties because I was obliged to take out several pages of the text from an earlier work on cerebral infantile paralysis, and put them unchanged into a work on the same theme in Nothnagel's handbook. There again the reproach received no recognition; that time also I had loyally informed my first publisher (the same who published *The Interpretation of Dreams*) of my intention.

However, if this series of recollections is followed back still farther it brings to light a still earlier occasion relating to a translation from the French, in which I really violated the property rights that should be considered in a publication. I had added notes to the text without asking the author's permission, and some years later I had cause to think that the author was dissatisfied with this arbitrary action.

There is a proverb which indicates the popular knowledge that the forgetting of intentions is not accidental. It says: "What one forgets once he will often forget again."

Indeed, we sometimes cannot help feeling that no matter what may be said about forgetting and faulty actions, the whole subject is already known to everybody as something self-evident. It is strange enough that it is still necessary to push before consciousness such well-known facts. How often I have heard people remark: "Please do not ask me to do this, I shall surely forget it." The coming true of this prophecy later is surely nothing mysterious in itself. He who speaks thus perceives the inner resolution not to carry out the request, and only hesitates to acknowledge it to himself.

Much light is thrown, moreover, on the forgetting of resolutions through something which could be designated as "forming false resolutions." I had once promised a young author to write a review of his short work, but on account of inner resistances, not unknown to me, I promised him that it would be done the same evening. I really had serious intentions of doing so, but I had forgotten that I had set aside that evening for the preparation of an expert testimony that could not be deferred. After I thus recognized my resolution as false, I gave up the struggle against my resistances and refused the author's request.

ENDNOTES.

[1] In the course of the conference the details of the previous first visit return to consciousness.

[2] Brill, *loc. cit.*, p. 197.

[3] If we inquire of a person whether he suffered from luetic infection ten or fifteen years ago, we are only too apt to forget that psychically the patient has looked upon this disease in an entirely different manner than on, let us say, an acute attack of rheumatism. In the anamneses which parents give about their neurotic daughters, it is hardly possible to distinguish with any degree of certainty the portion forgotten from that hidden, for anything that stands in the way of the girl's future marriage is systematically set aside by the parents, that is, it becomes repressed. A man who had recently lost his beloved wife from an affection of the lungs reported to me the following case of misleading the doctor, which can only be explained by the theory of such forgetting. "As my poor wife's pleuritis had not disappeared after many weeks, Dr. P. was called in consultation. While taking the history he asked among others the customary questions whether there were any cases of lung trouble in my wife's family. My wife denied any such cases, and even I myself could not remember any. While Dr. P. was taking leave the conversation accidentally turned to excursions, and my wife said: 'Yes, even to Landgersdorf, where my poor brother lies buried, is a long journey.' This brother died about fifteen years ago, after having suffered for years from tuberculosis. My wife was very fond of him, and often spoke about him. Indeed, I recall that when her malady was diagnosed as pleurisy she was very worried and sadly remarked: 'My brother also died of lung trouble.' But the memory was so very repressed that even after the above-cited conversation about the trip to L. she found no occasion to correct her information concerning the diseases in her family. I myself was struck by this forgetting at the very moment she began to talk about Landgersdorf." A perfectly analogous experience is related by Ernest Jones in his work. A physician whose wife suffered from some obscure abdominal malady remarked to her: "It is comforting to think that there has been no tuberculosis in your family." She turned to him very astonished and said, "Have you forgotten that my mother died of tuberculosis, and that my sister recovered from it only after having been given up by the doctors?"

[4] During the days when I was first writing these pages the following almost incredible case of forgetting happened to me. On the 1st of January I examined my notes so that I could send out my bills. In the month of June I came across the name M —— l, and could not recall the person to whom it belonged. My surprise increased when I observed from my books that I treated the case in a sanatorium, and that for weeks I had called on the patient daily. A patient treated under such conditions is rarely forgotten by a physician in six months. I asked myself if it could have been a man — a paretic — a case without interest? Finally, the note about the fee received brought to my memory all the knowledge which strove to elude it. M —— l was a fourteen-year-old girl, the most remarkable case of my latter years, a case which taught me a lesson I am not likely ever to forget, a case whose upshot gave me many painful hours. The child became afflicted with an unmistakable hysteria, which quickly and thoroughly improved under my care. After this improvement the child was taken away from me by the parents. She still complained of abdominal pains which had played the part in the hysterical symptoms. Two months later she died of sarcoma of the abdominal glands. The hysteria, to which she was greatly predisposed, took the tumour-formation as a provocative agent, and I, fascinated by the tumultuous but harmless manifestations of hysteria, perhaps overlooked the first sign of the insidious and incurable disease.

[5] A. Pick ("Zur Psychologie des Vergessens bei Geistesund Nervenkranken," *Archiv. f. Kriminal-Anthropologie u. Kriminalistik,* von H. Gross) has recently collected a number of authors who realize the value of the influence of the affective factors on memory, and who more or less clearly recognize that a defensive striving against pain can lead to forgetting. But none of us has been able to represent this phenomenon and its psychologic determination as exhaustively, and at the same time as effectively, as Nietzsche in one of his aphorisms (*Jenseits von Gut und Bosen,* ii., *Haupstuck* 68): "'I have done that,' says my Memory. 'I could not have done that,' says my Pride, and remains inexorable. Finally, my Memory yields."

[6] Cf. Hans Gross, *Kriminal Psychologie,* 1898.

[7] Darwin on forgetting. In Darwin's autobiography one finds the following passage that does equal credit to his scientific honesty and his psychologic acumen: "I had during many years followed a golden rule, namely, that whenever a published fact, a new observation or thought, came across me which was opposed to my general results, to make a memorandum of it without fail and at once; for I had found by experience that such facts and thoughts were far more apt to escape from the memory than favourable ones" (quoted by Jones, *loc. cit.,* p. 38).

[8] Cf. Bernheim, *Neue Studien über Hypnotismus, Suggestion und Psychotherapie,* 1892.

[9] Young men of education who can pass the examination and pay for their maintenance serve one instead of two years' compulsory service.

[10] In Bernard Shaw's *Cæsar and Cleopatra,* Cæsar's indifference to Cleopatra is depicted by his being vexed on leaving Egypt at having forgotten to do something. He finally recollected what he had forgotten — to take leave of Cleopatra — this, to be sure, is in full accord with historical truth. How little Cæsar thought of the little Egyptian princess! Cited from Jones, *loc. cit.,* p. 50.

[11] Women, with their fine understanding of unconscious mental processes, are, as a rule, more apt to take offence when we do not recognize them in the street, and hence do not greet them, than to accept the most obvious explanation, namely, that the dilatory one is short-sighted or so engrossed in thought that he did not see them. They conclude that they surely would have been noticed if they had been considered of any consequence.

[12] Dr. Ferenczi reports that he was a distracted person himself, and was considered peculiar by his friends on account of the frequency and strangeness of his failing. But the signs of this inattention have almost all disappeared since he began to practise psychoanalysis with patients, and was forced to turn his attention to the analysis of his own ego. He believes that one renounces these failings when one learns to extend by so much one's own responsibilities. He therefore justly maintains that distractedness is a state which depends on unconscious complexes, and is curable by psychoanalysis. One day he was reproaching himself for having committed a technical error in the psychoanalysis of a patient, and on this day all his former distractions reappeared. He stumbled while walking in the street (a representation of that *faux pas* in the treatment), he forgot his pocket-book at home, he was a penny short in his car fare, he did not properly button his clothes, etc.

[13] E. Jones remarks regarding this: “Often the resistance is of a general order. Thus a busy man forgets to mail a letter entrusted to him — to his slight annoyance — by his wife, just as he may ‘forget’ to carry out her shopping orders.

[14] For the sake of the unity of the theme I may here digress from the accepted classification, and add that the human memory evinces a particular partiality in regard to money matters. False reminiscences of having already paid something are often very obstinate, as I know from personal experience. When free sway is given to avaricious intent outside of the serious interests of life, when it is indulged in in the spirit of fun, as in card playing, we then find that the most honourable men show an inclination to errors, mistakes in memory and accounts, and without realizing how, they even find themselves involved in small frauds. Such liberties depend in no small part also on the psychically refreshing character of the play. The saying that in play we can learn a person’s character may be admitted if we can add “the repressed character.” If waiters ever make unintentional mistakes they are apparently due to the same mechanism. Among merchants we can frequently observe a certain delay in the paying out of sums of money, in payments of bills and the like, which brings the owner no profit and can be only understood psychologically as the expression of a counter-will against giving out money. Brill sums it up with epigrammatic keenness: “We are more apt to mislay letters containing bills than cheques” (Brill, *Psychanalysis, its Theories and Practical Application*, p. 197).

[15] Translated by A. A. Brill.

VIII. Erroneously Carried-Out Actions

I SHALL give another passage from the above-mentioned work of Meringer and Mayer (p. 98):

"Lapses in speech do not stand entirely alone. They resemble the errors which often occur in our other activities and are quite foolishly termed 'forgetfulness.'"

I am therefore in no way the first to presume that there is a sense and purpose behind the slight functional disturbances of the daily life of healthy people. [1]

If the lapse in speech, which is without doubt a motor function, admits of such a conception, it is quite natural to transfer to the lapses of our other motor functions the same expectation. I have here formed two groups of cases; all these cases in which the faulty effect seems to be the essential element — that is, the deviation from the intention — I denote as erroneously carried-out actions (*Vergreifen*); the others, in which the entire action appears rather inexpedient, I call "symptomatic and chance actions." But no distinct line of demarcation can be formed; indeed, we are forced to conclude that all divisions used in this treatise are of only descriptive significance and contradict the inner unity of the sphere of manifestation.

The psychologic understanding of erroneous actions apparently gains little in clearness when we place it under the head of "ataxia," and especially under "cortical ataxia." Let us rather try to trace the individual examples to their proper determinants. To do this I shall again resort to personal observations, the opportunities for which I could not very frequently find in myself.

(*a*) In former years, when I made more calls at the homes of patients than I do at present, it often happened, when I stood before a door where I should have knocked or rung the bell, that I would pull the key of my own house from my pocket, only to replace it, quite abashed. When I investigated in what patients' homes this occurred, I had to admit that the faulty action — taking out my key instead of ringing the bell — signified paying a certain tribute to the house where the error occurred. It was equivalent to the thought "Here I feel at home," as it happened only where I possessed the patient's regard. (Naturally, I never rang my own door-bell.)

The faulty action was therefore a symbolic representation of a definite thought which was not accepted consciously as serious; for in reality the neurologist is well aware that the patient seeks him only so long as he expects to be benefited by him, and that his own excessively warm interest for his patient is evinced only as a means of psychic treatment.

An almost identical repetition of my experience is described by A. Maeder ("Contrib. à la psychopathologie de la vie quotidienne," *Arch. de Psychol.*, vi., 1906): "Il est arrivè a chacun de sortir son trousseau, en arrivant à la porte d'un ami particulièrement cher, de se surprendre pour ainsi dire, en train d'ouvrir avec sa clé comme chez soi. C'est un retard, puisqu'il faut sonner malgré tout, mais c'est une preuve qu'on se sent — ou qu'on voudrait se sentir — comme chez soi, auprès de cet ami."

Jones speaks as follows about the use of keys: [2] "The use of keys is a fertile source of occurrences of this kind, of which two examples may be given. If I am disturbed in the midst of some engrossing work at home by having to go to the hospital to carry out some routine work, I am very apt to find myself trying to open the door of my laboratory there with the key of my desk at home, although the two keys are quite unlike each other. The mistake unconsciously demonstrates where I would rather be at the moment.

"Some years ago I was acting in a subordinate position at a certain institution, the front door of which was kept locked, so that it was necessary to ring for admission. On several occasions I found myself making serious attempts to open the door with my house key. Each one of the permanent visiting staff, of which I aspired to be a member, was provided with a key to avoid the trouble of having to wait at the door. My mistake thus expressed the desire to be on a similar footing and to be quite 'at home' there."

A similar experience is reported by Dr. Hans Sachs of Vienna: "I always carry two keys with me, one for the door of my office and one for my residence. They are not by any means easily interchanged, as the office key is at least three times as big as my house key. Besides, I carry the first in my trouser pocket and the other in my vest pocket. Yet it often happened that I noticed on reaching the door that while ascending the stairs I had taken out the wrong key. I decided to undertake a statistical examination; as I was daily in about the same emotional state when I stood before both doors, I thought that the interchanging of the two keys must

show a regular tendency, if they were differently determined psychically. Observation of later occurrences showed that I regularly took out my house key before the office door. Only on one occasion was this reversed: I came home tired, knowing that I would find there a guest. I made an attempt to unlock the door with the, naturally too big, office key."

(*b*) At a certain time twice a day for six years I was accustomed to wait for admission before a door in the second story of the same house, and during this long period of time it happened twice (within a short interval) that I climbed a story higher. On the first of these occasions I was in an ambitious day-dream, which allowed me to "mount always higher and higher." In fact, at that time I heard the door in question open as I put my foot on the first step of the third flight. On the other occasion I again went too far "engrossed in thought." As soon as I became aware of it, I turned back and sought to snatch the dominating fantasy; I found that I was irritated over a criticism of my works, in which the reproach was made that I "always went too far," which I replaced by the less respectful expression "climbed too high."

(*c*) For many years a reflex hammer and a tuning-fork lay side by side on my desk. One day I hurried off at the close of my office hours, as I wished to catch a certain train, and, despite broad daylight, put the tuning-fork in my coat pocket in place of the reflex hammer. My attention was called to the mistake through the weight of the object drawing down my pocket. Any one unaccustomed to reflect on such slight occurrences would without hesitation explain the faulty action by the hurry of the moment, and excuse it. In spite of that, I preferred to ask myself why I took the tuning-fork instead of the hammer. The haste could just as well have been a motive for carrying out the action properly in order not to waste time over the correction.

"Who last grasped the tuning-fork?" was the question which immediately flashed through my mind. It happened that only a few days ago an idiotic child, whose attention to sensory impressions I was testing, had been so fascinated by the tuning-fork that I found it difficult to tear it away from him. Could it mean, therefore, that I was an idiot? To be sure, so it would seem, as the next thought which associated itself with the hammer was *chamer* (Hebrew for "ass").

But what was the meaning of this abusive language? We must here inquire into the situation. I hurried to a consultation at a place on the

Western railroad to see a patient who, according to the anamnesis which I received by letter, had fallen from a balcony some months before, and since then had been unable to walk. The physician who invited me wrote that he was still unable to say whether he was dealing with a spinal injury or traumatic neurosis — hysteria. That was what I was to decide. This could therefore be a reminder to be particularly careful in this delicate differential diagnosis. As it is, my colleagues think that hysteria is diagnosed far too carelessly where more serious matters are concerned. But the abuse is not yet justified. Yes, the next association was that the small railroad station is the same place in which, some years previous, I saw a young man who, after a certain emotional experience, could not walk properly. At that time I diagnosed his malady as hysteria, and later put him under psychic treatment; but it afterward turned out that my diagnosis was neither incorrect nor correct. A large number of the patient's symptoms were hysterical, and they promptly disappeared in the course of treatment. But back of these there was a visible remnant that could not be reached by therapy, and could be referred only to a multiple sclerosis. Those who saw the patient after me had no difficulty in recognizing the organic affection. I could scarcely have acted or judged differently, still the impression was that of a serious mistake; the promise of a cure which I had given him could naturally not be kept.

The mistake in grasping the tuning-fork instead of the hammer could therefore be translated into the following words: "You fool, you ass, get yourself together this time, and be careful not to diagnose again a case of hysteria where there is an incurable disease, as you did in this place years ago in the case of the poor man!" And fortunately for this little analysis, even if unfortunately for my mood, this same man, now having a very spastic gait, had been to my office a few days before, one day after the examination of the idiotic child.

We observe that this time it is the voice of self-criticism which makes itself perceptible through the mistake in grasping. The erroneously carried-out action is specially suited to express self-reproach. The present mistake attempts to represent the mistake which was committed elsewhere.

(*d*) It is quite obvious that grasping the wrong thing may also serve a whole series of other obscure purposes. Here is a first example: It is very seldom that I break anything. I am not particularly dexterous, but by virtue

of the anatomic integrity of my nervous and muscular apparatus there are apparently no grounds in me for such awkward movements with undesirable results. I can recall no object in my home the counterpart of which I have ever broken. Owing to the narrowness of my study it has often been necessary for me to work in the most uncomfortable position among my numerous antique clay and stone objects, of which I have a small collection. So much is this true that onlookers have expressed fear lest I topple down something and shatter it. But it never happened. Then why did I brush to the floor the cover of my simple inkwell so that it broke into pieces?

My inkstand is made of a flat piece of marble which is hollowed out for the reception of the glass inkwell; the inkwell has a marble cover with a knob of the same stone. A circle of bronze statuettes with small terra-cotta figures is set behind this inkstand. I seated myself at the desk to write, I made a remarkably awkward outward movement with the hand holding the pen-holder, and so swept the cover of the inkstand, which already lay on the desk, to the floor.

It is not difficult to find the explanation. Some hours before my sister had been in the room to look at some of my new acquisitions. She found them very pretty, and then remarked: “Now the desk really looks very well, only the inkstand does not match. You must get a prettier one.” I accompanied my sister out and did not return for several hours. But then, as it seems, I performed the execution of the condemned inkstand.

Did I perhaps conclude from my sister’s words that she intended to present me with a prettier inkstand on the next festive occasion, and did I shatter the unsightly old one in order to force her to carry out her signified intention? If that be so, then my swinging motion was only apparently awkward; in reality it was most skilful and designed, as it understood how to avoid all the valuable objects located near it.

I actually believe that we must accept this explanation for a whole series of seemingly accidental awkward movements. It is true that on the surface these seem to show something violent and irregular, similar to spastic-ataxic movements, but on examination they seem to be dominated by some intention, and they accomplish their aim with a certainty that cannot be generally credited to conscious arbitrary motions. In both characteristics, the force as well as the sure aim, they show besides a resemblance to the motor manifestations of the hysterical neurosis, and in

part also to the motor accomplishments of somnambulism, which here as well as there point to the same unfamiliar modification of the functions of innervation.

In latter years, since I have been collecting such observations, it has happened several times that I have shattered and broken objects of some value, but the examination of these cases convinced me that it was never the result of accident or of my unintentional awkwardness. Thus, one morning while in my bath-robe and straw slippers I followed a sudden impulse as I passed a room, and hurled a slipper from my foot against the wall so that it brought down a beautiful little marble Venus from its bracket. As it fell to pieces I recited quite unmoved the following verse from Busch: —

"Ach! Die Venus ist perdü — [3]
Klickeradoms! — von Medici!"

This crazy action and my calmness at the sight of the damage is explained in the then existing situation. We had a very sick person in the family, of whose recovery I had personally despaired. That morning I had been informed that there was a great improvement; I know that I had said to myself, "After all she will live." My attack of destructive madness served therefore as the expression of a grateful feeling toward fate, and afforded me the opportunity of performing an "act of sacrifice," just as if I had vowed, "If she gets well I will give this or that as a sacrifice." That I chose the Venus of Medici as this sacrifice was only gallant homage to the convalescent. But even to-day it is still incomprehensible to me that I decided so quickly, aimed so accurately, and struck no other object in close proximity.

Another breaking, in which I utilized a pen-holder falling from my hand, also signified a sacrifice, but this time it was a pious offering to avert some evil. I had once allowed myself to reproach a true and worthy friend for no other reason than certain manifestations which I interpreted from his unconscious activity. He took it amiss and wrote me a letter in which he bade me not to treat my friends by psychoanalysis. I had to admit that he was right and appeased him with my answer. While writing this letter I had before me my latest acquisition — a small, handsome glazed Egyptian figure. I broke it in the manner mentioned, and then immediately knew that I had caused this mischief to avert a greater one. Luckily, both

the friendship and the figure could be so cemented that the break would not be noticed.

A third case of breaking had a less serious connection; it was only a disguised "execution," to use an expression from Th. Vischer's *Auch Einer,* of an object that no longer suited my taste. For quite a while I had carried a cane with a silver handle; through no fault of mine the thin silver plate was once damaged and poorly repaired. Soon after the cane was returned I mirthfully used the handle to angle for the leg of one of my children. In that way it naturally broke, and I got rid of it.

The indifference with which we accept the resulting damage in all these cases may certainly be taken as evidence for the existence of an unconscious purpose in their execution.

(*e*) As can sometimes be demonstrated by analysis, the dropping of objects or the overturning and breaking of the same are very frequently utilized as the expression of unconscious streams of thought, but more often they serve to represent the superstitious or odd significances connected therewith in popular sayings. The meanings attached to the spilling of salt, the overturning of a wineglass, the sticking of a knife dropped to the floor, and so on, are well known. I shall discuss later the right to investigate such superstitious interpretations; here I shall simply observe that the individual awkward acts do not by any means always have the same meaning, but, depending on the circumstances, they serve to represent now this or that purpose.

Recently we passed through a period in my house during which an unusual number of glass and china dishes were broken. I myself largely contributed to this damage. This little endemic was readily explained by the fact that it preceded the public betrothal of my eldest daughter. On such festivities it is customary to break some dishes and utter at the same time some felicitating expression. This custom may signify a sacrifice or express any other symbolic sense.

When servants destroy fragile objects through dropping them, we certainly do not think in the first place of a psychologic motive for it; still, some obscure motives are not improbable even here. Nothing lies farther from the uneducated than the appreciation of art and works of art. Our servants are dominated by a foolish hostility against these productions, especially when the objects, whose worth they do not realize, become a source of a great deal of work for them. On the other hand, persons of the

same education and origin employed in scientific institutions often distinguish themselves by great dexterity and reliability in the handling of delicate objects, as soon as they begin to identify themselves with their masters and consider themselves an essential part of the staff.

I shall here add the report of a young mechanical engineer, which gives some insight into the mechanism of damaging things.

“Some time ago I worked with many others in the laboratory of the High School on a series of complicated experiments on the subject of elasticity. It was a work that we undertook of our own volition, but it turned out that it took up more of our time than we expected. One day, while going to the laboratory with F., he complained of losing so much time, especially on this day, when he had so many other things to do at home. I could only agree with him, and he added half jokingly, alluding to an incident of the previous week: ‘Let us hope that the machine will refuse to work, so that we can interrupt the experiment and go home earlier.’

“In arranging the work, it happened that F. was assigned to the regulation of the pressure valve, that is, it was his duty to carefully open the valve and let the fluid under pressure flow from the accumulator into the cylinder of the hydraulic press. The leader of the experiment stood at the manometer and called a loud ‘Stop!’ when the maximum pressure was reached. At this command F. grasped the valve and turned it with all his force — to the left (all valves, without any exception, are closed to the right). This caused a sudden full pressure in the accumulator of the press, and as there was no outlet, the connecting pipe burst. This was quite a trifling accident to the machine, but enough to force us to stop our work for the day and go home.

“It is characteristic, moreover, that some time later, on discussing this occurrence, my friend F. could not recall the remark that I positively remember his having made.”

Similarly, to fall, to make a misstep, or to slip need not always be interpreted as an entirely accidental miscarriage of a motor action. The linguistic double meaning of these expressions points to diverse hidden fantasies, which may present themselves through the giving up of bodily equilibrium. I recall a number of lighter nervous ailments in women and girls which made their appearance after falling without injury, and which were conceived as traumatic hysteria as a result of the shock of the fall. At that time I already entertained the impression that these conditions had a

different connection, that the fall was already a preparation of the neurosis, and an expression of the same unconscious fantasies of sexual content which may be taken as the moving forces behind the symptoms. Was not this very thing meant in the proverb which says, “When a maiden falls, she falls on her back?”

We can also add to these mistakes the case of one who gives a beggar a gold piece in place of a copper or a silver coin. The solution of such mishandling is simple: it is an act of sacrifice designed to mollify fate, to avert evil, and so on. If we hear a tender mother or aunt express concern regarding the health of a child, directly before taking a walk during which she displays her charity, contrary to her usual habit, we can no longer doubt the sense of this apparently undesirable accident. In this manner our faulty acts make possible the practice of all those pious and superstitious customs which must shun the light of consciousness, because of the strivings against them of our unbelieving reason.

(*f*) That accidental actions are really intentional will find no greater credence in any other sphere than in sexual activity, where the border between the intention and accident hardly seems discernible. That an apparently clumsy movement may be utilized in a most refined way for sexual purposes I can verify by a nice example from my own experience. In a friend’s house I met a young girl visitor who excited in me a feeling of fondness which I had long believed extinct, thus putting me in a jovial, loquacious, and complaisant mood. At that time I endeavoured to find out how this came about, as a year before this same girl made no impression on me.

As the girl’s uncle, a very old man, entered the room, we both jumped to our feet to bring him a chair which stood in the corner. She was more agile than I and also nearer the object, so that she was the first to take possession of the chair. She carried it with its back to her, holding both hands on the edge of the seat. As I got there later and did not give up the claim to carrying the chair, I suddenly stood directly back of her, and with both my arms was embracing her from behind, and for a moment my hands touched her lap. I naturally solved the situation as quickly as it came about. Nor did it occur to anybody how dexterously I had taken advantage of this awkward movement.

Occasionally I have had to admit to myself that the annoying, awkward stepping aside on the street, whereby for some seconds one steps here and

there, yet always in the same direction as the other person, until finally both stop facing each other, that this “barring one’s way” repeats an ill-mannered, provoking conduct of earlier times and conceals erotic purposes under the mask of awkwardness. From my psychoanalysis of neurotics I know that the so-called naïveté of young people and children is frequently only such a mask, employed in order that the subject may say or do the indecent without restraint.

W. Stekel has reported similar observations in regard to himself: “I entered a house and offered my right hand to the hostess. In a most remarkable way I thereby loosened the bow which held together her loose morning-gown. I was conscious of no dishonourable intent, still I executed this awkward movement with the agility of a juggler.”

(*g*) The effects which result from mistakes of normal persons are, as a rule, of a most harmless nature. Just for this reason it would be particularly interesting to find out whether mistakes of considerable importance, which could be followed by serious results, as, for example, those of physicians or druggists, fall within the range of our point of view.

As I am seldom in a position to deal with active medical matters, I can only report one mistake from my own experience. I treated a very old woman, whom I visited twice daily for several years. My medical activities were limited to two acts, which I performed during my morning visits: I dropped a few drops of an eye lotion into her eyes and gave her a hypodermic injection of morphine. I prepared regularly two bottles — a blue one, containing the eye lotion, and a white one, containing the morphine solution. While performing these duties my thoughts were mostly occupied with something else, for they had been repeated so often that the attention acted as if free. One morning I noticed that the automaton worked wrong; I had put the dropper into the white instead of into the blue bottle, and had dropped into the eyes the morphine instead of the lotion. I was greatly frightened, but then calmed myself through the reflection that a few drops of a *two per cent.* solution of morphine would not likely do any harm even if left in the conjunctival sac. The cause of the fright manifestly belonged elsewhere.

In attempting to analyse the slight mistake I first thought of the phrase, “to seize the old woman by mistake,” which pointed out the short way to the solution. I had been impressed by a dream which a young man had told me the previous evening, the contents of which could be explained only on

the basis of sexual intercourse with his own mother. [4] The strangeness of the fact that the Œdipus legend takes no offence at the age of Queen Jocasta seemed to me to agree with the assumption that in being in love with one's mother we never deal with the present personality, but with her youthful memory picture carried over from our childhood. Such incongruities always show themselves where one fantasy fluctuating between two periods is made conscious, and is then bound to one definite period.

Deep in thoughts of this kind, I came to my patient of over ninety; I must have been well on the way to grasp the universal character of the Œdipus fable as the correlation of the fate which the oracle pronounces, for I made a blunder in reference to or on the old woman. Here, again, the mistake was harmless; of the two possible errors, taking the morphine solution for the eye, or the eye lotion for the injection, I chose the one by far the least harmful. The question still remains open whether in mistakes in handling things which may cause serious harm we can assume an unconscious intention as in the cases here discussed.

The following case from Brill's experience corroborates the assumption that even serious mistakes are determined by unconscious intentions: "A physician received a telegram informing him that his aged uncle was very sick. In spite of important family affairs at home he at once repaired to that distant town because his uncle was really his father, who had cared for him since he was one and a half years old, when his own father had died. On reaching there he found his uncle suffering from pneumonia, and, as the old man was an octogenarian, the doctors held out no hope for his recovery. 'It was simply a question of a day or two,' was the local doctor's verdict. Although a prominent physician in a big city, he refused to co-operate in the treatment, as he found that the case was properly managed by the local doctor, and he could not suggest anything to improve matters.

"Since death was daily expected, he decided to remain to the end. He waited a few days, but the sick man struggled hard, and although there was no question of any recovery, because of the many new complications which had arisen, death seemed to be deferred for a while. One night before retiring he went into the sick-room and took his uncle's pulse. As it was quite weak, he decided not to wait for the doctor, and administered a hypodermic injection. The patient grew rapidly worse and died within a few hours. There was something strange in the last symptoms, and on later

attempting to replace the tube of hypodermic tablets into the case, he found to his consternation that he had taken out the wrong tube, and instead of a small dose of digitalis he had given a large dose of hyoscine.

"This case was related to me by the doctor after he read my paper on the Œdipus Complex. [5] We agreed that this mistake was determined not only by his impatience to get home to his sick child, but also by an old resentment and unconscious hostility toward his uncle (father)."

It is known that in the more serious cases of psychoneuroses one sometimes finds self-mutilations as symptoms of the disease. That the psychic conflict may end in suicide can never be excluded in these cases. Thus I know from experience, which some day I shall support with convincing examples, that many apparently accidental injuries happening to such patients are really self-inflicted. This is brought about by the fact that there is a constantly lurking tendency to self-punishment, usually expressing itself in self-reproach, or contributing to the formation of a symptom, which skilfully makes use of an external situation. The required external situation may accidentally present itself or the punishment tendency may assist it until the way is open for the desired injurious effect.

Such occurrences are by no means rare even in cases of moderate severity, and they betray the portion of unconscious intention through a series of special features — for example, through the striking presence of mind which the patients show in the pretended accidents. [6]

I will report exhaustively one in place of many such examples from my professional experience. A young woman broke her leg below the knee in a carriage accident so that she was bedridden for weeks. The striking part of it was the lack of any manifestation of pain and the calmness with which she bore her misfortune. This calamity ushered in a long and serious neurotic illness, from which she was finally cured by psychotherapy. During the treatment I discovered the circumstances surrounding the accident, as well as certain impressions which preceded it. The young woman with her jealous husband spent some time on the farm of her married sister, in company with her numerous other brothers and sisters with their wives and husbands. One evening she gave an exhibition of one of her talents before this intimate circle; she danced artistically the "cancan," to the great delight of her relatives, but to the great annoyance of her husband, who afterward whispered to her, "Again you have behaved

like a prostitute." The words took effect; we will leave it undecided whether it was just on account of the dance. That night she was restless in her sleep, and the next forenoon she decided to go out driving. She chose the horses herself, refusing one team and demanding another. Her youngest sister wished to have her baby with its nurse accompany her, but she opposed this vehemently. During the drive she was nervous; she reminded the coachman that the horses were getting skittish, and as the fidgety animals really produced a momentary difficulty she jumped from the carriage in fright and broke her leg, while those remaining in the carriage were uninjured. Although after the disclosure of these details we can hardly doubt that this accident was really contrived, we cannot fail to admire the skill which forced the accident to mete out a punishment so suitable to the crime. For as it happened "cancan" dancing with her became impossible for a long time.

Concerning self-inflicted injuries of my own experience, I cannot report anything in calm times, but under extraordinary conditions I do not believe myself incapable of such acts. When a member of my family complains that he or she has bitten his tongue, bruised her finger, and so on, instead of the expected sympathy I put the question, "Why did you do that?" But I have most painfully squeezed my thumb, after a youthful patient acquainted me during the treatment with his intention (naturally not to be taken seriously) of marrying my eldest daughter, while I knew that she was then in a private hospital in extreme danger of losing her life.

One of my boys, whose vivacious temperament was wont to put difficulties in the management of nursing him in his illness, had a fit of anger one morning because he was ordered to remain in bed during the forenoon, and threatened to kill himself: a way out suggested to him by the newspapers. In the evening he showed me a swelling on the side of his chest which was the result of bumping against the door knob. To my ironical question why he did it, and what he meant by it, the eleven-year-old child explained, "That was my attempt at suicide which I threatened this morning." However, I do not believe that my views on self-inflicted wounds were accessible to my children at that time.

Whoever believes in the occurrence of semi-intentional self-inflicted injury — if this awkward expression be permitted — will become prepared to accept through it the fact that aside from conscious intentional suicide there also exists semi-intentional annihilation — with unconscious

intention — which is capable of aptly utilizing a threat against life and masking it as a casual mishap. Such mechanism is by no means rare. For the tendency to self-destruction exists to a certain degree in many more persons than in those who bring it to completion. Self-inflicted injuries are, as a rule, a compromise between this impulse and the forces working against it, and even where it really comes to suicide the inclination has existed for a long time with less strength or as an unconscious and repressed tendency.

Even suicide consciously committed chooses its time, means, and opportunity; it is quite natural that unconscious suicide should wait for a motive to take upon itself one part of the causation and thus free it from its oppression by taking up the defensive forces of the person. [7] These are in no way idle discussions which I here bring up; more than one case of apparently accidental misfortune (on a horse or out of a carriage) has become known to me whose surrounding circumstances justified the suspicion of suicide.

For example, during an officers' horse-race one of the riders fell from his horse and was so seriously injured that a few days later he succumbed to his injuries. His behaviour after regaining consciousness was remarkable in more than one way, and his conduct previous to the accident was still more remarkable. He had been greatly depressed by the death of his beloved mother, had crying spells in the society of his comrades, and to his trusted friend had spoken of the *tædium vitæ.* He had wished to quit the service in order to take part in a war in Africa which had no interest for him. [8] Formerly a keen rider, he had later evaded riding whenever possible. Finally, before the horserace, from which he could not withdraw, he expressed a sad foreboding, which most expectedly in the light of our conception came true. It may be contended that it is quite comprehensible without any further cause that a person in such a state of nervous depression cannot manage a horse as well as on normal days. I quite agree with that, only I should like to look for the mechanism of this motor inhibition through "nervousness" in the intention of self-destruction here emphasized.

Dr. Ferenczi has left to me for publication the analysis of an apparently accidental injury by shooting which he explained as an unconscious attempt at suicide. I can only agree with his deduction: —

“J. Ad., 22 years old, carpenter, visited me on the 18th of January, 1908. He wished to know whether the bullet which pierced his left temple March 20, 1907, could or should be removed by operation. Aside from occasional, not very severe, headaches, he felt quite well, also the objective examination showed nothing besides the characteristic powder wound on the left temple, so that I advised against an operation. When questioned concerning the circumstances of the case he asserted that he injured himself accidentally. He was playing with his brother’s revolver, and *believing that it was not loaded* he pressed it with his left hand against the left temple (he is not left-handed), put his finger on the trigger, and the shot went off. *There were three bullets in the six-shooter.*

“I asked him how he came to carry the revolver, and he answered that it was at the time of his army conscription, that he took it to the inn the evening before because he feared fights. At the army examination he was considered unfit for service on account of varicose veins, which caused him much mortification. He went home and played with the revolver. He had no intention of hurting himself, but the accident occurred. On further questioning whether he was otherwise satisfied with his fortune, he answered with a sigh, and related a love affair with a girl who loved him in return, but nevertheless left him. She emigrated to America out of sheer avariciousness. He wanted to follow her, but his parents prevented him. His lady-love left on the 20th of January, 1907, just two months before the accident.

“Despite all these suspicious elements the patient insisted that the shot was an ‘accident.’ I was firmly convinced, however, that the neglect to find out whether the revolver was loaded before he began to play with it, as well as the self-inflicted injury, were psychically determined. He was still under the depressing effects of the unhappy love affair, and apparently wanted ‘to forget everything’ in the army. When this hope, too, was taken away from him he resorted to playing with the weapon — that is, to an unconscious attempt at suicide. The fact that he did not hold the revolver in the right but in the left hand speaks conclusively in favour of the fact that he was really only ‘playing’ — that is, he did not wish consciously to commit suicide.”

Another analysis of an apparently accidental self-inflicted wound, detailed to me by an observer, recalls the saying, “He who digs a pit for others falls in himself.” [9]

“Mrs. X., belonging to a good middle-class family, is married and has three children. She is somewhat nervous, but never needed any strenuous treatment, as she could sufficiently adapt herself to life. One day she sustained a rather striking though transitory disfigurement of her face in the following manner: She stumbled in a street that was in process of repair and struck her face against the house wall. The whole face was bruised, the eyelids blue and œdematous, and as she feared that something might happen to her eyes she sent for the doctor. After she was calmed I asked her, ‘But why did you fall in such a manner?’ She answered that just before this accident she warned her husband, who had been suffering for some months from a joint affection, to be very careful in the street, and she often had the experience that in some remarkable way those things occurred to her against which she warned others.

“I was not satisfied with this as the determination of her accident, and asked her whether she had not something else to tell me. ‘Yes, just before the accident she noticed a nice picture in a shop on the other side of the street, which she suddenly desired as an ornament for her nursery, and wished to buy it at once. She thereupon walked across to the shop without looking at the street, stumbled over a heap of stones, and fell with her face against the wall without making the slightest effort to shield herself with her hands. The intention to buy the picture was immediately forgotten, and she walked home in haste.’

“‘But why were you not more careful?’ I asked.

“‘Oh!’ she answered, ‘perhaps it was only a punishment for that episode which I confided to you!’

“‘Has this episode still bothered you?’

“‘Yes, later I regretted it very much; I considered myself wicked, criminal, and immoral, but at the time I was almost crazy with nervousness.’

“She referred to an abortion which was started by a quack and had to be brought to completion by a gynecologist. This abortion was initiated with the consent of her husband, as both wished, on account of their pecuniary circumstances, to be spared from being additionally blessed with children.

“She said: ‘I had often reproached myself with the words, “You really had your child killed,” and I feared that such a crime could not remain unpunished. Now that you have assured me that there is nothing seriously

wrong with my eyes I am quite assured I have already been sufficiently punished.’

“This accident, therefore, was, on the one hand, a retribution for her sin, but, on the other hand, it may have served as an escape from a more dire punishment which she had feared for many months. In the moment that she ran to the shop to buy the picture the memory of this whole history, with its fears (already quite active in her unconscious at the time she warned her husband), became overwhelming and could perhaps find expression in words like these: ‘But why do you want an ornament for the nursery? — you who had your child killed! You are a murderer! The great punishment is surely approaching!’

“This thought did not become conscious, but instead of it she made use of the situation — I might say of the psychologic moment — to utilize in a commonplace manner the heap of stones to inflict upon herself this punishment. It was for this reason that she did not even attempt to put out her arms while falling and was not much frightened. The second, and probably lesser, determinant of her accident was obviously the self-punishment for her unconscious wish to be rid of her husband, who was an accessory to the crime in this affair. This was betrayed by her absolutely superfluous warning to be very careful in the street on account of the stones. For, just because her husband had a weak leg, he was very careful in walking.”

If such a rage against one’s own integrity and one’s own life can be hidden behind apparently accidental awkwardness and motor insufficiency, then it is not a big step forward to grasp the possibility of transferring the same conception to mistakes which seriously endanger the life and health of others. What I can put forward as evidence for the validity of this conception was taken from my experience with neurotics, and hence does not fully meet the demands of this situation. I will report a case in which it was not an erroneously carried-out action, but what may be more aptly termed a symbolic or chance action that gave me the clue which later made possible the solution of the patient’s conflict.

I once undertook to improve the marriage relations of a very intelligent man, whose differences with his tenderly attached young wife could surely be traced to real causes, but as he himself admitted could not be altogether explained through them. He continually occupied himself with the thought of a separation, which he repeatedly rejected because he dearly loved his

two small children. In spite of this he always returned to that resolution and sought no means to make the situation bearable to himself. Such an unsettlement of a conflict served to prove to me that there were unconscious and repressed motives which enforced the conflicting conscious thoughts, and in such cases I always undertake to end the conflict by psychic analysis. One day the man related to me a slight occurrence which had extremely frightened him. He was sporting with the older child, by far his favourite. He tossed it high in the air and repeated this tossing till finally he thrust it so high that its head almost struck the massive gas chandelier. Almost, but not quite, or say "just about!" Nothing happened to the child except that it became dizzy from fright. The father stood transfixed with the child in his arms, while the mother merged into an hysterical attack. The particular facility of this careless movement, with the violent reaction in the parents, suggested to me to look upon this accident as a symbolic action which gave expression to an evil intention toward the beloved child.

I could remove the contradiction of the actual tenderness of this father for his child by referring the impulse to injure it to the time when it was the only one, and so small that as yet the father had no occasion for tender interest in it. Then it was easy to assume that this man, so little pleased with his wife at that time, might have thought: "If this small being for whom I have no regard whatever should die, I would be free and could separate from my wife." The wish for the death of this much loved being must therefore have continued unconsciously. From here it was easy to find the way to the unconscious fixation of this wish.

There was indeed a powerful determinant in a memory from the patient's childhood: it referred to the death of a little brother, which the mother laid to his father's negligence, and which led to serious quarrels with threats of separation between the parents. The continued course of my patient's life, as well as the therapeutic success confirmed my analysis.

ENDNOTES.

[1] A second publication of Meringer has later shown me how very unjust I was to this author when I attributed to him so much understanding.

[2] Jones, *loc. cit.*, p. 79.

[3] Alas! the Venus of Medici is lost!

[4] The Œdipus dream as I was wont to call it, because it contains the key to the understanding of the legend of King Œdipus. In the text of Sophocles the relation of such a dream is put in the mouth of Jocasta (cf. *The Interpretation of Dreams,* pp. 222–4, etc.).

[5] *New York Medical Journal,* September, 1912. Reprinted in large form as Chapter X of *Psychanalysis,* etc., Saunders, Philadelphia.

[6] The self-inflicted injury which does not entirely tend toward self-annihilation has, moreover, no other choice in our present state of civilization than to hide itself behind the accidental, or to break through in a simulation of spontaneous illness. Formerly, it was a customary sign of mourning, at other times it expressed itself in ideas of piety and renunciation of the world.

[7] The case is then identical with a sexual attack on a woman, in whom the attack of the man cannot be warded off through the full muscular strength of the woman because a portion of the unconscious feelings of the one attacked meets it with ready acceptance. To be sure, it is said that such a situation paralyses the strength of a woman; we need only add the reasons for this paralysis. Insofar the clever sentence of Sancho Panza, which he pronounced as governor of his island, is psychologically unjust (*Don Quixote,* vol. ii. chap. xlv). A woman hauled before the judge a man who was supposed to have robbed her of her honour by force of violence. Sancho indemnified her with a full purse which he took from the accused, but after the departure of the woman he gave the accused permission to follow her and snatch the purse from her. Both returned wrestling, the woman priding herself that the villain was unable to possess himself of the purse. Thereupon Sancho spoke: “Had you shown yourself so stout and valiant to defend your body (nay, but half so much) as you have done to defend your purse, the strength of Hercules could not have forced you.”

[8] It is evident that the situation of a battlefield is such as to meet the requirement of conscious suicidal intent which, nevertheless, shuns the direct way. Cf. in *Wallenstein* the words of the Swedish captain concerning the death of Max Piccolomini: “They say he wished to die.”

IX. Symptomatic and Chance Actions

THE ACTIONS described so far, in which we recognize the execution of an unconscious intention, appeared as disturbances of other unintended actions, and hid themselves under the pretext of awkwardness. Chance actions, which we shall now discuss, differ from erroneously carried out actions only in that they disdain the support of a conscious intention and really need no pretext. They appear independently and are accepted because one does not credit them with any aim or purpose. We execute them "without thinking anything of them," "by mere chance," "just to keep the hands busy," and we feel confident that such information will be quite sufficient should one inquire as to their significance. In order to enjoy the advantage of this exceptional position these actions which no longer claim awkwardness as an excuse must fulfil certain conditions: they must not be striking, and their effects must be insignificant.

I have collected a large number of such "chance actions" from myself and others, and after thoroughly investigating the individual examples, I believe that the name "symptomatic actions" is more suitable. They give expression to something which the actor himself does not suspect in them, and which as a rule he has no intention of imparting to others, but aims to keep to himself. Like the other phenomena considered so far, they thus play the part of symptoms.

The richest output of such chance or symptomatic actions is above all obtained in the psychoanalytic treatment of neurotics. I cannot deny myself the pleasure of showing by two examples of this nature how far and how delicately the determination of these plain occurrences are swayed by unconscious thoughts. The line of demarcation between the symptomatic actions and the erroneously carried out actions is so indefinite that I could have disposed of these examples in the preceding chapter.

(*a*) During the analysis a young woman reproduced this idea which suddenly occurred to her. Yesterday while cutting her nails "she had cut into the flesh while engaged in trimming the cuticle." This is of so little interest that we ask in astonishment why it is at all remembered and mentioned, and therefore come to the conclusion that we deal with a symptomatic action. It was really the finger upon which the wedding-ring is worn which was injured through this slight awkwardness. It happened, moreover, on her wedding-day, which thus gives to the injury of the

delicate skin a very definite and easily guessed meaning. At the same time she also related a dream which alluded to the awkwardness of her husband and her anesthesia as a woman. But why did she injure the ring finger of her left hand when the wedding-ring is worn on the right? Her husband is a jurist, a "Doctor of Laws" (*Doktor der Rechte*, literally a Doctor of Rights), and her secret affection as a girl belonged to a physician who was jokingly called *Doktor der Linke* (literally Doctor of Left). Incidentally a left-handed marriage has a definite meaning.

(*b*) A single young woman relates: "Yesterday, quite unintentionally, I tore a hundred-dollar note in two pieces and gave half to a woman who was visiting me. Is that, too, a symptomatic action?" After closer investigation the matter of the hundred-dollar note elicited the following associations: She dedicated a part of her time and her fortune to charitable work. Together with another woman she was taking care of the rearing of an orphan. The hundred dollars was the contribution sent her by that woman, which she enclosed in an envelope and provisionally deposited on her writing-desk.

The visitor was a prominent woman with whom she was associated in another act of charity. This woman wished to note the names of a number of persons to whom she could apply for charitable aid. There was no paper, so my patient grasped the envelope from her desk, and without thinking of its contents tore it in two pieces, one of which she kept, in order to have a duplicate list of names, and gave the other to her visitor.

Note the harmlessness of this aimless occurrence. It is known that a hundred-dollar note suffers no loss in value when it is torn, provided all the pieces are produced. That the woman would not throw away the piece of paper was assumed by the importance of the names on it, and there was just as little doubt that she would return the valuable content as soon as she noticed it.

But to what unconscious thought should this chance action, which was made possible through forgetfulness, give expression? The visitor in this case had a very definite relation to my patient and myself. It was she who at one time had recommended me as physician to the suffering girl, and if I am not mistaken my patient considered herself indebted for this advice. Should this halved hundred-dollar note perhaps represent a fee for her mediation? That still remained enigmatic.

But other material was added to this beginning. Several days before a woman mediator of a different sort had inquired of a relative whether the gracious young lady wished to make the acquaintance of a certain gentleman, and that morning, some hours before the woman's visit, the wooing letter of the suitor arrived, giving occasion for much mirth. When therefore the visitor opened the conversation with inquiries regarding the health of my patient, the latter could well have thought: "You certainly found me the right doctor, but if you could assist me in obtaining the right husband (and a child) I should be still more grateful."

Both mediators became fused into one in this repressed thought, and she handed the visitor the fee which her fantasy was ready to give the other. This resolution became perfectly convincing when I add that I had told her of such chance or symptomatic actions only the previous evening. She then took advantage of the next occasion to produce an analogous action.

We can undertake a grouping of these extremely frequent chance and symptomatic actions according to their occurrence as habitual, regular under certain circumstances, and as isolated ones. The first group (such as playing with the watch-chain, fingering one's beard, and so on), which can almost serve as a characteristic of the person concerned, is related to the numerous tic movements, and certainly deserves to be dealt with in connection with the latter. In the second group I place the playing with one's cane, the scribbling with one's pencil, the jingling of coins in one's pocket, kneading dough and other plastic materials, all sorts of handling of one's clothing, and many other actions of the same order.

These playful occupations during psychic treatment regularly conceal sense and meaning to which other expression is denied. Generally the person in question knows nothing about it; he is unaware whether he is doing the same thing or whether he has imitated certain modifications in his customary playing, and he also fails to see or hear the effects of these actions. For example, he does not hear the noise which is produced by the jingling of coins, and he is astonished and incredulous when his attention is called to it. Of equal significance to the physician, and worthy of his observation, is everything that one does with his clothing often without noticing it. Every change in the customary attire, every little negligence, such as an unfastened button, every trace of exposure means to express

something that the wearer of the apparel does not wish to say directly, usually he is entirely unconscious of it.

The interpretation of these trifling chance actions, as well as the proof for their interpretation, can be demonstrated every time with sufficient certainty from the surrounding circumstances during the treatment, from the themes under discussion, and from the ideas that come to the surface when attention is directed to the seeming accident. Because of this connection I will refrain from supporting my assertions by reporting examples with their analyses; but I mention these matters because I believe that they have the same meaning in normal persons as in my patients.

I cannot, however, refrain from showing by at least one example how closely an habitually accomplished symbolic action may be connected with the most intimate and important part of the life of a normal individual. [1]

"As Professor Freud has taught us, the symbolism in the infantile life of the normal plays a greater rôle than was expected from earlier psychoanalytic experiences. In view of this the following brief analysis may be of general interest, especially on account of its medical aspects.

"A doctor on rearranging his furniture in a new house came across a straight, wooden stethoscope, and, after pausing to decide where he should put it, was impelled to place it on the side of his writing-desk in such a position that it stood exactly between his chair and the one reserved for his patients. The act in itself was certainly odd, for in the first place the straight stethoscope served no purpose, as he invariably used a binaural one; and in the second place all his medical apparatus and instruments were always kept in drawers, with the sole exception of this one. However, he gave no thought to the matter until one day it was brought to his notice by a patient who had never seen a wooden stethoscope, asking him what it was. On being told, she asked why he kept it there. He answered in an offhand way that that place was as good as any other. This, however, started him thinking, and he wondered whether there had been an unconscious motive in his action. Being interested in the psychoanalytic method, he asked me to investigate the matter.

"The first memory that occurred to him was the fact that when a medical student he had been struck by the habit his hospital interne had of always carrying in his hand a wooden stethoscope on his ward visits,

although he never used it. He greatly admired this interne, and was much attached to him. Later on, when he himself became an interne he contracted the same habit, and would feel very uncomfortable if by mistake he left the room without having the instrument to swing in his hand. The aimlessness of the habit was shown, not only by the fact that the only stethoscope he ever used was a binaural one, which he carried in his pocket, but also in that it was continued when he was a surgical interne and never needed any stethoscope at all.

"From this it was evident that the idea of the instrument in question had in some way or other become invested with a greater psychic significance than normally belongs to it — in other words, that to the subject it stood for more than it does for other people. The idea must have got unconsciously associated with some other one, which it symbolized, and from which it derived its additional fulness of meaning. I will forestall the rest of the analysis by saying what this secondary idea was — namely, a phallic one; the way in which this curious association had been formed will presently be related. The discomfort he experienced in hospital on missing the instrument, and the relief and assurance the presence of it gave him, was related to what is known as a 'castration-complex' — namely, a childhood fear, often continued in a disguised form into adult life, lest a private part of his body should be taken away from him, just as playthings so often were. The fear was due to paternal threats that it would be cut off if he were not a good boy, particularly in a certain direction. This is a very common complex, and accounts for a great deal of general nervousness and lack of confidence in later years.

"Then came a number of childhood memories relating to his family doctor. He had been strongly attached to this doctor as a child, and during the analysis long-buried memories were recovered of a double phantasy he had in his fourth year concerning the birth of a younger sister — namely, that she was the child (1) of himself and his mother, the father being relegated to the background, and (2) of the doctor and himself; in this he thus played both a masculine and feminine part. [2] At the time, when his curiosity was being aroused by the event, he could not help noticing the prominent share taken by the doctor in the proceedings, and the subordinate position occupied by the father: the significance of this for his later life will presently be pointed out.

“The stethoscope association was formed through many connections. In the first place, the physical appearance of the instrument — a straight, rigid, hollow tube, having a small bulbous summit at one extremity and a broad base at the other — and the fact of its being the essential part of the medical paraphernalia, the instrument with which the doctor performed his magical and interesting feats, were matters that attracted his boyish attention. He had had his chest repeatedly examined by the doctor at the age of six, and distinctly recollected the voluptuous sensation of feeling the latter’s head near him pressing the wooden stethoscope into his chest, and of the rhythmic to-and-fro respiratory movement. He had been struck by the doctor’s habit of carrying his stethoscope inside his hat; he found it interesting that the doctor should carry his chief instrument concealed about his person, always handy when he went to see patients, and that he only had to take off his hat (*i.e.,* a part of his clothing) and ‘pull it out.’ At the age of eight he was impressed by being told by an older boy that it was the doctor’s custom to get into bed with his women patients. It is certain that the doctor, who was young and handsome, was extremely popular among the women of the neighbourhood, including the subject’s own mother. The doctor and his ‘instrument’ were therefore the objects of great interest throughout his boyhood.

“It is probable that, as in many other cases, unconscious identification with the family doctor had been a main motive in determining the subject’s choice of profession. It was here doubly conditioned (1) by the superiority of the doctor on certain interesting occasions to the father, of whom the subject was very jealous, and (2) by the doctor’s knowledge of forbidden topics [3] and his opportunity for illicit indulgence. The subject admitted that he had on several occasions experienced erotic temptations in regard to his women patients; he had twice fallen in love with one, and finally had married one.

“The next memory was of a dream, plainly of a homosexual-masochistic nature; in it a man, who proved to be a replacement figure of the family doctor, attacked the subject with a ‘sword.’ The idea of a sword, as is so frequently the case in dreams, represented the same idea that was mentioned above to be associated with that of a wooden stethoscope. The thought of a sword reminded the subject of the passage in the *Nibelung Saga,* where Sigurd sleeps with his naked sword (*Gram*) between him and Brunhilda, an incident that had always greatly struck his imagination.

“The meaning of the symptomatic act now at last became clear. The subject had placed his wooden stethoscope between him and his patients, just as Sigurd had placed his sword (an equivalent symbol) between him and the maiden he was not to touch. The act was a compromise-formation; it served both to gratify in his imagination the repressed wish to enter into nearer relations with an attractive patient (interposition of phallus), and at the same time to remind him that this wish was not to become a reality (interposition of sword). It was, so to speak, a charm against yielding to temptation.

“I might add that the following passage from Lord Lytton’s *Richelieu* made a great impression on the boy: —

‘*Beneath the rule of men entirely great*
The pen is mightier than the sword,’ [4]

and that he became a prolific writer and uses an unusually large fountain-pen. When I asked him what need he had of this pen, he replied in a characteristic manner, ‘I have so much to express.’

“This analysis again reminds us of the profound views that are afforded us in the psychic life through the ‘harmless’ and ‘senseless’ actions, and how early in life the tendency to symbolization develops.”

I can also relate an experience from my psychotherapeutic practice in which the hand, playing with a mass of bread-crumbs, gave evidence of an eloquent declaration. My patient was a boy not yet thirteen years of age, who had been very hysterical for two years. I finally took him for psychoanalytic treatment, after a lengthy stay at a hydrotherapeutic institution had proved futile. My supposition was that he must have had sexual experiences, and that, corresponding to his age, he had been troubled by sexual questions; but I was cautious about helping him with explanations as I wished to test further my assumption. I was therefore curious as to the manner in which the desired material would evince itself in him.

One day it struck me that he was rolling something between the fingers of his right hand; he would thrust it into his pocket and there continue playing with it, then would draw it out again, and so on. I did not ask what he had in his hand; but as he suddenly opened his hand he showed it to me. It was bread-crumbs kneaded into a mass. At the next session he again brought along a mass, and in the course of our conversation, although his eyes were closed, modelled a figure with an incredible rapidity which

excited my interest. Without doubt it was a manikin like the crudest prehistoric idols, with a head, two arms, two legs, and an appendage between the legs which he drew out to a long point.

This was scarcely completed when he kneaded the manikin together again: later he allowed it to remain, but modelled an identical appendage on the flat of the back and on other parts in order to veil the meaning of the first. I wished to show him that I had understood him, but at the same time I wanted to deprive him of the evasion that he had thought of nothing while actively forming these figures. With this intention I suddenly asked him whether he remembered the story of the Roman king who gave his son's envoy a pantomimic answer in his garden.

The boy did not wish to recall what he must have learned so much more recently than I. He asked if that was the story of the slave on whose bald skull the answer was written. I told him, "No, that belonged to Greek history," and related the following: "King Tarquinius Superbus had induced his son Sextus to steal into a Latin city. The son, who had later obtained a foothold in the city, sent a messenger to the king asking what steps he should take next. The king gave no answer, but went into his garden, had the question repeated there, and silently struck off the heads of the largest and most beautiful poppies. All that the messenger could do was to report this to Sextus, who understood his father, and caused the most distinguished citizens of the city to be removed by assassination."

While I was speaking the boy stopped kneading, and as I was relating what the king did in his garden, I noticed that at the words "silently struck" he tore off the head of the manikin with a movement as quick as lightning. He therefore understood me, and showed that he was also understood by me. Now I could question him directly, and gave him the information that he desired, and in a short time the neurosis came to an end.

The symptomatic actions which we observe in inexhaustible abundance in healthy as well as in nervous people are worthy of our interest for more than one reason. To the physician they often serve as valuable indications for orienting himself in new or unfamiliar conditions; to the keen observer they often betray everything, occasionally even more than he cares to know. He who is familiar with its application sometimes feels like King Solomon, who, according to the Oriental legend, understood the language of animals.

One day I was to examine a strange young man at his mother's home. As he came towards me I was attracted by a large stain on his trousers, which by its peculiar stiff edges I recognized as one produced by albumen. After a moment's embarrassment the young man excused this stain by remarking that he was hoarse and therefore drank a raw egg, and that some of the slippery white of the egg had probably fallen on his clothes. To confirm his statements he showed the eggshell which could still be seen on a small plate in the room. The suspicious spot was thus explained in this harmless way; but as his mother left us alone I thanked him for having so greatly facilitated the diagnosis for me, and without further procedure I took as the topic of our discussion his confession that he was suffering from the effects of masturbation.

Another time I called on a woman as rich as she was miserly and foolish, who was in the habit of giving the physician the task of working his way through a heap of her complaints before he could reach the simple cause of her condition. As I entered she was sitting at a small table engaged in arranging silver dollars in little piles: as she rose she tumbled some of the pieces of money to the floor. I helped her pick them up, but interrupted the recitation of her misery by remarking: "Has your good son-in-law been spending so much of your money again?" She bitterly denied this, only to relate a few moments later the lamentable story of the aggravation caused by her son-in-law's extravagances. And she has not sent for me since. I cannot maintain that one always makes friends of those to whom he tells the meaning of their symptomatic actions.

He who observes his fellow-men while at table will be able to verify in them the nicest and most instructive symptomatic actions.

Dr. Hans Sachs relates the following: —

"I happened to be present when an elderly couple related to me partook of their supper. The lady had stomach trouble and was forced to follow a strict diet. A roast was put before the husband, and he requested his wife, who was not allowed to partake of this food, to give him the mustard. The wife opened the closet and took out the small bottle of stomach drops, and placed it on the table before her husband. Between the barrel-shaped mustard-glass and the small drop-bottle there was naturally no similarity through which the mishandling could be explained; yet the wife only noticed the mistake after her husband laughingly called her attention to it. The sense of this symptomatic action needs no explanation."

For an excellent example of this kind which was very skilfully utilized by the observer, I am indebted to Dr. Bernh. Dattner (Vienna): —

"I dined in a restaurant with my colleague H., a doctor of philosophy. He spoke about the injustice done to probationary students, and added that even before he finished his studies he was placed as secretary to the ambassador, or rather the extraordinary plenipotentiary Minister to Chili. 'But,' he added, 'the minister was afterwards transferred, and I did not make any effort to meet the newly appointed.' While uttering the last sentence he was lifting a piece of pie to his mouth, but he let it drop as if out of awkwardness. I immediately grasped the hidden sense of this symptomatic action, and remarked to my colleague, who was unacquainted with psychoanalysis, 'You really allowed a very choice morsel to slip from you.' He did not realize, however, that my words could equally refer to his symptomatic action, and he repeated the same words I uttered with a peculiarly agreeable and surprising vividness, as if I had actually taken the words from his mouth: 'It was really a very choice morsel that I allowed to get away from me.' He then followed this remark with a detailed description of his clumsiness, which has cost him this very remunerative position.

"The sense of this symbolic action becomes clearer if we remember that my colleague had scruples about telling me, almost a perfect stranger, concerning his precarious material situation, and his repressed thought took on the mask of symptomatic action which expressed symbolically what was meant to be concealed, and the speaker thus got relief from his unconscious."

That the taking away or taking along things without any apparent intention may prove to be senseful may be shown by the following examples.

1. Dr. B. Dattner relates: "An acquaintance paid the first after-marriage visit to a highly regarded lady friend of his youth. He told me of this visit and expressed his surprise at the fact that he failed in his resolution to visit with her only a short time, and then reported to me a rather strange faulty act which happened to him there.

"The husband of this friend, who took part in the conversation, was looking for a box of matches which he was sure was on the table when he came there. My acquaintance, too, looked through his pockets to ascertain whether he had not put it in his pocket, but without avail. Some time later

he actually found it in his pocket, and was struck by the fact that there was only one match in the box.

"A dream a few days later showing the box symbolism in reference to the friend of his youth confirmed my explanation. With the symptomatic action my acquaintance meant to announce his priority-right and the exclusiveness of his possession (it contained only one match)."

Dr. Hans Sachs relates the following: "Our cook is very fond of a certain kind of pie. There is no possible doubt about this, as it is the only kind of pastry which she always prepares well. One Sunday she brought this pie to the table, took it off the pie-plate, and proceeded to remove the dishes used in the former course, but on the top of this pile she placed the pie, and disappeared with it into the kitchen. We first thought that she had something to improve on the pie, but as she failed to appear my wife rang the bell and asked, 'Betty, what happened to the pie?' to which the girl answered, without comprehending the question, 'How is that?' We had to call her attention to the fact that she carried the pie back to the kitchen. She had put it on the pile of dishes, taken it out, and put it away 'without noticing it.'

"The next day, when we were about to consume the rest of the pie, my wife noticed that there was as much of it as we had left the day before — that is, the girl had disdained to eat the portion of her favourite dish which was rightly hers. Questioned why she did not eat the pie, she answered, somewhat embarrassed, that she did not care for it.

"The infantile attitude is distinctly noticeable on both occasions — first the childish insatiableness in refusing to share with anybody the object of her wishes, then the reaction of spite which is just as childish: 'If you grudge it to me, keep it for yourself, I want nothing of it.'"

Chance or symptomatic actions occurring in affairs of married life have often a most serious significance, and could lead those who do not concern themselves with the psychology of the unconscious to a belief in omens. It is not an auspicious beginning if a young woman loses her wedding-ring on her wedding-tour, even if it were only mislaid and soon found.

I know a woman, now divorced, who in the management of her business affairs frequently signed her maiden name many years before she actually resumed it.

Once I was the guest of a newly married couple and heard the young woman laughingly relate her latest experience, how, on the day succeeding

her return from the wedding tour she had sought out her single sister in order to go shopping with her as in former times, while her husband was attending business. Suddenly she noticed a man on the opposite side of the street; nudging her sister she said, “Why, that is surely Mr. L.” She forgot that for some weeks this man had been her husband. I was chilled at this tale, but I did not dare draw any inferences. The little story came back to me only several years later, after this marriage had ended most unhappily.

The following observation, which could as well have found a place among the examples of forgetting, was taken from a noteworthy work published in French by A. Maeder. [5]

“Une dame nous racontait récement qu’elle avait oublie d’essayer sa robe de noce et s’en souvint la veille du marriage, à huit heur du soir, la couturière désespérait de voir sa cliente. Ce détail suffit à montrer que la fiancée ne se sentait pas très hereuse de porter une robe d’épouse, elle cherchait à oublier cette représentation pénible. Elle est aujourd’hui … divorcée.”

A friend who has learned to observe signs related to me that the great actress Eleanora Duse introduces a symptomatic action into one of her rôles which shows very nicely from what depth she draws her acting. It is a drama dealing with adultery; she has just been discussing with her husband and now stands soliloquizing before the seducer makes his appearance. During this short interval she plays with her wedding-ring, she pulls it off, replaces it, and finally takes it off again. She is now ready for the other.

I know of an elderly man who married a young girl, and instead of starting at once on his wedding tour he decided to spend the night in a hotel. Scarcely had they reached the hotel, when he noticed with fright that he was without his wallet, in which he had the entire sum of money for the wedding tour; he must have mislaid or lost it. He was still able to reach his servant by telephone; the latter found the missing article in the coat discarded for the travelling clothes and brought it to the hotel to the waiting bridegroom, who had thus entered upon his marriage without means.

It is consoling to think that the “losing of objects” by people is merely an unsuspected extension of a symptomatic action, and is thus welcome at least to the secret intention of the loser. Often it is only an expression of slight appreciation of the lost article, a secret dislike for the same, or

perhaps for the person from whom it came, or the desire to lose this object was transferred to it from other and more important objects through symbolic association. The loss of valuable articles serves as an expression of diverse feelings; it may either symbolically represent a repressed thought — that is, it may bring back a memory which one would rather not hear — or it may represent a sacrifice to the obscure forces of fate, the worship of which is not yet entirely extinct even with us. [6]

The following examples will illustrate these statements concerning the losing of objects: —

Dr. B. Dattner states: “A colleague related to me that he lost his steel pencil which he had had for over two years, and which, on account of its superior quality, was highly prized by him. Analysis elicited the following facts: The day before he had received a very disagreeable letter from his brother-in-law, the concluding sentence of which read: ‘At present I have neither the desire nor the time to assist you in your carelessness and laziness.’ The effect connected with this letter was so powerful that the next day he promptly sacrificed the pencil which was a present from this brother-in-law in order not to be burdened with his favours.”

Brill reports the following example: “A doctor took exception to the following statement in my book, ‘We never lose what we really want’ (*Psychanalysis, its Theories and Practical Application,* p. 214). His wife, who is very interested in psychologic subjects, read with him the chapter on “Psychopathology of Everyday Life”; they were both very much impressed with the novelty of the ideas, and so on, and were very willing to accept most of the statements. He could not, however, agree with the above-given statement because, as he said to his wife, ‘I surely did not wish to lose my knife.’ He referred to a valuable knife given to him by his wife, which he highly prized, the loss of which caused him much pain.

“It did not take his wife very long to discover the solution for this loss in a manner to convince them both of the accuracy of my statement. When she presented him with this knife he was a bit loath to accept it. Although he considered himself quite emancipated, he nevertheless entertained some superstition about giving or accepting a knife as a gift, because it is said that a knife cuts friendship. He even remarked this to his wife, who only laughed at his superstition. He had the knife for years before it disappeared.

“Analysis brought out the fact that the disappearance of the knife was directly connected with a period when there were violent quarrels between himself and his wife, which threatened to end in separation. They lived happily together until his step-daughter (it was his second marriage) came to live with them. His daughter was the cause of many misunderstandings, and it was at the height of these quarrels that he lost the knife.

“The unconscious activity is very nicely shown in this symptomatic action. In spite of his apparent freedom from superstition, he still unconsciously believed that a donated knife may cut friendship between the persons concerned. The losing of it was simply an unconscious defence against losing his wife, and by sacrificing the knife he made the superstitious ban impotent.”

In a lengthy discussion and with the aid of dream analysis, [7] Otto Rank made clear the sacrificial tendency with its deep-reaching motivation. It must be said that just such symptomatic actions often give us access to the understanding of the intimate psychic life of the person.

Of the many isolated chance-actions, I will relate one example which showed a deeper meaning even without analysis. This example clearly explains the conditions under which such symptoms may be produced most casually, and also shows that an observation of practical importance may be attached to it. During a summer tour it happened that I had to wait several days at a certain place for the arrival of my travelling companions. In the meantime I made the acquaintance of a young man, who also seemed lonely and was quite willing to join me. As we lived at the same hotel it was quite natural that we should take all our meals and our walks together.

On the afternoon of the third day he suddenly informed me that he expected his wife to arrive on that evening’s express train. My psychologic interest was now aroused, as it had already struck me that morning that my companion rejected my proposal to make a long excursion, and in our short walk he objected to a certain path as too steep and dangerous. During our afternoon walk he suddenly thought that I must be hungry and insisted that I should not delay my evening meal on his account, that he would not sup before his wife’s arrival. I understood the hint and seated myself at the table while he went to the station.

The next morning we met in the foyer of the hotel. He presented me to his wife, and added, “Of course, you will breakfast with us?” I had to

attend first to a small matter in the next street, but assured him that I would return shortly. Later, as I entered the breakfast-room, I noticed that the couple were at a small table near the window, both seated on the same side of it. On the opposite side there was only one chair, which was covered, however, with a man's large and heavy coat. I understood well the meaning of this unintentional, none the less expressive, disposition of the coat. It meant this: "There is no room for you here, you are superfluous now."

The man did not notice that I remained standing before the table, being unable to take the seat, but his wife noticed it, and quickly nudged her husband and whispered: "Why, you have covered the gentleman's place with your coat."

These as well as other similar experiences have caused me to think that the actions executed unintentionally must inevitably become the source of misunderstanding in human relations. The perpetrator of the act, who is unaware of any associated intention, takes no account of it, and does not hold himself responsible for it. On the other hand, the second party, having regularly utilized even such acts as those of his partner to draw conclusions as to their purpose and meaning, recognizes more of the stranger's psychic processes than the latter is ready either to admit or believe that he has imparted. He becomes indignant when these conclusions drawn from his symptomatic actions are held up to him; he declares them baseless because he does not see any conscious intention in their execution, and complains of being misunderstood by the other. Close examination shows that such misunderstandings are based on the fact that the person is too fine an observer and understands too much. The more "nervous" two persons are the more readily will they give each other cause for disputes, which are based on the fact that one as definitely denies about his own person what he is sure to accept about the other.

And this is, indeed, the punishment for the inner dishonesty to which people grant expression under the guise of "forgetting," of erroneous actions and accidental emotions, a feeling which they would do better to confess to themselves and others when they can no longer control it. As a matter of fact it can be generally affirmed that every one is continually practising psychoanalysis on his neighbours, and consequently learns to know them better than each individual knows himself. The road following

the admonition [Greek] leads through the study of one's own apparently casual commissions and omissions.

ENDNOTES.

[6] Here is another small collection of various symptomatic actions in normal and neurotic persons. An elderly colleague who does not like to lose at cards had to pay one evening a large sum of money in consequence of his losses; he did this without complaint, but with a peculiar constrained temper. After his departure it was discovered that he had left at this place practically everything he had with him, spectacles, cigar-case, and handkerchief. That would be readily translated into the words: "You robbers, you have nicely plundered me." A man who suffers from occasional sexual impotence, which has its origin in the intimacy of his infantile relations to his mother, relates that he is in the habit of embellishing pamphlets and notes with an S, the initial of his mother's name. He cannot bear the idea of having letters from home come in contact with other unsanctified correspondence, and therefore finds it necessary to keep the former separate. A young woman suddenly flings open the door of the consulting-room while her predecessor is still present. She excused herself on the ground of "thoughtlessness"; it soon came to light that she demonstrated her curiosity which caused her at an earlier time to intrude into the bedroom of her parents. Girls who are proud of their beautiful hair know so well how to manipulate combs and hairpins, that in the midst of conversation their hair becomes loosened. During the treatment (in a reclining position) some men scatter change from their pockets and thus pay for the hour of treatment; the amount scattered is in proportion to their estimation of the work. Whoever forgets articles in the doctor's office, such as eye-glasses, gloves, handbags, generally indicates that he cannot tear himself away and is anxious to return soon. Ernest Jones says: "One can almost measure the success with which a physician is practising psychotherapy, for instance, by the size of the collection of umbrellas, handkerchiefs, purses, and so on, that he could make in a month. The slightest habits and acts performed with a minimum of attention, such as the winding of a clock before retiring to sleep, the putting out of lights before leaving the room, and similar actions, are occasionally subject to disturbances which clearly demonstrate the influence of the unconscious complex, and what is thought to be the strongest "habits."

In the journal *Cœnobium,* Maeder relates about a hospital physician who, on account of an important matter, desired to get to the city that evening, although he was on duty and had no right

to leave the hospital. On his return he noticed to his surprise that there was a light in his room. On leaving the room he had forgotten to put it out, something that had never happened before. But he soon grasped the motive of this forgetting. The hospital superintendent who lived in the same house must have concluded from the light in the room that he was at home. A man overburdened with worries and subject to occasional depressions assured me that he regularly forgot to wind his watch on those evenings when life seemed too hard and unfriendly. In this omission to wind his watch he symbolically expressed that it was a matter of indifference to him whether he lived to see the next day. Another man who was personally unknown to me wrote: "Having been struck by a terrible misfortune, life appeared so harsh and unsympathetic, that I imagined that I had not sufficient strength to live to see the next day. I then noticed that almost every day I forgot to wind my watch, something that I never omitted before. I had been in the habit of doing it regularly before retiring in an almost mechanical and unconscious manner. It was only very seldom that I thought of it, and that happened when I had something important for the next day which held my interest. Should this be considered a symptomatic action? I really cannot explain it." Whoever will take the trouble, like Jung (*The Psychology of Dementia Præcox*, translated by Peterson and Brill), or Maeder ("Une voie nouvelle en Psychologie — Freud et son ecole," *Cœnobium*, Lugano, 1906), to pay attention to melodies which one hums to himself aimlessly and unconsciously, will regularly discover the relation of the melody's text to a theme which occupies the person at that time.

X. Errors

ERRORS of memory are distinguished from forgetting and false recollections through one feature only, namely, that the error (false recollection) is not recognized as such but finds credence. However, the use of the expression “error” seems to depend on still another condition. We speak of “erring” instead of “falsely recollecting” where the character of the objective reality is emphasized in the psychic material to be reproduced — that is, where something other than a fact of my own psychic life is to be remembered, or rather something that mat be confirmed or refuted through the memory of others. The reverse of the error in memory in this sense is formed by ignorance.

In my book *The Interpretation of Dreams,* [1] I was responsible for a series of errors in historical, and above all, in material facts, which I was astonished to discover after the appearance of the book. On closer examination I found that they did not originate from my ignorance, but could be traced to errors of memory explainable by means of analysis.

(*a*) On page 361 I indicated as *Schiller’s* birthplace the city of *Marburg,* a name which recurs in *Styria.* The error is found in the analysis of a dream during a night journey from which I was awakened by the conductor calling out the name of the station *Marburg.* In the contents of the dream inquiry is made concerning a book by *Schiller.* But *Schiller* was not born in the university town of *Marburg* but in the Swabian city *Marbach.* I maintain that I always knew this.

(*b*) On page 165 *Hannibal’s* father is called *Hasdrubal.* This error was particularly annoying to me, but it was most corroborative of my conception of such errors. Few readers of the book are better posted on the history of the *Barkides* than the author who wrote this error and overlooked it in three proofs. The name of Hannibal’s father was *Hamilcar Barkas; Hasdrubal* was the name of *Hannibal’s* brother as well as that of his brother-in-law and predecessor in command.

(*c*) On pages 217 and 492 I assert that *Zeus* emasculates his father *Kronos,* and hurls him from the throne. This horror I have erroneously advanced by a generation; according to Greek mythology it was *Kronos* who committed this on his father *Uranos.* [2]

How is it to be explained that my memory furnished me with false material on these points, while it usually places the most remote and

unusual material at my disposal, as the readers of my books can verify? And, what is more, in three carefully executed proof-readings I passed over these errors as if struck blind.

Goethe said of Lichtenberg: “Where he cracks a joke, there lies a concealed problem.” Similarly we can affirm of these passages cited from my book: back of every error is a repression. More accurately stated: the error conceals a falsehood, a disfigurement which is ultimately based on repressed material. In the analysis of the dreams there reported, I was compelled by the very nature of the theme to which the dream thoughts related, on the one hand, to break off the analysis in some places before it had reached its completion, and on the other hand, to remove an indiscreet detail through a slight disfigurement of its outline. I could not act differently, and had no other choice if I was at all to offer examples and illustrations. My constrained position was necessarily brought about by the peculiarity of dreams, which give expression to repressed thoughts, or to material which is incapable of becoming conscious. In spite of this it is said that enough material remained to offend the more sensitive souls. The disfigurement or concealment of the continuing thoughts known to me could not be accomplished without leaving some trace. What I wished to repress has often against my will obtruded itself on what I have taken up, and evinced itself in the matter as an unnoticeable error. Indeed, each of the three examples given is based on the same theme: the errors are the results of repressed thoughts which occupy themselves with my deceased father.

(*ad a*) Whoever reads through the dream analysed on page 361 will find some parts unveiled; in some parts he will be able to divine through allusions that I have broken off the thoughts which would have contained an unfavourable criticism of my father. In the continuation of this line of thoughts and memories there lies an annoying tale, in which books and a business friend of my father, named *Marburg*, play a part; it is the same name the calling out of which in the southern railway-station had aroused me from sleep. I wished to suppress this Mr. *Marburg* in the analysis from myself and my readers: he avenged himself by intruding where he did not belong, and changed the name of Schiller’s birthplace from *Marbach* to *Marburg.*

(*ad b*) The error *Hasdrubal* in place of *Hamilcar,* the name of the brother instead of that of the father, originated from an association which

dealt with the Hannibal fantasies of my college years and my dissatisfaction with the conduct of my father towards the “enemies of our people.” I could have continued and recounted how my attitude toward my father was changed by a visit to England, where I made the acquaintance of my half-brother, by a previous marriage of my father. My brother’s oldest son was my age exactly. Thus the age relations were no hindrance to a fantasy which may be stated thus: how much pleasanter it would be had I been born the son of my brother instead of the son of my father! This suppressed fantasy then falsified the text of my book at the point where I broke off the analysis, by forcing me to put the name of the brother for that of the father.

(*ad c*) The influence of the memory of this same brother is responsible for my having advanced by a generation the mythological horror of the Greek deities. One of the admonitions of my brother has lingered long in my memory. “Do not forget one thing concerning your conduct in life,” he said: “you belong not to the second but really to the third generation of your father.” Our father had remarried at an advanced age, and was therefore an old man to his children by the second marriage. I commit the error mentioned where I discuss the piety between parents and children.

Several times friends and patients have called my attention to the fact that in reporting their dreams or alluding to them in dream analyses, I have related inaccurately the circumstances experienced by us in common. These are also historic errors. On re-examining such individual cases I have found that my recollection of the facts was unreliable only where I had purposely disfigured or concealed something in the analysis. Here again we have *an unobserved error as a substitute for an intentional concealment or repression.*

From these errors, which originate from repression, we must sharply distinguish those which are based on actual ignorance. Thus, for example, it was ignorance when on my excursion to Wachau I believed that I had passed the resting-place of the revolutionary leader Fischof. Only the name is common to both places. *Fischof’s Emmersdorf* is located in Kärnthen. But I did not know any better.

Here is another embarrassing but instructive error, an example of temporary ignorance if you like. One day a patient reminded me to give him the two books on Venice which I had promised him, as he wished to use them in planning his Easter tour. I answered that I had them ready and

went into the library to fetch them, though the truth of the matter was that I had forgotten to look them up, since I did not quite approve of my patient's journey, looking upon it as an unnecessary interruption to the treatment, and as a material loss to the physician. Thereupon I made a quick survey of the library for the books.

One was *Venedig als Kunststätte*, and besides this I imagined I had an historic work of a similar order. Certainly there was *Die Mediceer* (*The Medicis*); I took them and brought them in to him, then, embarrassed, I confessed my error. Of course I really knew that the Medicis had nothing to do with Venice, but for a short time it did not appear to me at all incorrect. Now I was compelled to practise justice; as I had so frequently interpreted my patient's symptomatic actions I could save my prestige only by being honest and admitting to him the secret motives of my averseness to his trip.

It may cause general astonishment to learn how much stronger is the impulse to tell the truth than is usually supposed. Perhaps it is a result of my occupation with psychoanalysis that I can scarcely lie any more. As often as I attempt a distortion I succumb to an error or some other faulty act, which betrays my dishonesty, as was manifest in this and in the preceding examples.

Of all faulty actions the mechanism of the error seems to be the most superficial. That is, the occurrence of the error invariably indicates that the mental activity concerned had to struggle with some disturbing influence, although the nature of the error need not be determined by the quality of the disturbing idea, which may have remained obscure. It is not out of place to add that the same state of affairs may be assumed in many simple cases of lapses in speaking and writing. Every time we commit a lapse in speaking or writing we may conclude that through mental processes there has come a disturbance which is beyond our intention. It may be conceded, however, that lapses in speaking and writing often follow the laws of similarity and convenience, or the tendency to acceleration, without allowing the disturbing element to leave a trace of its own character in the error resulting from the lapses in speaking or writing. It is the responsiveness of the linguistic material which at first makes possible the determination of the error, but it also limits the same.

In order not to confine myself exclusively to personal errors I will relate a few examples which could just as well have been ranged under

“Lapses in Speech” or under “Erroneously Carried-out Actions,” but as all these forms of faulty action have the same value they may as well be reported here.

(*a*) I forbade a patient to speak on the telephone to his lady-love, with whom he himself was willing to break off all relations, as each conversation only renewed the struggling against it. He was to write her his final decision, although there were some difficulties in the way of delivering the letter to her. He visited me at one o’clock to tell me that he had found a way of avoiding these difficulties, and among other things he asked me whether he might refer to me in my professional capacity.

At two o’clock while he was engaged in composing the letter of refusal, he interrupted himself suddenly, and said to his mother, “Well, I have forgotten to ask the Professor whether I may use his name in the letter.” He hurried to the telephone, got the connection, and asked the question, “May I speak to the Professor after his dinner?” In answer he got an astonished “Adolf, have you gone crazy!” The answering voice was the very voice which at my command he had listened to for the last time. He had simply “made a mistake,” and in place of the physician’s number had called up that of his beloved.

(*b*) During a summer vacation a schoolteacher, a poor but excellent young man, courted the daughter of a summer resident, until the girl fell passionately in love with him, and even prevailed upon her family to countenance the matrimonial alliance in spite of the difference in position and race. One day, however, the teacher wrote his brother a letter in which he said: “Pretty, the lass is not at all, but she is very amiable, and so far so good. But whether I can make up my mind to marry a Jewess I cannot yet tell.” This letter got into the hands of the fiancée, who put an end to the engagement, while at the same time his brother was wondering at the protestations of love directed to him. My informer assured me that this was really an error and not a cunning trick.

I am familiar with another case in which a woman who was dissatisfied with her old physician, and still did not openly wish to discharge him, accomplished this purpose through the interchange of letters. Here, at least, I can assert confidently that it was error and not conscious cunning that made use of this familiar comedy-motive.

(*c*) Brill [3] tells of a woman who, inquiring about a mutual friend, erroneously called her by her maiden name. Her attention having been

directed to this error, she had to admit that she disliked her friend's husband and had never been satisfied with her marriage.

Maeder [4] relates a good example of how a reluctantly repressed wish can be satisfied by means of an "error." A colleague wanted to enjoy his day of leave of absence absolutely undisturbed, but he also felt that he ought to go to Lucerne to pay a call which he did not anticipate with any pleasure. After long reflection, however, he concluded to go. For pastime on the train he read the daily newspapers. He journeyed from Zurich to Arth Goldau, where he changed trains for Lucerne, all the time engrossed in reading. Presently the conductor informed him that he was in the wrong train — that is, he had got into the one which was returning from Goldau to Zurich, whereas his ticket was for Lucerne.

A very similar trick was played by me quite recently. I had promised my oldest brother to pay him a long-due visit at a sea-shore in England; as the time was short I felt obliged to travel by the shortest route and without interruption. I begged for a day's sojourn in Holland, but he thought that I could stop there on my return trip. Accordingly I journeyed from Munich through Cologne to Rotterdam — Hook of Holland — where I was to take the steamer at midnight to Harwich. In Cologne I had to change cars; I left my train to go into the Rotterdam express, but it was not to be found. I asked various railway employees, was sent from one platform to another, got into an exaggerated state of despair, and could easily reckon that during this fruitless search I had probably missed my connection.

After this was corroborated, I pondered whether or not I should spend the night in Cologne. This was favoured by a feeling of piety, for according to an old family tradition, my ancestors were once expelled from this city during a persecution of the Jews. But eventually I came to another decision; I took a later train to Rotterdam, where I arrived late at night and was thus compelled to spend a day in Holland. This brought me the fulfilment of a long-fostered wish — the sight of the beautiful Rembrandt paintings at The Hague and in the Royal Museum at Amsterdam. Not before the next forenoon, while collecting my impressions during the railway journey in England, did I definitely remember that only a few steps from the place where I got off at the railroad station in Cologne, indeed, on the same platform, I had seen a large sign, "Rotterdam — Hook of Holland." There stood the train in which I should have continued my journey.

If one does not wish to assume that, contrary to my brother's orders, I had really resolved to admire the Rembrandt pictures on my way to him, then the fact that despite clear directions I hurried away and looked for another train must be designated as an incomprehensible "blinding." Everything else — my well-acted perplexity, the emergence of the pious intention to spend the night in Cologne — was only a contrivance to hide my resolution until it had been fully accomplished.

One may possibly be disinclined to consider the class of errors which I have here explained as very numerous or particularly significant. But I leave it to your consideration whether there is no ground for extending the same points of view also to the more important errors of judgment, as evinced by people in life and science. Only for the most select and most balanced minds does it seem possible to guard the perceived picture of external reality against the distortion to which it is otherwise subjected in its transit through the psychic individuality of the one perceiving it.

ENDNOTES.

[1] Translated by A. A. Brill. The Macmillan Company, New York; George Allen Company, London.

[2] This is not a perfect error. According to the orphic version of the myth the emasculation was performed by Zeus on his father Kronos.

XI. Combined Faulty Acts

TWO of the last-mentioned examples, my error which transfers the Medici to Venice and that of the young man who knew how to circumvent a command against a conversation on the telephone with his lady love, have really not been fully discussed, as after careful consideration they may be shown to represent a union of forgetting with an error. I can show the same union still more clearly in certain other examples.

(*a*) A friend related to me the following experience: “Some years ago I consented to be elected to the committee of a certain literary society, as I supposed the organization might some time be of use to me in assisting me in the production of my drama. Although not much interested, I attended the meetings regularly every Friday. Some months ago I was definitely assured that one of my dramas would be presented at the theatre in F., and since that time it regularly happened that I forgot the meeting of the association. As I read their programme announcements I was ashamed of my forgetfulness. I reproached myself, feeling that it was certainly rude of me to stay away now when I no longer needed them, and determined that I would certainly not forget the next Friday. Continually I reminded myself of this resolution until the hour came and I stood before the door of the meeting-room. To my astonishment it was locked; the meeting was already over. I had mistaken my day; it was already Saturday!

(*b*) The next example is the combination of a symptomatic action with a case of mislaying; it reached me by remote byways, but from a reliable source.

A woman travelled to Rome with her brother-in-law, a renowned artist. The visitor was highly honoured by the German residents of Rome, and among other things received a gold medal of antique origin. The woman was grieved that her brother-in-law did not sufficiently appreciate the value of this beautiful gift. After she had returned home she discovered in unpacking that — without knowing how — she had brought the medal home with her. She immediately notified her brother-in-law of this by letter, and informed him that she would send it back to Rome the next day. The next day, however, the medal was so aptly mislaid that it could not be found and could not be sent back, and then it dawned on the woman what her “absent-mindedness” signified — namely, that she wished to keep the medal herself.

(*c*) Here are some cases in which the falsified action persistently repeats itself, and at the same time also changes its mode of action: —

Due to unknown motives, Jones [1] left a letter for several days on his desk, forgetting each time to post it. He ultimately posted it, but it was returned to him from the Dead-letter Office because he forgot to address it. After addressing and posting it a second time it was again returned to him, this time without a stamp. He was then forced to recognize the unconscious opposition to the sending of the letter.

(*d*) A short account by Dr. Karl Weiss (Vienna) [2] of a case of forgetting impressively describes the futile effort to accomplish something in the face of opposition. “How persistently the unconscious activity can achieve its purpose if it has cause to prevent a resolution from being executed, and how difficult it is to guard against this tendency, will be illustrated by the following incident: An acquaintance requested me to lend him a book and bring it to him the next day. I immediately promised it, but perceived a distinct feeling of displeasure which I could not explain at the time. Later it became clear to me: this acquaintance had owed me for years a sum of money which he evidently had no intention of returning. I did not give this matter any more thought, but I recalled it the following forenoon with the same feeling of displeasure, and at once said to myself: ‘Your unconscious will see to it that you forget the book, but you don’t wish to appear unobliging and will therefore do everything not to forget it.’ I came home, wrapped the book in paper, and put it near me on the desk while I wrote some letters.

“A little later I went away, but after a few steps I recollected that I had left on the desk the letters which I wished to post. (By the way, one of the letters was written to a person who urged me to undertake something disagreeable.) I returned, took the letters, and again left. While in the street-car it occurred to me that I had undertaken to purchase something for my wife, and I was pleased at the thought that it would be only a small package. The association, ‘small package,’ suddenly recalled ‘book’ — and only then I noticed that I did not have the book with me. Not only had I forgotten it when I left my home the first time, but I had overlooked it again when I got the letters near which it lay.”

(*e*) A similar mechanism is shown in the following fully analysed observation of Otto Rank: — [3]

“A scrupulously orderly and pedantically precise man reported the following occurrence, which he considered quite remarkable: One afternoon on the street wishing to find out the time, he discovered that he had left his watch at home, an omission which to his knowledge had never occurred before. As he had an engagement elsewhere and had not enough time to return for his watch, he made use of a visit to a woman friend to borrow her watch for the evening. This was the most convenient way out of the dilemma, as he had a previous engagement to visit this lady the next day. Accordingly, he promised to return her watch at that time.

“But the following day when about to consummate this he found to his surprise that he had left the watch at home; his own watch he had with him. He then firmly resolved to return the lady’s property that same afternoon, and even followed out his resolution. But on wishing to see the time on leaving her he found to his chagrin and astonishment that he had again forgotten to take his own watch.

“The repetition of this faulty action seemed so pathologic to this order-loving man that he was quite anxious to know its psychologic motivation, and when questioned whether he experienced anything disagreeable on the critical day of the first forgetting, and in what connection it had occurred, the motive was promptly found. He related that he had conversed with his mother after luncheon, shortly before leaving the house. She told him that an irresponsible relative, who had already caused him much worry and loss of money, had pawned his (the relative’s) watch, and, as it was needed in the house, the relative had asked for money to redeem it. This almost “forced” loan affected our man very painfully and brought back to his memory all the disagreeable episodes perpetrated by this relative for many years.

“His symptomatic action therefore proves to be manifoldly determined. First, it gives expression to a stream of thought which runs perhaps as follows: ‘I won’t allow my money to be extorted this way, and if a watch is needed I will leave my own at home.’ But as he needed it for the evening to keep his appointment, this intention could only be brought about on an unconscious path in the form of a symptomatic action. Second, the forgetting expresses a sentiment something like the following: ‘This everlasting sacrificing of money for this good-for-nothing is bound to ruin me altogether, so that I will have to give up everything.’ Although the anger, according to the report of this man, was only momentary, the

repetition of the same symptomatic action conclusively shows that in the unconscious it continued to act more intensely, and may be equivalent to the conscious expression: ‘I cannot get this story out of my head. [4] That the lady’s watch should later meet the same fate will not surprise us after knowing this attitude of the unconscious.’

“Yet there may be still other special motives which favour the transference on the ‘innocent’ lady’s watch. The nearest motive is probably that he would have liked to keep it as a substitute for his own sacrificed watch, and that hence he forgot to return it the next day. He also might have liked to possess this watch as a souvenir of the lady. Moreover, the forgetting of the lady’s watch gave him the excuse for calling on the admired one a second time; for he was obliged to visit her in the morning in reference to another matter, and with the forgetting of the watch he seemed to indicate that this visit for which an appointment had been made so long ago was too good for him to be used simply for the return of a watch.

“Twice forgetting his own watch and thus making possible the substitution of the lady’s watch speaks for the fact that our man unconsciously endeavoured to avoid carrying both watches at the same time. He obviously thought of avoiding the appearance of superfluity which would have stood out in striking contrast to the want of the relative; but, on the other hand, he utilized this as a self-admonition against his apparent intention to marry this lady, reminding himself that he was tied to his family (mother) by indissoluble obligations.

“Finally, another reason for the forgetting of the lady’s watch may be sought in the fact that the evening before he, a bachelor, was ashamed to be seen with a lady’s watch by his friends, so that he only looked at it stealthily, and in order to evade the repetition of this painful situation he could not take the watch along. But as he was obliged to return it, there resulted here, too, an unconsciously performed symptomatic action which proved to be a compromise formation between conflicting emotional feelings and a dearly bought victory of the unconscious instance.”

In the same discussion Rank has also paid attention to the very interesting relation of “faulty actions and dreams,” which cannot, however, be followed here without a comprehensive analysis of the dream with which the faulty action is connected. I once dreamed at great length that I had lost my pocket-book. In the morning while dressing I actually missed

it; while undressing the night before the dream I had forgotten to take it out of my trousers pocket and put it in its usual place. This forgetting was therefore not unknown to me; probably it was to give expression to an unconscious thought which was ready to appear in the dream content.

I do not mean to assert that such cases of combined faulty actions can teach anything new that we have not already seen in the individual cases. But this change in form of the faulty action, which nevertheless attains the same result, gives the plastic impression of a will working towards a definite end, and in a far more energetic way contradicts the idea that the faulty action represents something fortuitous and requires no explanation. Not less remarkable is the fact that the conscious intention thoroughly fails to check the success of the faulty action. Despite all, my friend did not pay his visit to the meeting of the literary society, and the woman found it impossible to give up the medal. That unconscious something which worked against these resolutions found another outlet after the first road was closed to it. It requires something other than the conscious counter-resolution to overcome the unknown motive; it requires a psychic work which makes the unknown known to consciousness.

ENDNOTES.

[1] *Loc. cit.,* p. 42.

[2] *Zentralb. f. Psychoanalyse,* ii. 9.

[3] *Zentralb. f. Psychoanalyse,* ii. 5.

[4] This continued action in the unconscious manifested itself once in the form of a dream which followed the faulty action, another time in the repetition of the same or in the omission of a correction.

XII. Determinism — Chance — and Superstitious Beliefs

Points of View.

AS the general result of the preceding separate discussions we must put down the following principle: *Certain inadequacies of our psychic capacities — whose common character will soon be more definitely determined — and certain performances which are apparently unintentional prove to be well motivated when subjected to the psychoanalytic investigation, and are determined through the consciousness of unknown motives.*

In order to belong to this class of phenomena thus explained a faulty psychic action must satisfy the following conditions: —

(*a*) It must not exceed a certain measure, which is firmly established through our estimation, and is designated by the expression "within normal limits."

(*b*) It must evince the character of the momentary and temporary disturbance. The same action must have been previously performed more correctly or we must always rely on ourselves to perform it more correctly; if we are corrected by others we must immediately recognize the truth of the correction and the incorrectness of our psychic action.

(*c*) If we at all perceive a faulty action, we must not perceive in ourselves any motivation of the same, but must attempt to explain it through "inattention" or attribute it to an "accident."

Thus there remain in this group the cases of forgetting and the errors, despite better knowledge, the lapses in speaking, reading, writing, the erroneously carried-out actions, and the so-called chance actions. The explanations of these so definite psychic processes are connected with a series of observations which may in part arouse further interest.

I. By abandoning a part of our psychic capacity as unexplainable through purposive ideas we ignore the realms of determinism in our mental life. Here, as in still other spheres, determinism reaches farther than we suppose. In the year 1900 I read an essay published in the *Zeit* written by the literary historian R. M. Meyer, in which he maintains, and illustrates by examples, that it is impossible to compose nonsense intentionally and arbitrarily. For some time I have been aware that it is impossible to think of a number, or even of a name, of one's own free will. If one investigates this seeming voluntary formation, let us say, of a

number of many digits uttered in unrestrained mirth, it always proves to be so strictly determined that the determination seems impossible. I will now briefly discuss an example of an “arbitrarily chosen” first name, and then exhaustively analyse an analogous example of a “thoughtlessly uttered” number.

While preparing the history of one of my patients for publication I considered what first name I should give her in the article. There seemed to be a wide choice; of course, certain names were at once excluded by me, in the first place the real name, then the names of members of my family to which I would have objected, also some female names having an especially peculiar pronunciation. But, excluding these, there should have been no need of being puzzled about such a name. It would be thought, and I myself supposed, that a whole multitude of feminine names would be placed at my disposal. Instead of this only one sprang up, no other besides it; it was the name Dora.

I inquired as to its determination: “Who else is called Dora?” I wished to reject the next idea as incredulous; it occurred to me that the nurse of my sister’s children was named Dora. But I possess so much self-control, or practice in analysis, if you like, that I held firmly to the idea and proceeded. Then a slight incident of the previous evening soon flashed through my mind which brought the looked-for determination. On my sister’s dining-room table I noticed a letter bearing the address, “Miss Rosa W.” Astonished, I asked whose name this was, and was informed that the right name of the supposed Dora was really Rosa, and that on accepting the position she had to lay aside her name, because Rosa would also refer to my sister. I said pityingly, “Poor people! They cannot even retain their own names!” I now recall that on hearing this I became quiet for a moment and began to think of all sorts of serious matters which merged into the obscure, but which I could now easily bring into my consciousness. Thus when I sought a name for a person *who could not retain her own name* no other except “Dora” occurred to me. The exclusiveness here is based, moreover, on firmer internal associations, for in the history of my patient it was a stranger in the house, the governess, who exerted a decisive influence on the course of the treatment.

This slight incident found its unexpected continuation many years later. While discussing in a lecture the long-since published history of the girl called Dora it occurred to me that one of my two women pupils had the

very name Dora which I was obliged to utter so often in the different associations of the case. I turned to the young student, whom I knew personally, with the apology that I had really not thought that she bore the same name, and that I was ready to substitute it in my lecture by another name.

I was now confronted with the task of rapidly choosing another name, and reflected that I must not now choose the first name of the other woman student, and so set a poor example to the class, who were already quite conversant with psychoanalysis. I was therefore well pleased when the name “Erna” occurred to me as the substitute for Dora, and Erna I used in the discourse. After the lecture I asked myself whence the name “Erna” could possibly have originated, and had to laugh as I observed that the feared possibility in the choice of the substitutive name had come to pass, in part at least. The other lady’s family name was Lucerna, of which Erna was a part.

In a letter to a friend I informed him that I had finished reading the proof-sheets of *The Interpretation of Dreams,* and that I did not intend to make any further changes in it, “even if it contained *2,467* mistakes.” I immediately attempted to explain to myself the number, and added this little analysis as a postscript to the letter. It will be best to quote it now as I wrote it when I caught myself in this transaction: —

“I will add hastily another contribution to the Psychopathology of Everyday Life. You will find in the letter the number 2,467 as a jocose and arbitrary estimation of the number of errors that may be found in the dream-book. I meant to write: no matter how large the number might be, and this one presented itself. But there is nothing arbitrary or undetermined in the psychic life. You will therefore rightly suppose that the unconscious hastened to determine the number which was liberated by consciousness. Just previous to this I had read in the paper that General E. M. had been retired as Inspector-General of Ordnance. You must know that I am interested in this man. While I was serving as military medical student he, then a colonel, once came into the hospital and said to the physician: ‘You must make me well in eight days, as I have some work to do for which the Emperor is waiting.’

“At that time I decided to follow this man’s career, and just think, to-day (1899) he is at the end of it — Inspector-General of Ordnance and already retired. I wished to figure out in what time he had covered this

road, and assumed that I had seen him in the hospital in 1882. That would make 17 years. I related this to my wife, and she remarked, ‘Then you, too, should be retired.’ And I protested, ‘The Lord forbid!’ After this conversation I seated myself at the table to write to you. The previous train of thought continued, and for good reason. The figuring was incorrect; I had a definite recollection of the circumstances in my mind. I had celebrated my coming of age, my *24th* birthday, in the military prison (for being absent without permission). Therefore I must have seen him in 1880, which makes it 19 years ago. You then have the number 24 in 2,467! Now take the number that represents my age, 43, and add 24 years to it and you get *67!* That is, to the question whether I wished to retire I had expressed the wish to work 24 years more. Obviously I am annoyed that in the interval during which I followed Colonel M. I have not accomplished much myself, and still there is a sort of triumph in the fact that he is already finished, while I still have all before me. Thus we may justly say that not even the unintentionally thrown-out number 2,467 lacks its determination from the unconscious.”

Since this first example of the interpretation of an apparently arbitrary choice of a number I have repeated a similar test with the same result; but most cases are of such intimate content that they do not lend themselves to report.

It is for this reason that I shall not hesitate to add here a very interesting analysis of a “chance number” which Dr. Alfred Adler (Vienna) received from a “perfectly healthy” man. [1] A. wrote to me: “Last night I devoted myself to the *Psychopathology of Everyday Life,* and I would have read it all through had I not been hindered by a remarkable coincidence. When I read that every number that we apparently conjure up quite arbitrarily in our consciousness has a definite meaning, I decided to test it. The number 1,734 occurred to my mind. The following associations then came up: 1,734/17=102; 102/17=6. I then separated the number into 17 and 34. I am 34 years old. I believe that I once told you that I consider 34 the last year of youth, and for this reason I felt miserable on my last birthday. The end of my 17th year was the beginning of a very nice and interesting period of my development. I divide my life into periods of 17 years. What do the divisions signify? The number 102 recalls the fact that volume 102 of the Reclam Universal Library is Kotzebue’s play *Menschenhass und Reue* (*Human Hatred and Repentance*).

“My present psychic state is ‘human hatred and repentance.’ No. 6 of the U. L. (I know a great many numbers by heart) is Mullner’s ‘Schuld’ (Fault). I am constantly annoyed at the thought that it is through my own fault that I have not become what I could have been with my abilities.

“I then asked myself, ‘What is No. 17 of the U. L.?’ But I could not recall it. But as I positively knew it before, I assumed that I wished to forget this number. All reflection was in vain. I wished to continue with my reading, but I read only mechanically without understanding a word, for I was annoyed by the number 17. I extinguished the light and continued my search. It finally came to me that number 17 must be a play by Shakespeare. But which one? I thought of Hero and Leander. Apparently a stupid attempt of my will to distract me. I finally arose and consulted the catalogue of the U. L. Number 17 was *Macbeth!* To my surprise I had to discover that I knew nothing of the play, despite the fact that it did not interest me any less than any other Shakespearean drama. I only thought of: murder, Lady Macbeth, witches, ‘nice is ugly,’ and that I found Schiller’s version of *Macbeth* very nice. Undoubtedly I also wished to forget the play. Then it occurred to me that 17 and 34 may be divided by 17 and result in 1 and 2. Numbers 1 and 2 of the U. L. is Goethe’s *Faust*. Formerly I found much of Faust in me.”

We must regret that the discretion of the physician did not allow us to see the significance of ideas. Adler remarked that the man did not succeed in the synthesis of his analysis. His association would hardly be worth reporting unless their continuation would bring out something that would give us the key to the understanding of the number 1,734 and the whole series of ideas.

To quote further: “To be sure this morning I had an experience which speaks much for the correctness of the Freudian conception. My wife, whom I awakened through my getting up at night, asked me what I wanted with the catalogue of the U. L. I told her the story. She found it all pettifogging but — very interesting. *Macbeth*, which caused me so much trouble, she simply passed over. She said that nothing came to her mind when she thought of a number. I answered, ‘Let us try it.’ She named the number 117. To this I immediately replied: ‘17 refers to what I just told you; furthermore, I told you yesterday that if a wife is in the 82nd year and the husband is in the 35th year it must be a gross misunderstanding.’ For

the last few days I have been teasing my wife by maintaining that she was a little old mother of 82 years. 82+35=117."

The man who did not know how to determine his own number at once found the solution when his wife named a number which was apparently arbitrarily chosen. As a matter of fact, the woman understood very well from which complex the number of her husband originated, and chose her own number from the same complex, which was surely common to both, as it dealt in his case with their relative ages. Now, we find it easy to interpret the number that occurred to the man. As Dr. Adler indicates, it expressed a repressed wish of the husband which, fully developed, would read: "For a man of 34 years as I am, only a woman of 17 would be suitable."

Lest one should think too lightly of such "playing," I will add that I was recently informed by Dr. Adler that a year after the publication of this analysis the man was divorced from his wife. [2]

Adler gives a similar explanation for the origin of obsessive numbers. Also the choice of so-called "favourite numbers" is not without relation to the life of the person concerned, and does not lack a certain psychologic interest. A gentleman who evinced a particular partiality for the numbers 17 and 19 could specify, after brief reflection, that at the age of 17 he attained the greatly longed-for academic freedom by having been admitted to the university, that at 19 he made his first long journey, and shortly thereafter made his first scientific discovery. But the fixation of this preference followed later, after two questionable affairs, when the same numbers were invested with importance in his "love-life."

Indeed, even those numbers which we use in a particular connection extremely often and with apparent arbitrariness can be traced by analysis to an unexpected meaning. Thus, one day it struck one of my patients that he was particularly fond of saying, "I have already told you this from 17 to 36 times." And he asked himself whether there was any motive for it. It soon occurred to him that he was born on the 27th day of the month, and that his younger brother was born on the 26th day of another month, and he had grounds for complaint that Fate had robbed him of so many of the benefits of life only to bestow them on his younger brother. Thus he represented this partiality of Fate by deducting 10 from the date of his birth and adding it to the date of his brother's birthday. I am the elder and yet am so "cut short."

I shall tarry a little longer at the analysis of chance numbers, for I know of no other individual observation which would so readily demonstrate the existence of highly organized thinking processes of which consciousness has no knowledge. Moreover, there is no better example of analysis in which the suggestion of the position, a frequent accusation, is so distinctly out of consideration. I shall therefore report the analysis of a chance number of one of my patients (with his consent), to which I will only add that he is the youngest of many children and that he lost his beloved father in his young years.

While in a particularly happy mood he let the number *426,718* come to his mind, and put to himself the question, “Well, what does it bring to your mind?” First came a joke he had heard: “If your catarrh of the nose is treated by a doctor it lasts 42 days, if it is not treated it lasts — 6 weeks.” This corresponds to the first digit of the number (42=6x7). During the obstruction that followed this first solution I called his attention to the fact that the number of six digits selected by him contains all the first numbers except 3 and 5. He at once found the continuation of this solution: —

“We were altogether 7 children, I was the youngest. Number 3 in the order of the children corresponds to my sister A., and 5 to my brother L.; both of them were my enemies. As a child I used to pray to the Lord every night that He should take out of my life these two tormenting spirits. It seems to me that I have fulfilled for myself this wish: ‘3’ and ‘5,’ the *evil* brother and the hated sister, are omitted.”

“If the number stands for your sisters and brothers, what significance is there to 18 at the end? You were altogether only 7.”

“I often thought if my father had lived longer I should not have been the youngest child. If one more would have come, we should have been 8, and there would have been a younger child, toward whom I could have played the role of the older one.”

With this the number was explained, but we still wished to find the connection between the first part of the interpretation and the part following it. This came very readily from the condition required for the last digits — if the father had lived longer. 42=6x7 signifies the ridicule directed against the doctors who could not help the father, and in this way expresses the wish for the continued existence of the father. The whole number really corresponds to the fulfilment of his two wishes in reference to his family circle — namely, that both the evil brother and sister should

die and that another little child should follow him. Or, briefly expressed: *If only these two had died in place of my father!* [3]

Another analysis of numbers I take from Jones. [4] A gentleman of his acquaintance let the number 986 come to his mind, and defied him to connect it to anything of special interest in his mind. “Six years ago, on the hottest day he could remember, he had seen a joke in an evening newspaper, which stated that the thermometer had stood at 98.6°F., evidently an exaggeration of 98.6°F. We were at the time seated in front of a very hot fire, from which he had just drawn back, and he remarked, probably quite correctly, that the heat had aroused his dormant memory. However, I was curious to know why this memory had persisted with such vividness as to be so readily brought out, for with most people it surely would have been forgotten beyond recall, unless it had become associated with some other mental experience of more significance.

“He told me that on reading the joke he had laughed uproariously, and that on many subsequent occasions he had recalled it with great relish. As the joke was obviously of an exceedingly tenuous nature, this strengthened my expectation that more lay behind. His next thought was the general reflection that the conception of heat had always greatly impressed him, that heat was the most important thing in the universe, the source of all life, and so on. This remarkable attitude of a quite prosaic young man certainly needed some explanation, so I asked him to continue his free associations. The next thought was of a factory stack which he could see from his bedroom window. He often stood of an evening watching the flame and smoke issuing out of it, and reflecting on this deplorable waste of energy. Heat, flame, the source of life, the waste of vital energy issuing from an upright, hollow tube — it was not hard to divine from such associations that the ideas of heat and fire were unconsciously linked in his mind with the idea of love, as is so frequent in symbolic thinking, and that there was a strong masturbation complex present, a conclusion that he presently confirmed.”

Those who wish to get a good impression of the way the material of numbers becomes elaborated in the unconscious thinking, I refer to two papers by Jung [5] and Jones. [6]

In personal analysis of this kind two things were especially striking. First, the absolute somnambulistic certainty with which I attacked the unknown objective point, merging into a mathematical train of thought,

which later suddenly extended to the looked-for number, and the rapidity with which the entire subsequent work was performed. Secondly, the fact that the numbers were always at the disposal of my unconscious mind, when as a matter of fact I am a poor mathematician and find it very difficult to consciously recall years, house numbers, and the like. Moreover, in these unconscious mental operations with figures I found a tendency to superstition, the origin of which had long remained unknown to me.

It will not surprise us to find that not only numbers but also mental occurrences of different kinds of words regularly prove on analytic investigation to be well determined.

Brill relates: “While working on the English edition of this book I was obsessed one morning with the strange word ‘Cardillac.’ Busily intent on my work, I refused at first to pay attention to it, but, as is usually the case, I simply could not do anything else. ‘Cardillac’ was constantly in my mind. Realizing that my refusal to recognize it was only a resistance, I decided to analyse it. The following associations occurred to me: *Cardillac, cardiac, carrefour, Cadillac.*

“*Cardiac* recalled cardalgia — heartache — a medical friend who had recently told me confidentially that he feared that he had some cardiac affection because he had suffered some attacks of pain in the region of his heart. Knowing him so well, I at once rejected his theory, and told him that his attacks were of a neurotic character, and that his other apparent physical ailments were also only the expression of his neurosis.

“I might add that just before telling me of his heart trouble he spoke of a business matter of vital interest to him which had suddenly come to naught. Being a man of unbounded ambitions, he was very depressed because of late he had suffered many similar reverses. His neurotic conflicts, however, had become manifest a few months before this misfortune. Soon after his father’s death had left a big business on his hands. As the business could be continued only under my friend’s management, he was unable to decide whether to enter into commercial life or continue his chosen career. His great ambition was to become a successful medical practitioner, and although he had practised medicine successfully for many years, he was not altogether satisfied with the financial fluctuations of his professional income. On the other hand, his

father's business promised him an assured, though limited, return. In brief, he was 'at a crossing and did not know which way to turn.'

"I then recalled the word *carrefour,* which is the French for 'crossing,' and it occurred to me that while working in a hospital in Paris I lived near the 'Carrefour St. Lazarre.' And now I could understand what relation all these associations had for me.

"When I resolved to leave the State Hospital I made the decision, first, because I desired to get married, and, secondly, because I wished to enter private practice. This brought up a new problem. Although my State hospital service was an absolute success, judging by promotions and so on, I felt like a great many others in the same situation, namely, that my training was ill suited for private practice. To specialize in mental work was a daring undertaking for one without money and social connections. I also felt that the best I could do for patients should they ever come my way would be to commit them to one of the hospitals, as I had little confidence in the home treatment in vogue. In spite of the enormous advances made in recent years in mental work, the specialist is almost helpless when he is confronted with the average case of insanity. This may be partially attributed to the fact that such cases are brought to him after they have fully developed the psychosis when hospital treatment is imperative. Of the great army of milder mental disturbances, the so-called border-line cases, which make up the bulk of clinic and private work and which rightfully belong to the mental specialist, I knew very little, as those patients rarely, or never, came to the State hospital, and what I did know concerning the treatment of neurasthenia and psychasthenia was not conducive to make me more hopeful of success in private practice.

"It was in this state of mind that I came to Paris, where I hoped to learn enough about the psychoneuroses to enable me to continue my specialty in private practice, and yet feel that I could do something for my patients. What I saw in Paris did not, however, help to change my state of mind. There, too, most of the work was directed to dead tissues. The mental aspects, as such, received but scant attention. I was, therefore, seriously thinking of giving up my mental work for some other specialty. As can be seen, I was confronted with a situation similar to the one of my medical friend. I, too, was at a crossing and did not know which way to turn. My suspense was soon ended. One day I received a letter from my friend Professor Peterson, who, by the way, was responsible for my entering the

State hospital service. In this letter he advised me not to give up my work, and suggested the psychiatric clinic of Zurich, where he thought I could find what I desired.

"But what does *Cadillac* mean? Cadillac is the name of a hotel and of an automobile. A few days before in a country place my medical friend and I had been trying to hire an automobile, but there was none to be had. We both expressed the wish to own an automobile — again an unrealized ambition. I also recalled that the 'Carrefour St. Lazarre' always impressed me as being one of the busiest thoroughfares in Paris. It was always congested with automobiles. Cadillac also recalled that only a few days ago on the way to my clinic I noticed a large sign over a building which announced that on a certain day 'this building was to be occupied by the Cadillac,' etc. This at first made me think of the Cadillac Hotel, but on second sight I noticed that it referred to the Cadillac motorcar. There was a sudden obstruction here for a few moments. The word Cadillac reappeared and by sound association the word *catalogue* occurred to me. This word brought back a very mortifying occurrence of recent origin, the motive of which is again blighted ambition.

"When one wishes to report any auto-analysis he must be prepared to lay bare many intimate affairs of his own life. Any one reading carefully Professor Freud's works cannot fail to become intimately acquainted with him and his family. I have often been asked by persons who claim to have read and studied Freud's works such questions as: 'How old is Freud?' 'Is Freud married?' 'How many children has he?' etc. Whenever I hear these or similar questions I know that the questioner has either lied when he made these assertions, or, to be more charitable, that he is a very careless and superficial reader. All these questions and many more are answered in Freud's works. Auto-analyses are autobiographies *par excellence;* but whereas the autobiographer may for definite reasons consciously and unconsciously hide many facts of his life, the auto-analyst not only tells the truth consciously, but perforce brings to light his whole intimate personality. It is for these reasons that one finds it very unpleasant to report his own auto-analyses. However, as we often report our patients' unconscious productions, it is but fair that we should sacrifice ourselves on the altar of publicity when occasion demands. This is my apology for having thrust some of my personal affairs on the reader, and for being obliged to continue a little longer in the same strain.

“Before digressing with the last remarks I mentioned that the word *Cadillac* brought the sound association *catalogue*. This association brought back another important epoch in my life with which Professor Peterson is connected. Last May I was informed by the secretary of the faculty that I was appointed chief of clinic of the department of psychiatry. I need hardly say that I was exceedingly pleased to be so honoured — in the first place because it was the realization of an ambition which I dared entertain only under special euphoric states; and, secondly, it was a compensation for the many unmerited criticisms from those who are blindly and unreasonably opposing some of my work. Soon thereafter I called on the stenographer of the faculty and spoke to her about a correction to be made in my name as it was printed in the catalogue. For some unknown reason (perhaps racial prejudice) this stenographer, a maiden lady, must have taken a dislike to me. For about three years I repeatedly requested her to have this correction made, but she had paid no attention to me. To be sure she always promised to attend to it, but the mistake remained uncorrected.

“When I saw her last May I again reminded her of this correction, and also called her attention to the fact that as I had been appointed chief of clinic I was especially anxious to have my name correctly printed in the catalogue. She apologized for her remissness and assured me that everything should be as I requested. Imagine my surprise and chagrin when on receiving the new catalogue I found that while the correction had been made in my name I was not listed as chief of clinic. When I asked her about this she was quite puzzled; she said she had no idea that I had been appointed chief of clinic. She had to consult the minutes of the faculty, written by herself, before she was convinced of it. It should be noted that as recorder to the faculty it was her duty to know all these things as soon as they transpired. [7] When she finally ascertained that I was right she was very apologetic and informed me that she would at once write to the superintendent of the clinic to inform him of my appointment, something which she should have done months before. Of course I gained nothing by her regrets and apologies. The catalogue was published and those who read it did not find my name in the desired place. I am chief of clinic in fact but not in name. Moreover, as the appointments are made only for one year, it is quite likely that my great ambition will never be actually realized.

“Thus the obsessive neologism *cardillac,* which is a condensation of *cardiac, Cadillac,* and *catalogue,* contains some of the most important efforts of my medical experience. When I was almost at the end of this analysis I suddenly recalled a dream containing this neologism cardillac in which my wish was realized. My name appeared in its rightful place in the catalogue. The person who showed it to me in the dream was Professor Peterson. It was when I was at the first ‘crossing’ after I had graduated from the medical college that Professor Peterson urged me to enter the hospital service. About five years later while I was in the state of indecision which I have described, it was Professor Peterson who advised me to go to the clinic of psychiatry at Zurich where through Bleuler and Jung I first became acquainted with Professor Freud and his works, and it was also through the kind recommendation of Dr. Peterson that I was elevated to my present position.”

I am indebted to Dr. Hitschman for the solution of another case in which a line of poetry repeatedly obtruded itself on the mind in a certain place without showing any trace of its origin and relation.

Related by Dr. E.: “Six years ago I travelled from Biarritz to San Sebastian. The railroad crosses over the Bidassao — a river which here forms the boundary between France and Spain. On the bridge one has a splendid view, on the one side of the broad valley and the Pyrenees and on the other of the sea. It was a beautiful, bright summer day; everything was filled with sun and light. I was on a vacation and pleased with my trip to Spain. Suddenly the following words came to me: *‘But the soul is already free, floating on a sea of light.’*

“At that time I was trying to remember where these lines came from, but I could not remember; judging by the rhythm, the words must be a part of some poem, which, however, entirely escaped my memory. Later when the verse repeatedly came to my mind, I asked many people about it without receiving any information.

“Last year I crossed the same bridge on my return journey from Spain. It was a very dark night and it rained. I looked through the window to ascertain whether we had already reached the frontier station and noticed that we were on the Bidassao bridge. Immediately the above-cited verse returned to my memory and again I could not recall its origin.

“At home many months later I found Uhland’s poems. I opened the volume and my glance fell upon the verse: *‘But the soul is already free,*

floating on a sea of light,' which were the concluding lines of the poem entitled 'The Pilgrim.' I read the poem and dimly recalled that I had known it many years ago. The scene of action is in Spain, and this seemed to me to be the only relation between the quoted verse and the place on the railroad journey described by me. I was only half satisfied with my discovery and mechanically continued to turn the pages of the book. On turning the next page I found a poem the title of which was *'Bidassao Bridge.'*

"I may add that the contents of this poem seemed even stranger to me than that of the first, and that its first verse read:

"'On the Bidassao bridge stands a saint grey with age, he blesses to the right the Spanish mountain, to the left he blesses the French land.'"

II. This understanding of the determination of apparently arbitrarily selected names, numbers, and words may perhaps contribute to the solution of another problem. As is known, many persons argue against the assumption of an absolute psychic determinism by referring to an intense feeling of conviction that there is a free will. This feeling of conviction exists, but is not incompatible with the belief in determinism. Like all normal feelings, it must be justified by something. But, so far as I can observe, it does not manifest itself in weighty and important decisions; on these occasions one has much more the feeling of a psychic compulsion and gladly falls back upon it. (Compare Luther's "Here I stand, I cannot do anything else.")

On the other hand, it is in trivial and indifferent decisions that one feels sure that he could just as easily have acted differently, that he acted of his own free will, and without any motives. From our analyses we therefore need not contest the right of the feeling of conviction that there is a free will. If we distinguish conscious from unconscious motivation, we are then informed by the feeling of conviction that the conscious motivation does not extend over all our motor resolutions. *Minima non curat prætor.* What is thus left free from the one side receives its motive from the other side, from the unconscious, and the determinism in the psychic realm is thus carried out uninterruptedly. [8]

III. Although conscious thought must be altogether ignorant of the motivation of the faulty actions described above, yet it would be desirable to discover a psychologic proof of its existence; indeed, reasons obtained through a deeper knowledge of the unconscious make it probable that such

proofs are to be discovered somewhere. As a matter of fact phenomena can be demonstrated in two spheres which seem to correspond to an unconscious and hence to a displaced knowledge of these motives.

(*a*) It is a striking and generally to be recognized feature in the behaviour of paranoiacs, that they attach the greatest significance to the trivial details in the behaviour of others. Details which are usually overlooked by others they interpret and utilize as the basis of far-reaching conclusions. For example, the last paranoiac seen by me concluded that there was a general understanding among people of his environment, because at his departure from the railway-station they made a certain motion with one hand. Another noticed how people walked on the street, how they brandished their walking-sticks, and the like. [9]

The category of the accidental, requiring no motivation, which the normal person lets pass as a part of his own psychic activities and faulty actions, is thus rejected by the paranoiac in the application to the psychic manifestations to others. All that he observes in others is full of meaning, all is explainable. But how does he come to look at it in this manner? Probably here as in so many other cases, he projects into the mental life of others what exists in his own unconscious activity. Many things obtrude themselves on consciousness in paranoia which in normal and neurotic persons can only be demonstrated through psychoanalysis as existing in their unconscious. [10] In a certain sense the paranoiac is here justified, he perceives something that escapes the normal person, he sees clearer than one of normal intellectual capacity, but his knowledge becomes worthless when he imputes to others the state of affairs he thus recognizes. I hope that I shall not be expected to justify every paranoic interpretation. But the point which we grant to paranoia in this conception of chance actions will facilitate for us the psychologic understanding of the conviction which the paranoiac attaches to all these interpretations. *There is certainly some truth to it;* even our errors of judgment, which are not designated as morbid, acquire their feeling of conviction in the same way. This feeling is justified for a certain part of the erroneous train of thought or for the source of its origin, and we shall later extend to it the remaining relationships.

(*b*) The phenomena of superstition furnish another indication of the unconscious motivation in chance and faulty actions. I will make myself

clear through the discussion of a simple experience which gave me the starting-point to these reflections.

Having returned from vacation, my thoughts immediately turned to the patients with whom I was to occupy myself in the beginning of my year's work. My first visit was to a very old woman (see above) for whom I had twice daily performed the same professional services for many years. Owing to this monotony unconscious thoughts have often found expression on the way to the patient and during my occupation with her. She was over ninety years old; it was therefore pertinent to ask oneself at the beginning of each year how much longer she was likely to live.

On the day of which I speak I was in a hurry and took a carriage to her house. Every coachman at the cabstand near my house knew the old woman's address, as each of them had often driven me there. This day it happened that the driver did not stop in front of her house, but before one of the same number in a nearby and really similar-looking parallel street. I noticed the mistake and reproached the coachman, who apologized for it.

Is it of any significance when I am taken to a house where the old woman is not to be found? Certainly not to me; but were I *superstitious,* I should see an omen in this incident, a hint of fate that this would be the last year for the old woman. A great many omens which have been preserved by history have been founded on no better symbolism. Of course, I explain the incident as an accident without further meaning.

The case would have been entirely different had I come on foot and, "absorbed in thought" or "through distraction," I had gone to the house in the parallel street instead of the correct one. I would not explain that as an accident, but as an action with unconscious intent requiring interpretation. My explanation of this "lapse in walking" would probably be that I expected that the time would soon come when I should not meet the old woman any longer.

I therefore differ from a superstitious person in the following manner: —

I do not believe that an occurrence in which my mental life takes no part can teach me anything hidden concerning the future shaping of reality; but I do believe that an unintentional manifestation of my own mental activity surely contains something concealed which belongs only to my mental life — that is, I believe in outer (real) chance, but not in inner (psychic) accidents. With the superstitious person the case is

reversed: he knows nothing of the motive of his chance and faulty actions, he believes in the existence of psychic contingencies; he is therefore inclined to attribute meaning to external chance, which manifests itself in actual occurrence, and to see in the accident a means of expression for something hidden outside of him. There are two differences between me and the superstitious person: first, he projects the motive to the outside, while I look for it in myself; second, he explains the accident by an event which I trace to a thought. What he considers hidden corresponds to the unconscious with me and the compulsion not to let chance pass as chance but to explain it as common to both of us.

Thus I admit that this conscious ignorance and unconscious knowledge of the motivation of psychic accidentalness is one of the psychic roots of superstition. *Because* the superstitious person knows nothing of the motivation of his own accidental actions, and because the fact of this motivation strives for a place in his recognition, he is compelled to dispose of them by displacing them into the outer world. If such a connection exists it can hardly be limited to this single case. As a matter of fact, I believe that a large portion of the mythological conception of the world which reaches far into the most modern religions *is nothing but psychology projected into the outer world.* The dim perception (the endo-psychic perception, as it were) of psychic factors and relations [11] of the unconscious was taken as a model in the construction of a *transcendental reality,* which is destined to be changed again by science into *psychology of the unconscious.*

It is difficult to express it in other terms; the analogy to paranoia must here come to our aid. We venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and the like — that is, to transform *metaphysics* into *meta-psychology.* The gap between the paranoiac's displacement and that of superstition is narrower than appears at first sight. When human beings began to think, they were obviously compelled to explain the outer world in an anthropomorphic sense by a multitude of personalities in their own image; the accidents which they explained superstitiously were thus actions and expressions of persons. In that regard they behaved just like paranoiacs, who draw conclusions from insignificant signs which others give them, and like all normal persons who justly take the unintentional actions of their fellow-beings as a basis for the estimation of their characters. Only in our modern

philosophical, but by no means finished, views of life does superstition seem so much out of place: in the view of life of prescientific times and nations it was justified and consistent.

The Roman who gave up an important undertaking because he sighted an ill-omened flock of birds was relatively right; his action was consistent with his principles. But if he withdrew from an undertaking because he had stumbled on his threshold (*un Romain retournerait*), he was absolutely superior even to us unbelievers. He was a better psychologist than we are striving to become. For his stumbling could demonstrate to him the existence of a doubt, an internal counter-current the force of which could weaken the power of his intention at the moment of its execution. For only by concentrating all psychic forces on the desired aim can one be assured of perfect success. How does Schiller's Tell, who hesitated so long to shoot the apple from his son's head, answer the bailiff's question why he had provided himself with a second arrow?

"With the second arrow I would have pierced you had I struck my dear child — and truly, I should not have failed to reach you."

IV. Whoever has had the opportunity of studying the concealed psychic feelings of persons by means of psychoanalysis can also tell something new concerning the quality of unconscious motives, which express themselves in superstition. Nervous persons afflicted with compulsive thinking and compulsive states, who are often very intelligent, show very plainly that superstition originates from repressed hostile and cruel impulses. The greater part of superstition signifies fear of impending evil, and he who has frequently wished evil to others, but because of a good bringing-up has repressed the same into the unconscious, will be particularly apt to expect punishment for such unconscious evil in the form of a misfortune threatening him from without.

If we concede that we have by no means exhausted the psychology of superstition in these remarks, we must, on the other hand, at least touch upon the question whether real roots of superstition should be altogether denied, whether there are really no omens, prophetic dreams, telepathic experiences, manifestations of supernatural forces, and the like. I am now far from willing to repudiate without anything further all these phenomena, concerning which we possess so many minute observations even from men of intellectual prominence, and which should certainly form a basis for further investigation. We may even hope that some of

these observations will be explained by our present knowledge of the unconscious psychic processes without necessitating radical changes in our present aspect. If still other phenomena, as, for example, those maintained by the spiritualists, should be proven, we should then consider the modification of our “laws” as demanded by the new experience, without becoming confused in regard to the relation of things of this world.

In the sphere of these analyses I can only answer the questions here proposed subjectively — that is, in accordance with my personal experience. I am sorry to confess that I belong to that class of unworthy individuals before whom the spirits cease their activities and the supernatural disappears, so that I have never been in position to experience anything personally that would stimulate belief in the miraculous. Like everybody else, I have had forebodings and experienced misfortunes; but the two evaded each other, so that nothing followed the foreboding, and the misfortune struck me unannounced. When as a young man I lived alone in a strange city I frequently heard my name suddenly pronounced by an unmistakable, dear voice, and I then made a note of the exact moment of the hallucination in order to inquire carefully of those at home what had occurred at that time. There was nothing to it. On the other hand, I later worked among my patients calmly and without foreboding while my child almost bled to death. Nor have I ever been able to recognize as unreal phenomena any of the forebodings reported to me by my patients.

The belief in prophetic dreams numbers many adherents, because it can be supported by the fact that some things really so happen in the future as they were previously foretold by the wish of the dream. But in this there is little to be wondered at, as many far-reaching deviations may be regularly demonstrated between a dream and the fulfilment which the credulity of the dreamer prefers to neglect.

A nice example, one which may be justly called prophetic, was once brought to me for exhaustive analysis by an intelligent and truth-loving patient. She related that she once dreamed that she had met a former friend and family physician in front of a certain store in a certain street, and next morning when she went downtown she actually met him at the place named in the dream. I may observe that the significance of this wonderful coincidence was not proven to be due to any subsequent event — that is, it could not be justified through future occurrences.

Careful examination definitely established the fact that there was no proof that the woman recalled the dream in the morning following the night of the dream — that is, before the walk and before the meeting. She could offer no objection when this state of affairs was presented in a manner that robbed this episode of everything miraculous, leaving only an interesting psychologic problem. One morning she had walked through this very street, had met her old family physician before that certain store, and on seeing him received the conviction that during the preceding night she had dreamed of this meeting at this place.

The analysis then showed with great probability how she came to this conviction, to which, in accordance with the general rule, we cannot deny a certain right to credence. A meeting at a definite place following a previous expectation really describes the fact of a rendezvous. The old family physician awakened her memory of old times, when meetings with a third person, also a friend of the physician, were of marked significance to her. Since that time she had continued her relations with this gentleman, and the day before the mentioned dream she had waited for him in vain. If I could report in greater detail the circumstances here before us, I could easily show that the illusion of the prophetic dream at the sight of the friend of former times is perchance equivalent to the following speech: “Ah, doctor, you now remind me of bygone times, when I never had to wait in vain for N. when we had arranged a meeting.”

I have observed in myself a simple and easily explained example, which is probably a good model for similar occurrences of those familiar “remarkable coincidences” wherein we meet a person of whom we were just thinking. During a walk through the inner city a few days after the title of “Professor” was bestowed on me, which carries with it a great deal of prestige even in monarchical cities, my thoughts suddenly merged into a childish revenge-fantasy against a certain married couple. Some months previous they had called me to see their little daughter who suffered from an interesting compulsive manifestation following the appearance of a dream. I took a great interest in the case, the genesis of which I believed I could surmise, but the parents were unfavourable to my treatment, and gave me to understand that they thought of applying to a foreign authority who cured by means of hypnotism. I now fancied that after the failure of this attempt, the parents begged me to resume my treatment, that they now had full confidence in me, etc. But I answered: “Now that I have become a

professor, you have confidence in me. The title has made no change in my ability; if you could not use me when I was instructor you can get along without me now that I am a professor." At this point my fantasy was interrupted by a loud "Good evening, Professor!" and as I looked up there passed me the same couple on whom I had just taken this imaginary vengeance.

The next reflection destroyed the semblance of the miraculous. I was walking towards this couple on a straight, almost deserted street; glancing up hastily at a distance of perhaps twenty steps from me, I had spied and realized their stately personalities; but this perception, following the model of a negative hallucination, was set aside by certain emotionally accentuated motives and then asserted itself in the apparently spontaneous emerging fantasy.

A similar experience is related by Brill, which also throws some light on the nature of telepathy.

"While engrossed in conversation during our customary Sunday evening dinner at one of the large New York restaurants, I suddenly stopped and irrelevantly remarked to my wife, 'I wonder how Dr. R. is doing in Pittsburg.' She looked at me much astonished and said: 'Why, that is exactly what I have been thinking for the last few seconds! Either you have transferred this thought to me or I have transferred it to you. How can you otherwise explain this strange phenomenon?' I had to admit that I could offer no solution. Our conversation throughout the dinner showed not the remotest association to Dr. R., nor, so far as our memories went, had we heard or spoken of him for some time. Being a sceptic, I refused to admit that there was anything mysterious about it, although inwardly I felt quite uncertain. To be frank, I was somewhat mystified.

"But we did not remain very long in this state of mind, for on looking toward the cloak-room we were surprised to see Dr. R. Though closer inspection showed our mistake, we were both struck by the remarkable resemblance of this stranger to Dr. R. From the position of the cloak-room we were forced to conclude that this stranger had passed our table. Absorbed in our conversation, we had not noticed him consciously, but the visual image had stirred up the association of his double, Dr. R. That we should both have experienced the same thought is also quite natural. The last word from our friend was to the effect that he had taken up private

practice in Pittsburg, and, being aware of the vicissitudes that beset the beginner, it was quite natural to wonder how fortune smiled upon him.

"What promised to be a supernatural manifestation was thus easily explained on a normal basis; but had we not noticed the stranger before he left the restaurant, it would have been impossible to exclude the mysterious. I venture to say that such simple mechanisms are at the bottom of the most complicated telepathic manifestations; at least, such has been my experience in all cases accessible to investigation."

Another "solution of an apparent foreboding" was reported by Otto Rank: — [12]

"Some time ago I had experienced a remarkable variation of that 'peculiar coincidence' wherein one meets a person who has just been occupying one's thoughts. Shortly before Christmas I went to the Austro-Hungarian Bank in order to obtain ten new silver crown-pieces destined for Christmas gifts. Absorbed in ambitious fantasies which dealt with the contrast of my meagre means to the enormous sums in the banking-house, I turned into the narrow street to the bank. In front of the door I saw an automobile and many people going in and out. I thought to myself: 'The officials will have plenty of time for my new crowns; naturally I shall be quick about it; I shall put down the paper notes to be exchanged, and say, "Please give me gold."' I realized my mistake at once — I was to have asked for *silver* — and awoke from my fantasies.

"I was now only a few steps from the entrance, and noticed a young man coming toward me who looked familiar, but whom I could not definitely identify on account of my short-sightedness. As he came nearer I recognized him as a classmate of my brother whose name was *Gold* and from whose brother, a well-known journalist, I had great expectations in the beginning of my literary career. But these expectations had not materialized, and with them had vanished the hoped-for material success with which my fantasies were occupying themselves on my way to the bank. Thus engrossed I must have unconsciously perceived the approach of Mr. Gold, who impressed himself on my conscience while I was dreaming of material success, and thereby caused me to ask the cashier for gold instead of the inferior silver. But, on the other hand, the paradoxical fact that my unconscious was able to perceive an object long before it was recognized by the eye might in part be explained by the complex readiness (*Komplexbereitschaft*) of Bleuler. For my mind was attuned to the

material, and, contrary to my better knowledge, it guided my steps from the very beginning to buildings where gold and paper money were exchanged."

To the category of the wonderful and uncanny we may also add that strange feeling we perceive in certain moments and situations when it seems as if we had already had exactly the same experience, or had previously found ourselves in the same situation. Yet we are never successful in our efforts to recall clearly those former experiences and situations. I know that I follow only the loose colloquial expression when I designate that which stimulates us in such moments as a "feeling." We undoubtedly deal with a judgment, and, indeed, with a judgment of cognition; but these cases, nevertheless, have a character peculiar to themselves, and besides, we must not ignore the fact that we never recall what we are seeking.

I do not know whether this phenomenon of *Déjà vu* was ever seriously offered as a proof of a former psychic existence of the individual; but it is certain that psychologists have taken an interest in it, and have attempted to solve the riddle in a multitude of speculative ways. None of the proposed tentative explanations seems right to me, because none takes account of anything but the accompanying manifestations and the favouring conditions of the phenomenon. Those psychic processes which, according to my observation, are alone responsible for the explanation of the *Déjà vu* — namely, the unconscious fantasies — are generally neglected by the psychologists even to-day.

I believe that it is wrong to designate the feeling of having experienced something before as an illusion. On the contrary, in such moments something is really touched that we have already experienced, only we cannot consciously recall the latter because it never was conscious. In short, the feeling of *Déjà vu* corresponds to the memory of an unconscious fantasy. There are unconscious fantasies (or day dreams) just as there are similar conscious creations, which every one knows from personal experience.

I realize that the object is worthy of most minute study, but I will here give the analysis of only one case of *Déjà vu* in which the feeling was characterized by particular intensity and persistence. A woman of thirty-seven years asserted that she most distinctly remembered that at the age of twelve and a half she paid her first visit to some school friends in the

country, and as she entered the garden she immediately had the feeling of having been there before. This feeling was repeated as she went through the living-rooms, so that she believed she knew beforehand how big the next room was, what views one could have on looking out of it, etc. But the belief that this feeling of recognition might have its source in a previous visit to the house and garden, perhaps a visit paid in earliest childhood, was absolutely excluded and disproved by statements from her parents. The woman who related this sought no psychologic explanation, but saw in the appearance of this feeling a prophetic reference to the importance which these friends later assumed in her emotional life. On taking into consideration, however, the circumstance under which this phenomenon presented itself to her, we found the way to another conception.

When she decided upon this visit she knew that these girls had an only brother, who was seriously ill. In the course of the visit she actually saw him. She found him looking very badly, and thought to herself that he would soon die. But it happened that her own only brother had had a serious attack of diphtheria some months before, and during his illness she had lived for weeks with relatives far from her parental home. She believed that her brother was taking part in this visit to the country, imagined even that this was his first long journey since his illness; still, her memory was remarkably indistinct in regard to these points, whereas all other details, and particularly the dress which she wore that day, remained most clearly before her eyes.

To the initiated it will not be difficult to conclude from these suggestions that the expectation of her brother’s death had played a great part in the girl’s mind at that time, and that either it never became conscious or it was more energetically repressed after the favourable issue of the illness. Under other circumstances she would have been compelled to wear another dress — namely, mourning clothes. She found the analogous situation in her friends’ home; their only brother was in danger of an early death, an event that really came to pass a short time after. She might have consciously remembered that she had lived through a similar situation a few months previous, but instead of recalling what was inhibited through repression she transferred the memory feeling to the locality, to the garden, and the house, and merged it into the *fausse reconnaissance* that she had already seen everything exactly as it was.

From the fact of the repression we may conclude that the former expectation of the death of her brother was not far from evincing the character of a wish-fantasy. She would then have become the only child. In her later neurosis she suffered in the most intense manner from the fear of losing her parents, behind which the analysis disclosed, as usual, the unconscious wish of the same content.

My own experience of *Déjà vu* I can trace in a similar manner to the emotional constellation of the moment. It may be expressed as follows: “That would be another occasion for awakening certain fantasies (unconscious and unknown) which were formed in me at one time or another as a wish to improve my situation.” [13]

V. Recently when I had occasion to recite to a colleague of a philosophical turn of mind some examples of name-forgetting, with their analyses, he hastened to reply: “That is all very well, but with me the forgetting of a name proceeds in a different manner.” Evidently one cannot dismiss this question as simply as that; I do not believe that my colleague had ever thought of an analysis for the forgetting of a name, nor could he say how the process differed in him. But his remark, nevertheless, touches upon a problem which many would be inclined to place in the foreground. Does the solution given for faulty and chance actions apply in general or only in particular cases, and if only in the latter, what are the conditions under which it may also be employed in the explanation of the other phenomena?

In answer to this question my experiences leave me in the lurch. I can only urge against considering the demonstrated connections as rare, for as often as I have made the test in myself and with my patients it was always definitely demonstrated exactly as in the examples reported, or there were at least good reasons to assume this. One should not be surprised, however, when one does not succeed every time in finding the concealed meaning of the symptomatic action, as the amount of inner resistances ranging themselves against the solution must be considered a deciding factor. Also it is not always possible to explain every individual dream of one’s self or of patients. To substantiate the general validity of the theory, it is enough if one can penetrate only a certain distance into the hidden associations. The dream which proves refractory when the solution is attempted on the following day can often be robbed of its secret a week or a month later, when the psychic factors combating one another have been reduced as a

consequence of a real change that has meanwhile taken place. The same applies to the solution of faulty and symptomatic actions. It would therefore be wrong to affirm of all cases which resist analysis that they are caused by another psychic mechanism than that here revealed; such assumption requires more than negative proofs; moreover, the readiness to believe in a different explanation of faulty and symptomatic actions, which probably exists universally in all normal persons, does not prove anything; it is obviously an expression of the same psychic forces which produced the secret, which therefore strives to protect and struggle against its elucidation.

On the other hand, we must not overlook the fact that the repressed thoughts and feelings are not independent in attaining expression in symptomatic and faulty actions. The technical possibility for such an adjustment of the innervations must be furnished independently of them, and this is then gladly utilized by the intention of the repressed material to come to conscious expression. In the case of linguistic faulty actions an attempt has been made by philosophers and philologists to verify through minute observations what structural and functional relations enter into the service of such intention. If in the determinations of faulty and symptomatic actions we separate the unconscious motive from its co-active physiological and psychophysical relations, the question remains open whether there are still other factors within normal limits which, like the unconscious motive, and in its place can produce faulty and symptomatic actions on the road of the relations. It is not my task to answer this question.

VI. Since the discussion of speech blunders we have been content to demonstrate that faulty actions have a concealed motive, and through the aid of psychoanalysis we have traced our way to the knowledge of their motivation. The general nature and the peculiarities of the psychic factors brought to expression in these faulty actions we have hitherto left almost without consideration; at any rate, we have not attempted to define them more accurately or to examine into their lawfulness. Nor will we now attempt a thorough elucidation of the subject, as the first steps have already taught us that it is more feasible to enter this structure from another side. Here we can put before ourselves certain questions which I will cite in their order. (1) What is the content and the origin of the thoughts and feelings which show themselves through faulty and chance

actions? (2) What are the conditions which force a thought or a feeling to make use of these occurrences as a means of expression and place it in a position to do so? (3) Can constant and definite associations be demonstrated between the manner of the faulty action and the qualities brought to expression through it?

I shall begin by bringing together some material for answering the last question. In the discussion of the examples of speech blunders we found it necessary to go beyond the contents of the intended speech, and we had to seek the cause of the speech disturbance outside the intention. The latter was quite clear in a series of cases, and was known to the consciousness of the speaker. In the example that seemed most simple and transparent it was a similar sounding but different conception of the same thought, which disturbed its expression without any one being able to say why the one succumbed and the other came to the surface (Meringer and Mayers' *Contaminations*).

In a second group of cases one conception succumbed to a motive which did not, however, prove strong enough to cause complete submersion. The conception which was withheld was clearly presented to consciousness.

Only of the third group can we affirm unreservedly that the disturbing thought differed from the one intended, and it is obvious that it may establish an essential distinction. The disturbing thought is either connected with the disturbed one through a thought association (disturbance through inner contradiction), or it is substantially strange to it, and just the disturbed word is connected with the disturbing thought through a surprising outer association, which is frequently unconscious.

In the examples which I have given from my psychoanalyses it is found that the entire speech is either under the influence of thoughts which have become active simultaneously, or under absolutely unconscious thoughts which betray themselves either through the disturbance itself, or which evince an indirect influence by making it possible for the individual parts of the unconsciously intended speech to disturb one another. The retained or unconscious thoughts from which the disturbances in speech emanate are of most varied origin. A general survey does not reveal any definite direction.

Comparative examinations of examples of mistakes in reading and writing lead to the same conclusions. Isolated cases, as in speech blunders,

seem to owe their origin to an unmotivated work of condensation (*e.g.*, the *Apel*). But we should be pleased to know whether special conditions must not be fulfilled in order that such condensation, which is considered regular in the dream-work and faulty in our waking thoughts, should take place. No information concerning this can be obtained from the examples themselves. But I merely refuse from this to draw the conclusion that there are no such conditions, as, for instance, the relaxation of conscious attention; for I have learned elsewhere that automatic actions are especially characterized by correctness and reliability. I would rather emphasize the fact that here, as so frequently in biology, it is the normal relations, or those approaching the normal, that are less favourable objects for investigation than the pathological. What remains obscure in the explanation of these most simple disturbances will, according to my expectation, be made clear through the explanation of more serious disturbances.

Also mistakes in reading and writing do not lack examples in which more remote and more complicated motivation can be recognized.

There is no doubt that the disturbances of the speech functions occur more easily and make less demand on the disturbing forces than other psychic acts.

But one is on different ground when it comes to the examination of forgetting in the literal sense — *i.e.*, the forgetting of past experiences. (To distinguish this forgetting from the others we designate *sensu strictiori* the forgetting of proper names and foreign words, as in Chapters I and II, as "slips"; and the forgetting of resolutions as "omissions.") The principal conditions of the normal process in forgetting are unknown. [14] We are also reminded of the fact that not all is forgotten which we believe to be. Our explanation here deals only with those cases in which the forgetting arouses our astonishment, in so far as it infringes the rule that the unimportant is forgotten, while the important matter is guarded by memory. Analysis of these examples of forgetting which seem to demand a special explanation shows that the motive of forgetting is always an unwillingness to recall something which may evoke painful feelings. We come to the conjecture that this motive universally strives for expression in psychic life, but is inhibited through other and contrary forces from regularly manifesting itself. The extent and significance of this dislike to recall painful impressions seems worthy of the most painstaking

psychologic investigation. The question as to what special conditions render possible the universally resistant forgetting in individual cases cannot be solved through this added association.

A different factor steps into the foreground in the forgetting of resolutions; the supposed conflict resulting in the repression of the painful memory becomes tangible, and in the analysis of the examples one regularly recognizes a counter-will which opposes but does not put an end to the resolution. As in previously discussed faulty acts, we here also recognize two types of the psychic process: the counter-will either turns directly against the resolution (in intentions of some consequence) or it is substantially foreign to the resolution itself and establishes its connection with it through an outer association (in almost indifferent resolutions).

The same conflict governs the phenomena of erroneously carried-out actions. The impulse which manifests itself in the disturbances of the action is frequently a counter-impulse. Still oftener it is altogether a strange impulse which only utilizes the opportunity to express itself through a disturbance in the execution of the action. The cases in which the disturbance is the result of an inner contradiction are the most significant ones, and also deal with the more important activities.

The inner conflict in the chance or symptomatic actions then merges into the background. Those motor expressions which are least thought of, or are entirely overlooked by consciousness, serve as the expression of numerous unconscious or restrained feelings. For the most part they represent symbolically wishes and phantoms.

The first question (as to the origin of the thoughts and emotions which find expression in faulty actions) we can answer by saying that in a series of cases the origin of the disturbing thoughts can be readily traced to repressed emotions of the psychic life. Even in healthy persons egotistic, jealous and hostile feelings and impulses, burdened by the pressure of moral education, often utilize the path of faulty actions to express in some way their undeniably existing force which is not recognized by the higher psychic instances. Allowing these faulty and chance actions to continue corresponds in great part to a comfortable toleration of the unmoral. The manifold sexual currents play no insignificant part in these repressed feelings. That they appear so seldom in the thoughts revealed by the analyses of my examples is simply a matter of coincidence. As I have undertaken the analyses of numerous examples from my own psychic life,

the selection was partial from the first, and aimed at the exclusion of sexual matters. At other times it seemed that the disturbing thoughts originated from the most harmless objection and consideration.

We have now reached the answer to the second question — that is, what psychologic conditions are responsible for the fact that a thought must seek expression, not in its complete form but, as it were, in parasitic form, as a modification and disturbance of another. From the most striking examples of faulty actions it is quite obvious that this determinant should be sought in a relation to conscious capacity, or in the more or less firmly pronounced character of the “repressed” material. But an examination of this series of examples shows that this character consists of many indistinct elements. The tendency to overlook something because it is wearisome, or because the concerned thought does not really belong to the intended matter — these feelings seem to play the same rôle as motives for the suppression of a thought (which later depends for expression on the disturbance of another), as the moral condemnation of a rebellious emotional feeling, or as the origin of absolutely unconscious trains of thought. An insight into the general nature of the condition of faulty and chance actions cannot be gained in this way.

However, this investigation gives us one single significant fact; the more harmless the motivation of the faulty act the less obnoxious, and hence the less incapable of consciousness, the thought to which it gives expression is; the easier also becomes the solution of the phenomenon after we have turned our attention toward it. The simplest cases of speech blunders are immediately noticed and spontaneously corrected. Where one deals with motivation through actually repressed feelings the solution requires a painstaking analysis, which may sometimes strike against difficulties or turn out unsuccessful.

One is therefore justified in taking the result of this last investigation as an indication of the fact that the satisfactory explanation of the psychologic determinations of faulty and chance actions is to be acquired in another way and from another source. The indulgent reader can therefore see in these discussions the demonstration of the surfaces of fracture in which this theme was quite artificially evolved from a broader connection.

VII. Just a few words to indicate the direction of this broader connection. The mechanism of the faulty and chance actions, as we have

learned to know it through the application of analysis, shows in the most essential points an agreement with the mechanism of dream formation, which I have discussed in the chapter “The Dream-Work” of my book on the interpretation of dreams. Here, as there, one finds the condensation and compromise formation (“contaminations”); in addition the situation is much the same, since unconscious thoughts find expression as modifications of other thoughts in unusual ways and through outer associations. The incongruities, absurdities, and errors in the dream content by virtue of which the dream is scarcely recognized as a psychic achievement originate in the same way — to be sure, through freer usage of the existing material — as the common error of our everyday life; *here, as there, the appearance of the incorrect function is explained through the peculiar interference of two or more correct actions.*

An important conclusion can be drawn from this combination: the peculiar mode of operation, whose most striking function we recognize in the dream content, should not be adjudged only to the sleeping state of the psychic life when we possess abundant proof of its activity during the waking state in the form of faulty actions. The same connection also forbids us assuming that these psychic processes which impress us as abnormal and strange are determined by deep-seated decay of psychic activity or by morbid state of function. [15]

The correct understanding of this strange psychic work which allows the faulty actions to originate like the dream pictures will only be possible after we have discovered that the psychoneurotic symptoms, particularly the psychic formations of hysteria and compulsion neurosis, repeat in their mechanisms all the essential features of this mode of operation. The continuation of our investigation would therefore have to begin at this point.

There is still another special interest for us in considering the faulty, chance, and symptomatic actions in the light of this last analogy. If we compare them to the function of the psychoneuroses and the neurotic symptoms, two frequently recurring statements gain in sense and support — namely, that the border-line between the nervous, normal, and abnormal states is indistinct, and that we are all slightly nervous. Regardless of all medical experience, one may construe various types of such barely suggested nervousness, the *formes frustes* of the neuroses. There may be cases in which only a few symptoms appear, or they may manifest

themselves rarely or in mild forms; the extenuation may be transferred to the number, intensity, or to the temporal outbreak of the morbid manifestation. It may also happen that just this type, which forms the most frequent transition between health and disease, may never be discovered. The transition type, whose morbid manifestations come in the form of faulty and symptomatic actions, is characterized by the fact that the symptoms are transformed to the least important psychic activities, while everything that can lay claim to a higher psychic value remains free from disturbance. When the symptoms are disposed of in a reverse manner — that is, when they appear in the most important individual and social activities in a manner to disturb the functions of nourishment and sexual relations, professional and social life — such disposition is found in the severe cases of neuroses, and is perhaps more characteristic of the latter than the multiformity or vividness of the morbid manifestations.

But the common character of the mildest as well as the severest cases, to which the faulty and chance actions contribute, lies *in the ability to refer the phenomena to unwelcome, repressed, psychic material, which, though pushed away from consciousness, is nevertheless not robbed of all capacity to express itself.*

ENDNOTES.

[2] As an explanation of *Macbeth,* No. 17 of the U. L., I was informed by Dr. Adler that in his seventeenth year this man had joined an anarchistic society whose aim was regicide. Probably this is why he forgot the content of the play *Macbeth.* The same person invented at that time a secret code in which numbers substituted letters.

[3] For the sake of simplicity I have omitted some of the not less suitable thoughts of the patients.

[4] *Loc. cit.,* p. 36.

[5] "Ein Beitrag zur Kenntnis des Zahlentraumes," *Zentralb. f. Psychoanalyse,* i. 12.

[6] "Unconscious Manipulation of Numbers" (*ibid.,* ii. 5, 1912).

[7] This is another excellent example showing how a conscious intention was powerless to counteract an unconscious resistance.

[8] These conceptions of strict determinism in seemingly arbitrary actions have already borne rich fruit for psychology — perhaps also for the administration of justice. Bleuler and Jung have in this way made intelligible the reaction in the so-called association experiments, wherein the test person answers to a given word with one occurring to him (stimulus-word reaction), while the time elapsing between the stimulus word and answer is measured (reaction-time). Jung has shown in his *Diagnostische Assoziationsstudien*, 1906, what fine reagents for psychic occurrences we possess in this association-experiment. Three students of criminology, H. Gross, of Prague, and Wertheimer and Klein, have developed from these experiments a technique for the diagnosis of facts (*Tatbestands-Diagnostik*) in criminal cases, the examination of which is now tested by psychologists and jurists.

[9] Proceeding from other points of view, this interpretation of the trivial and accidental by the patient has been designated as “delusions of reference.”

[10] For example, the fantasies of the hysterical regarding sexual and cruel abuse which are made conscious by analysis often correspond in every detail with the complaints of persecuted paranoiacs. It is remarkable but not altogether unexpected that we also meet the identical content as reality in the contrivances of perverts for the gratification of their desires.

[11] Which naturally has nothing of the character of perception.

[12] *Zentralb. f. Psychoanalyse*, ii. 5.

[13] Thus far this explanation of *Déjà vu* has been appreciated by only one observer. Dr. Ferençzi, to whom the third edition of this book is indebted for so many contributions, writes to me concerning this: “I have been convinced, through myself as well as others, that the inexplicable feeling of familiarity can be referred to unconscious fantasies of which we are unconsciously reminded in an actual situation. With one of my patients the process was apparently different but in reality it was quite analogous. This feeling returned to him very often, but showed itself regularly as originating in a forgotten (repressed) portion of a dream of the preceding night. Thus it appears that the *Déjà vu* can originate not only from day dreams but also from night dreams.”

[14] I can perhaps give the following outline concerning the mechanism of actual forgetting. The memory material succumbs in general to two influences, condensation and disfigurement. Disfigurement is the work of the tendencies dominating the psychic life, and directs itself above all against the affective remnants of memory traces which maintain a more resistive attitude towards condensation. The traces which have grown indifferent merge into a process of condensation without opposition; in addition it may be observed that tendencies of disfigurement also feed on the indifferent material, because they have not been gratified where they wished to manifest themselves. As these processes of condensation and disfigurement continue for long periods during which all fresh experiences act upon the transformation of the memory content, it is our belief that it is time that makes memory uncertain and indistinct. It is quite probable that in forgetting there can really be no question of a direct function of time. From the repressed memory traces it can be verified that they suffer no changes even in the longest periods. The

unconscious, at all events, knows no time limit. The most important as well as the most peculiar character of psychic fixation consists in the fact that all impressions are on the one hand retained in the same form as they were received, and also in the forms that they have assumed in their further development. This state of affairs cannot be elucidated by any comparison from any other sphere. By virtue of this theory every former state of the memory content may thus be restored, even though all original relations have long been replaced by newer ones.

[15] I can perhaps give the following outline concerning the mechanism of actual forgetting. The memory material succumbs in general to two influences, condensation and disfigurement. Disfigurement is the work of the tendencies dominating the psychic life, and directs itself above all against the affective remnants of memory traces which maintain a more resistive attitude towards condensation. The traces which have grown indifferent merge into a process of condensation without opposition; in addition it may be observed that tendencies of disfigurement also feed on the indifferent material, because they have not been gratified where they wished to manifest themselves. This state of affairs cannot be elucidated by any comparison from any other sphere. By virtue of this theory every former state of the memory content may thus be restored, even though all original relations have long been replaced by newer ones.

THREE ESSAYS ON THE THEORY OF SEXUALITY

Translated by A. A. Brill

THIRD EDITION TEXT.

This 1905 work advances Freud's theory of sexuality, in particular its relation to childhood. The book explores three main areas: sexual perversions; childhood sexuality; and puberty. Freud began work on his first essay, *The Sexual Aberrations*, by distinguishing between the sexual object and the sexual aim — noting that deviations from the norm could occur with respect to both. The sexual object is therein defined as a desired object, and the sexual aim as what acts are desired with said object. Discussing the choice of children and animals as sex objects — paedophilia and bestiality — he notes that most people would prefer to limit these perversions to the insane "on aesthetic grounds", but that they exist in 'normal' people too. He also explores deviations of sexual aims, as in the tendency to linger over preparatory sexual aspects such as looking and touching.

Turning to neurotics, Freud emphasises that "in them tendencies to every kind of perversion can be shown to exist as unconscious forces...neurosis is, as it were, the negative of perversion". Freud also argues that people that are behaviourally abnormal are always sexually abnormal in his experience, but that many people who are normal behaviourally otherwise are sexually abnormal also.

The second essay in the collection, *Infantile Sexuality*, argues that children have sexual urges, from which adult sexuality only gradually emerges via psychosexual development. In regard to children, Freud identifies many forms of infantile sexual emotions, including thumb sucking, autoeroticism and sibling rivalry.

The third and final essay, *The Transformations of Puberty* formalises the distinction between the 'fore-pleasures' of infantile sexuality and the 'end-pleasure' of sexual intercourse. Freud also demonstrates how the adolescent years consolidate sexual identity under the dominance of the

genitals. In the final version of the text, *Three Essays on the Theory of Sexuality* also includes the concepts of penis envy, castration anxiety and the Oedipus complex.

INTRODUCTION TO TRANSLATION

The somewhat famous “Three Essays,” which Dr. Brill is here bringing to the attention of an English-reading public, occupy — brief as they are — an important position among the achievements of their author, a great investigator and pioneer in an important line. It is not claimed that the facts here gathered are altogether new. The subject of the sexual instinct and its aberrations has long been before the scientific world and the names of many effective toilers in this vast field are known to every student. When one passes beyond the strict domains of science and considers what is reported of the sexual life in folkways and art-lore and the history of primitive culture and in romance, the sources of information are immense. Freud has made considerable additions to this stock of knowledge, but he has done also something of far greater consequence than this. He has worked out, with incredible penetration, the part which this instinct plays in every phase of human life and in the development of human character, and has been able to establish on a firm footing the remarkable thesis that psychoneurotic illnesses never occur with a perfectly normal sexual life. Other sorts of emotions contribute to the result, but some aberration of the sexual life is always present, as the cause of especially insistent emotions and repressions.

The instincts with which every child is born furnish desires or cravings which must be dealt with in some fashion. They may be refined (“sublimated”), so far as is necessary and desirable, into energies of other sorts — as happens readily with the play-instinct — or they may remain as the source of perversions and inversions, and of cravings of new sorts substituted for those of the more primitive kinds under the pressure of a conventional civilization. The symptoms of the functional psychoneuroses represent, after a fashion, some of these distorted attempts to find a substitute for the imperative cravings born of the sexual instincts, and their form often depends, in part at least, on the peculiarities of the sexual life in infancy and early childhood. It is Freud’s service to have investigated this inadequately chronicled period of existence with extraordinary acumen. In so doing he made it plain that the “perversions” and “inversions,” which reappear later under such striking shapes, belong

to the normal sexual life of the young child and are seen, in veiled forms, in almost every case of nervous illness.

It cannot too often be repeated that these discoveries represent no fanciful deductions, but are the outcome of rigidly careful observations which any one who will sufficiently prepare himself can verify. Critics fret over the amount of "sexuality" that Freud finds evidence of in the histories of his patients, and assume that he puts it there. But such criticisms are evidences of misunderstandings and proofs of ignorance.

Freud had learned that the amnesias of hypnosis and of hysteria were not absolute but relative and that in covering the lost memories, much more, of unexpected sort, was often found. Others, too, had gone as far as this, and stopped. But this investigator determined that nothing but the absolute impossibility of going further should make him cease from urging his patients into an inexorable scrutiny of the unconscious regions of their memories and thoughts, such as never had been made before. Every species of forgetfulness, even the forgetfulness of childhood's years, was made to yield its hidden stores of knowledge; dreams, even though apparently absurd, were found to be interpreters of a varied class of thoughts, active, although repressed as out of harmony with the selected life of consciousness; layer after layer, new sets of motives underlying motives were laid bare, and each patient's interest was strongly enlisted in the task of learning to know himself in order more truly and wisely to "sublimate" himself. Gradually other workers joined patiently in this laborious undertaking, which now stands, for those who have taken pains to comprehend it, as by far the most important movement in psychopathology.

It must, however, be recognized that these essays, of which Dr. Brill has given a translation that cannot but be timely, concern a subject which is not only important but unpopular. Few physicians read the works of v. Krafft-Ebing, Magnus Hirschfeld, Moll, and others of like sort. The remarkable volumes of Havelock Ellis were refused publication in his native England. The sentiments which inspired this hostile attitude towards the study of the sexual life are still active, though growing steadily less common. One may easily believe that if the facts which Freud's truth-seeking researches forced him to recognize and to publish had not been of an unpopular sort, his rich and abundant contributions to observational psychology, to the significance of dreams, to the etiology

and therapeutics of the psychoneuroses, to the interpretation of mythology, would have won for him, by universal acclaim, the same recognition among all physicians that he has received from a rapidly increasing band of followers and colleagues.

May Dr. Brill's translation help toward this end.

There are two further points on which some comments should be made. The first is this, that those who conscientiously desire to learn all that they can from Freud's remarkable contributions should not be content to read any one of them alone. His various publications, such as "The Selected Papers on Hysteria and Other Psychoneuroses," "The Interpretation of Dreams," "The Psychopathology of Everyday Life," "Wit and its Relation to the Unconscious," the analysis of the case of the little boy called Hans, the study of Leonardo da Vinci, and the various short essays in the four Sammlungen kleiner Schriften, not only all hang together, but supplement each other to a remarkable extent. Unless a course of study such as this is undertaken many critics may think various statements and inferences in this volume to be far fetched or find them too obscure for comprehension.

The other point is the following: One frequently hears the psychoanalytic method referred to as if it was customary for those practicing it to exploit the sexual experiences of their patients and nothing more, and the insistence on the details of the sexual life, presented in this book, is likely to emphasize that notion. But the fact is, as every thoughtful inquirer is aware, that the whole progress of civilization, whether in the individual or the race, consists largely in a "sublimation" of infantile instincts, and especially certain portions of the sexual instinct, to other ends than those which they seemed designed to serve. Art and poetry are fed on this fuel and the evolution of character and mental force is largely of the same origin. All the forms which this sublimation, or the abortive attempts at sublimation, may take in any given case, should come out in the course of a thorough psychoanalysis. It is not the sexual life alone, but every interest and every motive, that must be inquired into by the physician who is seeking to obtain all the data about the patient, necessary for his reeducation and his cure. But all the thoughts and emotions and desires and motives which appear in the man or woman of adult years were once crudely represented in the obscure instincts of the infant, and among these instincts those which were concerned directly or

indirectly with the sexual emotions, in a wide sense, are certain to be found in every case to have been the most important for the end-result.

JAMES J. PUTNAM.

AUTHOR’S PREFACE TO THE SECOND EDITION

Although the author is fully aware of the gaps and obscurities contained in this small volume, he has, nevertheless, resisted a temptation to add to it the results obtained from the investigations of the last five years, fearing that thus its unified and documentary character would be destroyed. He accordingly reproduces the original text with but slight modifications, contenting himself with the addition of a few footnotes. For the rest, it is his ardent wish that this book may speedily become antiquated — to the end that the new material brought forward in it may be universally accepted, while the shortcomings it displays may give place to juster views.

VIENNA, December, 1909.

AUTHOR'S PREFACE TO THE THIRD EDITION

After watching for ten years the reception accorded to this book and the effect it has produced, I wish to provide the third edition of it with some prefatory remarks dealing with the misunderstandings of the book and the demands, insusceptible of fulfillment, made against it. Let me emphasize in the first place that whatever is here presented is derived entirely from every-day medical experience which is to be made more profound and scientifically important through the results of psychoanalytic investigation. The "Three Contributions to the Theory of Sex" can contain nothing except what psychoanalysis obliges them to accept or what it succeeds in corroborating. It is therefore excluded that they should ever be developed into a "theory of sex," and it is also quite intelligible that they will assume no attitude at all towards some important problems of the sexual life. This should not however give the impression that these omitted chapters of the great theme were unfamiliar to the author, or that they were neglected by him as something of secondary importance.

The dependence of this work on the psychoanalytic experiences which have determined the writing of it, shows itself not only in the selection but also in the arrangement of the material. A certain succession of stages was observed, the occasional factors are rendered prominent, the constitutional ones are left in the background, and the ontogenetic development receives greater consideration than the phylogenetic. For the occasional factors play the principal rôle in analysis, and are almost completely worked up in it, while the constitutional factors only become evident from behind as elements which have been made functional through experience, and a discussion of these would lead far beyond the working sphere of psychoanalysis.

A similar connection determines the relation between ontogenesis and phylogenesis. Ontogenesis may be considered as a repetition of phylogenesis insofar as the latter has not been varied by a more recent experience. The phylogenetic disposition makes itself visible behind the ontogenetic process. But fundamentally the constitution is really the precipitate of a former experience of the species to which the newer experience of the individual being is added as the sum of the occasional factors.

Beside its thoroughgoing dependence on psychoanalytic investigation I must emphasize as a character of this work of mine its intentional independence of biological investigation. I have carefully avoided the inclusion of the results of scientific investigation in general sex biology or of particular species of animals in this study of human sexual functions which is made possible by the technique of psychoanalysis. My aim was indeed to find out how much of the biology of the sexual life of man can be discovered by means of psychological investigation; I was able to point to additions and agreements which resulted from this examination, but I did not have to become confused if the psychoanalytic methods led in some points to views and results which deviated considerably from those merely based on biology.

I have added many passages in this edition, but I have abstained from calling attention to them, as in former editions, by special marks. The scientific work in our sphere has at present been retarded in its progress, nevertheless some supplements to this work were indispensable if it was to remain in touch with our newer psychoanalytic literature.

VIENNA, October, 1914.

I. THE SEXUAL ABERRATIONS

The fact of sexual need in man and animal is expressed in biology by the assumption of a “sexual impulse.” This impulse is made analogous to the impulse of taking nourishment, and to hunger. The sexual expression corresponding to hunger not being found colloquilly, science uses the expression “libido.”

Popular conception makes definite assumptions concerning the nature and qualities of this sexual impulse. It is supposed to be absent during childhood and to commence about the time of and in connection with the maturing process of puberty; it is supposed that it manifests itself in irresistible attractions exerted by one sex upon the other, and that its aim is sexual union or at least such actions as would lead to union.

But we have every reason to see in these assumptions a very untrustworthy picture of reality. On closer examination they are found to abound in errors, inaccuracies and hasty conclusions.

If we introduce two terms and call the person from whom the sexual attraction emanates the *sexual object*, and the action towards which the impulse strives the *sexual aim*, then the scientifically examined experience shows us many deviations in reference to both sexual object and sexual aim, the relations of which to the accepted standard require thorough investigation.

1. DEVIATION IN REFERENCE TO THE SEXUAL OBJECT

The popular theory of the sexual impulse corresponds closely to the poetic fable of dividing the person into two halves — man and woman — who strive to become reunited through love. It is therefore very surprising to hear that there are men for whom the sexual object is not woman but man, and that there are women for whom it is not man but woman. Such *persons* are called contrary sexuals, or better, inverts; the *condition*, that of inversion. The number of such individuals is considerable though difficult of accurate determination.

A. Inversion

The Behavior of Inverts. — The above-mentioned persons behave in many ways quite differently.

(*a*) They are absolutely inverted; *i.e.*, their sexual object must be always of the same sex, while the opposite sex can never be to them an object of sexual longing, but leaves them indifferent or may even evoke sexual repugnance. As men they are unable, on account of this repugnance, to perform the normal sexual act or miss all pleasure in its performance.

(*b*) They are amphigenously inverted (psychosexually hermaphroditic); *i.e.*, their sexual object may belong indifferently to either the same or to the other sex. The inversion lacks the character of exclusiveness.

(*c*) They are occasionally inverted; *i.e.*, under certain external conditions, chief among which are the inaccessibility of the normal sexual object and initiation, they are able to take as the sexual object a person of the same sex and thus find sexual gratification.

The inverted also manifest a manifold behavior in their judgment about the peculiarities of their sexual impulse. Some take the inversion as a matter of course, just as the normal person does regarding his libido, firmly demanding the same rights as the normal. Others, however, strive against the fact of their inversion and perceive in it a morbid compulsion.

Other variations concern the relations of time. The characteristics of the inversion in any individual may date back as far as his memory goes, or they may become manifest to him at a definite period before or after puberty. The character is either retained throughout life, or it occasionally recedes or represents an episode on the road to normal development. A periodical fluctuation between the normal and the inverted sexual object has also been observed. Of special interest are those cases in which the libido changes, taking on the character of inversion after a painful experience with the normal sexual object.

These different categories of variation generally exist independently of one another. In the most extreme cases it can regularly be assumed that the inversion has existed at all times and that the person feels contented with his peculiar state.

Many authors will hesitate to gather into a unit all the cases enumerated here and will prefer to emphasize the differences rather than the common

characters of these groups, a view which corresponds with their preferred judgment of inversions. But no matter what divisions may be set up, it cannot be overlooked that all transitions are abundantly met with, so that the formation of a series would seem to impose itself.

Conception of Inversion. — The first attention bestowed upon inversion gave rise to the conception that it was a congenital sign of nervous degeneration. This harmonized with the fact that doctors first met it among the nervous, or among persons giving such an impression. There are two elements which should be considered independently in this conception: the congenitality, and the degeneration.

Degeneration. — This term *degeneration* is open to the objections which may be urged against the promiscuous use of this word in general. It has in fact become customary to designate all morbid manifestations not of traumatic or infectious origin as degenerative. Indeed, Magnan's classification of degenerates makes it possible that the highest general configuration of nervous accomplishment need not exclude the application of the concept of degeneration. Under the circumstances, it is a question what use and what new content the judgment of "degeneration" still possesses. It would seem more appropriate not to speak of degeneration: (1) Where there are not many marked deviations from the normal; (2) where the capacity for working and living do not in general appear markedly impaired.

That the inverted are not degenerates in this qualified sense can be seen from the following facts:

1. The inversion is found among persons who otherwise show no marked deviation from the normal.

2. It is found also among persons whose capabilities are not disturbed, who on the contrary are distinguished by especially high intellectual development and ethical culture.

3. If one disregards the patients of one's own practice and strives to comprehend a wider field of experience, he will in two directions encounter facts which will prevent him from assuming inversions as a degenerative sign.

(*a*) It must be considered that inversion was a frequent manifestation among the ancient nations at the height of their culture. It was an institution endowed with important functions. (*b*) It is found to be unusually prevalent among savages and primitive races, whereas the term

degeneration is generally limited to higher civilization (I. Bloch). Even among the most civilized nations of Europe, climate and race have a most powerful influence on the distribution of, and attitude toward, inversion.

Innateness. — Only for the first and most extreme class of inverts, as can be imagined, has innateness been claimed, and this from their own assurance that at no time in their life has their sexual impulse followed a different course. The fact of the existence of two other classes, especially of the third, is difficult to reconcile with the assumption of its being congenital. Hence, the propensity of those holding this view to separate the group of absolute inverts from the others results in the abandonment of the general conception of inversion. Accordingly in a number of cases the inversion would be of a congenital character, while in others it might originate from other causes.

In contradistinction to this conception is that which assumes inversion to be an *acquired* character of the sexual impulse. It is based on the following facts. (1) In many inverts (even absolute ones) an early affective sexual impression can be demonstrated, as a result of which the homosexual inclination developed. (2) In many others outer influences of a promoting and inhibiting nature can be demonstrated, which in earlier or later life led to a fixation of the inversion — among which are exclusive relations with the same sex, companionship in war, detention in prison, dangers of hetero-sexual intercourse, celibacy, sexual weakness, etc. (3) Hypnotic suggestion may remove the inversion, which would be surprising in that of a congenital character.

In view of all this, the existence of congenital inversion can certainly be questioned. The objection may be made to it that a more accurate examination of those claimed to be congenitally inverted will probably show that the direction of the libido was determined by a definite experience of early childhood, which has not been retained in the conscious memory of the person, but which can be brought back to memory by proper influences (Havelock Ellis). According to that author inversion can be designated only as a frequent variation of the sexual impulse which may be determined by a number of external circumstances of life.

The apparent certainty thus reached is, however, overthrown by the retort that manifestly there are many persons who have experienced even in their early youth those very sexual influences, such as seduction, mutual

onanism, without becoming inverts, or without constantly remaining so. Hence, one is forced to assume that the alternatives congenital and acquired are either incomplete or do not cover the circumstances present in inversions.

Explanation of Inversion. — The nature of inversion is explained neither by the assumption that it is congenital nor that it is acquired. In the first case, we need to be told what there is in it of the congenital, unless we are satisfied with the roughest explanation, namely, that a person brings along a congenital sexual impulse connected with a definite sexual object. In the second case it is a question whether the manifold accidental influences suffice to explain the acquisition unless there is something in the individual to meet them half way. The negation of this last factor is inadmissible according to our former conclusions.

The Relation of Bisexuality. — Since the time of Frank Lydston, Kiernan, and Chevalier, a new series of ideas has been introduced for the explanation of the possibility of sexual inversion. This contains a new contradiction to the popular belief which assumes that a human being is either a man or a woman. Science shows cases in which the sexual characteristics appear blurred and thus the sexual distinction is made difficult, especially on an anatomical basis. The genitals of such persons unite the male and female characteristics (hermaphroditism). In rare cases both parts of the sexual apparatus are well developed (true hermaphroditism), but usually both are stunted.

The importance of these abnormalities lies in the fact that they unexpectedly facilitate the understanding of the normal formation. A certain degree of anatomical hermaphroditism really belongs to the normal. In no normally formed male or female are traces of the apparatus of the other sex lacking; these either continue functionless as rudimentary organs, or they are transformed for the purpose of assuming other functions.

The conception which we gather from this long known anatomical fact is the original predisposition to bisexuality, which in the course of development has changed to monosexuality, leaving slight remnants of the stunted sex.

It was natural to transfer this conception to the psychic sphere and to conceive the inversion in its aberrations as an expression of psychic hermaphroditism. In order to bring the question to a decision, it was only

necessary to have one other circumstance, viz., a regular concurrence of the inversion with the psychic and somatic signs of hermaphroditism.

But this second expectation was not realized. The relations between the assumed psychical and the demonstrable anatomical androgyny should never be conceived as being so close. There is frequently found in the inverted a diminution of the sexual impulse (H. Ellis) and a slight anatomical stunting of the organs. This, however, is found frequently but by no means regularly or preponderately. Thus we must recognize that inversion and somatic hermaphroditism are totally independent of each other.

Great importance has also been attached to the so-called secondary and tertiary sex characters and their aggregate occurrence in the inverted has been emphasized (H. Ellis). There is much truth in this but it should not be forgotten that the secondary and tertiary sex characteristics very frequently manifest themselves in the other sex, thus indicating androgyny without, however, involving changes in the sexual object in the sense of an inversion.

Psychic hermaphroditism would gain in substantiality if parallel with the inversion of the sexual object there should be at least a change in the other psychic qualities, such as in the impulses and distinguishing traits characteristic of the other sex. But such inversion of character can be expected with some regularity only in inverted women; in men the most perfect psychic manliness may be united with the inversion. If one firmly adheres to the hypothesis of a psychic hermaphroditism, one must add that in certain spheres its manifestations allow the recognition of only a very slight contrary determination. The same also holds true in the somatic androgyny. According to Halban, the appearance of individual stunted organs and secondary sex characters are quite independent of each other.

A spokesman of the masculine inverts stated the bisexual theory in its crudest form in the following words: “It is a female brain in a male body.” But we do not know the characteristics of a “female brain.” The substitution of the anatomical for the psychological is as frivolous as it is unjustified. The tentative explanation by v. Krafft-Ebing seems to be more precisely formulated than that of Ulrich but does not essentially differ from it. v. Krafft-Ebing thinks that the bisexual predisposition gives to the individual male and female brain centers as well as somatic sexual organs. These centers develop first towards puberty mostly under the influence of

the independent sex glands. We can, however, say the same of the male and female “centers” as of the male and female brains; and, moreover, we do not even know whether we can assume for the sexual functions separate brain locations (“centers”) such as we may assume for language.

After this discussion, two notions, at all events, persist; first, that a bisexual predisposition is to be presumed for the inversion also, only we do not know of what it consists beyond the anatomical formations; and, second, that we are dealing with disturbances which are experienced by the sexual impulse during its development.

The Sexual Object of Inverts. — The theory of psychic hermaphroditism presupposed that the sexual object of the inverted is the reverse of the normal. The inverted man, like the woman, succumbs to the charms emanating from manly qualities of body and mind; he feels himself like a woman and seeks a man.

But however true this may be for a great number of inverts, it by no means indicates the general character of inversion. There is no doubt that a great part of the male inverted have retained the psychic character of virility, that proportionately they show but little of the secondary characters of the other sex, and that they really look for real feminine psychic features in their sexual object. If that were not so it would be incomprehensible why masculine prostitution, in offering itself to inverts, copies in all its exterior, to-day as in antiquity, the dress and attitudes of woman. This imitation would otherwise be an insult to the ideal of the inverts. Among the Greeks, where the most manly men were found among inverts, it is quite obvious that it was not the masculine character of the boy which kindled the love of man, but it was his physical resemblance to woman as well as his feminine psychic qualities, such as shyness, demureness, and the need of instruction and help. As soon as the boy himself became a man he ceased to be a sexual object for men and in turn became a lover of boys. The sexual object in this case as in many others is therefore not of the like sex, but it unites both sex characters, a compromise between the impulses striving for the man and for the woman, but firmly conditioned by the masculinity of body (the genitals).

The conditions in the woman are more definite; here the active inverts, with special frequency, show the somatic and psychic characters of man and desire femininity in their sexual object; though even here greater variation will be found on more intimate investigation.

The Sexual Aim of Inverts. — The important fact to bear in mind is that no uniformity of the sexual aim can be attributed to inversion. Intercourse per anum in men by no means goes with inversion; masturbation is just as frequently the exclusive aim; and the limitation of the sexual aim to mere effusion of feelings is here even more frequent than in hetero-sexual love. In women, too, the sexual aims of the inverted are manifold, among which contact with the mucous membrane of the mouth seems to be preferred.

Conclusion. — Though from the material on hand we are by no means in a position satisfactorily to explain the origin of inversion, we can say that through this investigation we have obtained an insight which can become of greater significance to us than the solution of the above problem. Our attention is called to the fact that we have assumed a too close connection between the sexual impulse and the sexual object. The experience gained from the so called abnormal cases teaches us that a connection exists between the sexual impulse and the sexual object which we are in danger of overlooking in the uniformity of normal states where the impulse seems to bring with it the object. We are thus instructed to separate this connection between the impulse and the object. The sexual impulse is probably entirely independent of its object and is not originated by the stimuli proceeding from the object.

B. The Sexually Immature and Animals as Sexual Objects

Whereas those sexual inverts whose sexual object does not belong to the normally adapted sex, appear to the observer as a collective number of perhaps otherwise normal individuals, the persons who choose for their sexual object the sexually immature (children) are apparently from the first sporadic aberrations. Only exceptionally are children the exclusive sexual objects. They are mostly drawn into this rôle by a faint-hearted and impotent individual who makes use of such substitutes, or when an impulsive urgent desire cannot at the time secure the proper object. Still it throws some light on the nature of the sexual impulse, that it should suffer such great variation and depreciation of its object, a thing which hunger, adhering more energetically to its object, would allow only in the most extreme cases. The same may be said of sexual relations with animals — a thing not at all rare among farmers — where the sexual attraction goes beyond the limits of the species.

For esthetic reasons one would fain attribute this and other excessive aberrations of the sexual impulse to the insane, but this cannot be done. Experience teaches that among the latter no disturbances of the sexual impulse can be found other than those observed among the sane, or among whole races and classes. Thus we find with gruesome frequency sexual abuse of children by teachers and servants merely because they have the best opportunities for it. The insane present the aforesaid aberration only in a somewhat intensified form; or what is of special significance is the fact that the aberration becomes exclusive and takes the place of the normal sexual gratification.

This very remarkable relation of sexual variations ranging from the normal to the insane gives material for reflection. It seems to me that the fact to be explained would show that the impulses of the sexual life belong to those which even normally are most poorly controlled by the higher psychic activities. He who is in any way psychically abnormal, be it in social or ethical conditions, is, according to my experience, regularly so in his sexual life. But many are abnormal in their sexual life who in every other respect correspond to the average; they have followed the human cultural development, but sexuality remained as their weak point.

As a general result of these discussions we come to see that, under numerous conditions and among a surprising number of individuals, the nature and value of the sexual object steps into the background. There is something else in the sexual impulse which is the essential and constant.

2. DEVIATION IN REFERENCE TO THE SEXUAL AIM

The union of the genitals in the characteristic act of copulation is taken as the normal sexual aim. It serves to loosen the sexual tension and temporarily to quench the sexual desire (gratification analogous to satisfaction of hunger). Yet even in the most normal sexual process those additions are distinguishable, the development of which leads to the aberrations described as *perversions*. Thus certain intermediary relations to the sexual object connected with copulation, such as touching and looking, are recognized as preliminary to the sexual aim. These activities are on the one hand themselves connected with pleasure and on the other hand they enhance the excitement which persists until the definite sexual aim is reached. One definite kind of contiguity, consisting of mutual approximation of the mucous membranes of the lips in the form of a kiss, has received among the most civilized nations a sexual value, though the parts of the body concerned do not belong to the sexual apparatus but form the entrance to the digestive tract. This therefore supplies the factors which allow us to bring the perversions into relation with the normal sexual life, and which are available also for their classification. The perversions are either (*a*) anatomical *transgressions* of the bodily regions destined for sexual union, or (*b*) a *lingering* at the intermediary relations to the sexual object which should normally be rapidly passed on the way to the definite sexual aim.

(a) Anatomical Transgression

Overestimation of the Sexual Object. — The psychic estimation in which the sexual object as a goal of the sexual impulse shares is only in the rarest cases limited to the genitals; generally it embraces the whole body and tends to include all sensations emanating from the sexual object. The same overestimation spreads over the psychic sphere and manifests itself as a logical blinding (diminished judgment) in the face of the psychic attainments and perfections of the sexual object, as well as a blind obedience to the judgments issuing from the latter. The full faith of love thus becomes an important, if not the primordial source of authority.

It is this sexual overvaluation, which so ill agrees with the restriction of the sexual aim to the union of the genitals only, that assists other parts of the body to participate as sexual aims. In the development of this most manifold anatomical overestimation there is an unmistakable desire towards variation, a thing denominated by Hoche as "excitement-hunger" (Reiz-hunger).

Sexual Utilization of the Mucous Membrane of the Lips and Mouth. — The significance of the factor of sexual overestimation can be best studied in the man, in whom alone the sexual life is accessible to investigation, whereas in the woman it is veiled in impenetrable darkness, partly in consequence of cultural stunting and partly on account of the conventional reticence and dishonesty of women.

The employment of the mouth as a sexual organ is considered as a perversion if the lips (tongue) of the one are brought into contact with the genitals of the other, but not when the mucous membrane of the lips of both touch each other. In the latter exception we find the connection with the normal. He who abhors the former as perversions, though these since antiquity have been common practices among mankind, yields to a distinct *feeling of loathing* which protects him from adopting such sexual aims. The limit of such loathing is frequently purely conventional; he who kisses fervently the lips of a pretty girl will perhaps be able to use her tooth brush only with a sense of loathing, though there is no reason to assume that his own oral cavity for which he entertains no loathing is cleaner than that of the girl. Our attention is here called to the factor of loathing which stands in the way of the libidinous overestimation of the sexual aim, but

which may in turn be vanquished by the libido. In the loathing we may observe one of the forces which have brought about the restrictions of the sexual aim. As a rule these forces halt at the genitals; there is, however, no doubt that even the genitals of the other sex themselves may be an object of loathing. Such behavior is characteristic of all hysterics, especially women. The force of the sexual impulse prefers to occupy itself with the overcoming of this loathing (see below).

Sexual Utilization of the Anal Opening. — It is even more obvious than in the former case that it is the loathing which stamps as a perversion the use of the anus as a sexual aim. But it should not be interpreted as espousing a cause when I observe that the basis of this loathing — namely, that this part of the body serves for the excretion and comes in contact with the loathsome excrement — is not more plausible than the basis which hysterical girls have for the disgust which they entertain for the male genital because it serves for urination.

The sexual rôle of the mucous membrane of the anus is by no means limited to intercourse between men; its preference has nothing characteristic of the inverted feeling. On the contrary, it seems that the *pedicatio* of the man owes its rôle to the analogy with the act in the woman, whereas among inverts it is mutual masturbation which is the most common sexual aim.

The Significance of Other Parts of the Body. — Sexual infringement on the other parts of the body, in all its variations, offers nothing new; it adds nothing to our knowledge of the sexual impulse which herein only announces its intention to dominate the sexual object in every way. Besides the sexual overvaluation, a second and generally unknown factor may be mentioned among the anatomical transgressions. Certain parts of the body, like the mucous membrane of the mouth and anus, which repeatedly appear in such practices, lay claim as it were to be considered and treated as genitals. We shall hear how this claim is justified by the development of the sexual impulse, and how it is fulfilled in the symptomatology of certain morbid conditions.

Unfit Substitutes for the Sexual Object. Fetichism. — We are especially impressed by those cases in which for the normal sexual object another is substituted which is related to it but which is totally unfit for the normal sexual aim. According to the scheme of the introduction we should have done better to mention this most interesting group of

aberrations of the sexual impulse among the deviations in reference to the sexual object, but we have deferred mention of these until we became acquainted with the factor of sexual overestimation, upon which these manifestations, connected with the relinquishing of the sexual aim, depend.

The substitute for the sexual object is generally a part of the body but little adapted for sexual purposes, such as the foot, or hair, or an inanimate object which is in demonstrable relation with the sexual person, and preferably with the sexuality of the same (fragments of clothing, white underwear). This substitution is not unjustly compared with the fetich in which the savage sees the embodiment of his god.

The transition to the cases of fetichism, with a renunciation of a normal or of a perverted sexual aim, is formed by cases in which a fetichistic determination is demanded in the sexual object if the sexual aim is to be attained (definite color of hair, clothing, even physical blemishes). No other variation of the sexual impulse verging on the pathological claims our interest as much as this one, owing to the peculiarity occasioned by its manifestations. A certain diminution in the striving for the normal sexual aim may be presupposed in all these cases (executive weakness of the sexual apparatus). The connection with the normal is occasioned by the psychologically necessary overestimation of the sexual object, which inevitably encroaches upon everything associatively related to it (sexual object). A certain degree of such fetichism therefore regularly belong to the normal, especially during those stages of wooing when the normal sexual aim seems inaccessible or its realization deferred.

“Get me a handkerchief from her bosom — a garter of my love.”

— FAUST.

The case becomes pathological only when the striving for the fetich fixes itself beyond such determinations and takes the place of the normal sexual aim; or again, when the fetich disengages itself from the person concerned and itself becomes a sexual object. These are the general determinations for the transition of mere variations of the sexual impulse into pathological aberrations.

The persistent influence of a sexual impress mostly received in early childhood often shows itself in the selection of a fetich, as Binet first asserted, and as was later proven by many illustrations, — a thing which may be placed parallel to the proverbial attachment to a first love in the

normal (“On revient toujours à ses premiers amours”). Such a connection is especially seen in cases with only fetichistic determinations of the sexual object. The significance of early sexual impressions will be met again in other places.

In other cases it was mostly a symbolic thought association, unconscious to the person concerned, which led to the replacing of the object by means of a fetich. The paths of these connections can not always be definitely demonstrated. The foot is a very primitive sexual symbol already found in myths. Fur is used as a fetich probably on account of its association with the hairiness of the mons veneris. Such symbolism seems often to depend on sexual experiences in childhood.

(b) Fixation of Precursory Sexual Aims

The Appearance of New Intentions. — All the outer and inner determinations which impede or hold at a distance the attainment of the normal sexual aim, such as impotence, costliness of the sexual object, and dangers of the sexual act, will conceivably strengthen the inclination to linger at the preparatory acts and to form them into new sexual aims which may take the place of the normal. On closer investigation it is always seen that the ostensibly most peculiar of these new intentions have already been indicated in the normal sexual act.

Touching and Looking. — At least a certain amount of touching is indispensable for a person in order to attain the normal sexual aim. It is also generally known that the touching of the skin of the sexual object causes much pleasure and produces a supply of new excitement. Hence, the lingering at the touching can hardly be considered a perversion if the sexual act is proceeded with.

The same holds true in the end with looking which is analogous to touching. The manner in which the libidinous excitement is frequently awakened is by the optical impression, and selection takes account of this circumstance — if this teleological mode of thinking be permitted — by making the sexual object a thing of beauty. The covering of the body, which keeps abreast with civilization, serves to arouse sexual inquisitiveness, which always strives to restore for itself the sexual object by uncovering the hidden parts. This can be turned into the artistic ("sublimation") if the interest is turned from the genitals to the form of the body. The tendency to linger at this intermediary sexual aim of the sexually accentuated looking is found to a certain degree in most normals; indeed it gives them the possibility of directing a certain amount of their libido to a higher artistic aim. On the other hand, the fondness for looking becomes a perversion (*a*) when it limits itself entirely to the genitals; (*b*) when it becomes connected with the overcoming of loathing (voyeurs and onlookers at the functions of excretion); and (*c*) when instead of preparing for the normal sexual aim it suppresses it. The latter, if I may draw conclusions from a single analysis, is in a most pronounced way true of exhibitionists, who expose their genitals so as in turn to bring to view the genitals of others.

In the perversion which consists in striving to look and be looked at we are confronted with a very remarkable character which will occupy us even more intensively in the following aberration. The sexual aim is here present in twofold formation, in an *active* and a *passive* form.

The force which is opposed to the peeping mania and through which it is eventually abolished is *shame* (like the former loathing).

Sadism and Masochism. — The desire to cause pain to the sexual object and its opposite, the most frequent and most significant of all perversions, was designated in its two forms by v. Krafft-Ebing as sadism or the active form, and masochism or the passive form. Other authors prefer the narrower term algolagnia which emphasizes the pleasure in pain and cruelty, whereas the terms selected by v. Krafft-Ebing place the pleasure secured in all kinds of humility and submission in the foreground.

The roots of active algolagnia, sadism, can be readily demonstrable in the normal. The sexuality of most men shows a taint of *aggression*, it is a propensity to subdue, the biological significance of which lies in the necessity of overcoming the resistance of the sexual object by actions other than mere *courting*. Sadism would then correspond to an aggressive component of the sexual impulse which has become independent and exaggerated and has been brought to the foreground by displacement.

The conception of sadism fluctuates in the usage of language from a mere active or impetuous attitude towards the sexual object to the exclusive attachment of the gratification to the subjection and maltreatment of the object. Strictly speaking only the last extreme case has a claim to the name of perversion.

Similarly, the designation of masochism comprises all passive attitude to the sexual life and to the sexual object; in its most extreme form the gratification is connected with suffering of physical or mental pain at the hands of the sexual object. Masochism as a perversion seems to be still more remote from the normal sexual life by forming a contrast to it; it may be doubted whether it ever appears as a primary form or whether it does not more regularly originate through transformation from sadism. It can often be recognized that the masochism is nothing but a continuation of the sadism turning against one’s own person in which the latter at first takes the place of the sexual object. Analysis of extreme cases of masochistic perversions show that there is a coöperation of a large series

of factors which exaggerate and fix the original passive sexual attitude (castration complex, conscience).

The pain which is here overcome ranks with the loathing and shame which were the resistances opposed to the libido.

Sadism and masochism occupy a special place among the perversions, for the contrast of activity and passivity lying at their bases belong to the common traits of the sexual life.

That cruelty and sexual impulse are most intimately connected is beyond doubt taught by the history of civilization, but in the explanation of this connection no one has gone beyond the accentuation of the aggressive factors of the libido. The aggression which is mixed with the sexual impulse is according to some authors a remnant of cannibalistic lust, a participation on the part of the domination apparatus (Bemächtigungsapparatus), which served also for the gratification of the great wants of the other, ontogenetically the older impulse. It has also been claimed that every pain contains in itself the possibility of a pleasurable sensation. Let us be satisfied with the impression that the explanation of this perversion is by no means satisfactory and that it is possible that many psychic efforts unite themselves into one effect.

The most striking peculiarity of this perversion lies in the fact that its active and passive forms are regularly encountered together in the same person. He who experiences pleasure by causing pain to others in sexual relations is also able to experience the pain emanating from sexual relations as pleasure. A sadist is simultaneously a masochist, though either the active or the passive side of the perversion may be more strongly developed and thus represent his preponderate sexual activity.

We thus see that certain perverted propensities regularly appear in *contrasting pairs*, a thing which, in view of the material to be produced later, must claim great theoretical value. It is furthermore clear that the existence of the contrast, sadism and masochism, can not readily be attributed to the mixture of aggression. On the other hand one may be tempted to connect such simultaneously existing contrasts with the united contrast of male and female in bisexuality, the significance of which is reduced in psychoanalysis to the contrast of activity and passivity.

3. GENERAL STATEMENTS APPLICABLE TO ALL PERVERSIONS

Variation and Disease. — The physicians who at first studied the *perversions* in pronounced cases and under peculiar conditions were naturally inclined to attribute to them the character of a morbid or degenerative sign similar to the *inversions*. This view, however, is easier to refute in this than in the former case. Everyday experience has shown that most of these transgressions, at least the milder ones, are seldom wanting as components in the sexual life of normals who look upon them as upon other intimacies. Wherever the conditions are favorable such a perversion may for a long time be substituted by a normal person for the normal sexual aim or it may be placed near it. In no normal person does the normal sexual aim lack some designable perverse element, and this universality suffices in itself to prove the inexpediency of an opprobrious application of the name perversion. In the realm of the sexual life one is sure to meet with exceptional difficulties which are at present really unsolvable, if one wishes to draw a sharp line between the mere variations within physiological limits and morbid symptoms.

Nevertheless, the quality of the new sexual aim in some of these perversions is such as to require special notice. Some of the perversions are in content so distant from the normal that we cannot help calling them “morbid,” especially those in which the sexual impulse, in overcoming the resistances (shame, loathing, fear, and pain) has brought about surprising results (licking of feces and violation of cadavers). Yet even in these cases one ought not to feel certain of regularly finding among the perpetrators persons of pronounced abnormalities or insane minds. We can not lose sight of the fact that persons who otherwise behave normally are recorded as sick in the realm of the sexual life where they are dominated by the most unbridled of all impulses. On the other hand, a manifest abnormality in any other relation in life generally shows an undercurrent of abnormal sexual behavior.

In the majority of cases we are able to find the morbid character of the perversion not in the content of the new sexual aim but in its relation to the normal. It is morbid if the perversion does not appear beside the normal (sexual aim and sexual object), where favorable circumstances

promote it and unfavorable impede the normal, or if it has under all circumstances repressed and supplanted the normal; *the exclusiveness* and *fixation* of the perversion justifies us in considering it a morbid symptom.

The Psychic Participation in the Perversions. — Perhaps it is precisely in the most abominable perversions that we must recognize the most prolific psychic participation for the transformation of the sexual impulse. In these cases a piece of psychic work has been accomplished in which, in spite of its gruesome success, the value of an idealization of the impulse can not be disputed. The omnipotence of love nowhere perhaps shows itself stronger than in this one of her aberrations. The highest and the lowest everywhere in sexuality hang most intimately together. (“From heaven through the world to hell.”)

Two Results. — In the study of perversions we have gained an insight into the fact that the sexual impulse has to struggle against certain psychic forces, resistances, among which shame and loathing are most prominent. We may presume that these forces are employed to confine the impulse within the accepted normal limits, and if they have become developed in the individual before the sexual impulse has attained its full strength, it is really they which have directed it in the course of development.

We have furthermore remarked that some of the examined perversions can be comprehended only by assuming the union of many motives. If they are amenable to analysis — disintegration — they must be of a composite nature. This may give us a hint that the sexual impulse itself may not be something simple, that it may on the contrary be composed of many components which detach themselves to form perversions. Our clinical observation thus calls our attention to *fusions* which have lost their expression in the uniform normal behavior.

4. THE SEXUAL IMPULSE IN NEUROTICS

Psychoanalysis. — A proper contribution to the knowledge of the sexual impulse in persons who are at least related to the normal can be gained only from one source, and is accessible only by one definite path. There is only one way to obtain a thorough and unerring solution of problems in the sexual life of so-called psychoneurotics (hysteria, obsessions, the wrongly-named neurasthenia, and surely also dementia præcox, and paranoia), and that is by subjecting them to the psychoanalytic investigations propounded by J. Breuer and myself in 1893, which we called the “cathartic” treatment.

I must repeat what I have said in my published work, that these psychoneuroses, as far as my experience goes, are based on sexual motive powers. I do not mean that the energy of the sexual impulse merely contributes to the forces supporting the morbid manifestations (symptoms), but I wish distinctly to maintain that this supplies the only constant and the most important source of energy in the neurosis, so that the sexual life of such persons manifests itself either exclusively, preponderately, or partially in these symptoms. As I have already stated in different places, the symptoms are the sexual activities of the patient. The proof for this assertion I have obtained from the psychoanalysis of hysterics and other neurotics during a period of twenty years, the results of which I hope to give later in a detailed account.

Psychoanalysis removes the symptoms of hysteria on the supposition that they are the substitutes — the transcriptions as it were — for a series of emotionally accentuated psychic processes, wishes, and desires, to which a passage for their discharge through the conscious psychic activities has been cut off by a special process (repression). These thought formations which are restrained in the state of the unconscious strive for expression, that is, for *discharge*, in conformity to their affective value, and find such in hysteria through a process of *conversion* into somatic phenomena — the hysterical symptoms. If, *lege artis*, and with the aid of a special technique, retrogressive transformations of the symptoms into the affectful and conscious thoughts can be effected, it then becomes possible to get the most accurate information about the nature and origin of these previously unconscious psychic formations.

Results of Psychoanalysis. — In this manner it has been discovered that the symptoms represent the equivalent for the strivings which received their strength from the source of the sexual impulse. This fully concurs with what we know of the character of hysterics, which we have taken as models for all psycho-neurotics, before they have become diseased, and with what we know concerning the causes of the disease. The hysterical character evinces a part of sexual repression which reaches beyond the normal limits, an exaggeration of the resistances against the sexual impulse which we know as shame and loathing. It is an instinctive flight from intellectual occupation with the sexual problem, the consequence of which in pronounced cases is a complete sexual ignorance, which is preserved till the age of sexual maturity is attained.

This feature, so characteristic of hysteria, is not seldom concealed in crude observation by the existence of the second constitutional factor of hysteria, namely, the enormous development of the sexual craving. But the psychological analysis will always reveal it and solves the very contradictory enigma of hysteria by proving the existence of the contrasting pair, an immense sexual desire and a very exaggerated sexual rejection.

The provocation of the disease in hysterically predisposed persons is brought about if in consequence of their progressive maturity or external conditions of life they are earnestly confronted with the real sexual demand. Between the pressure of the craving and the opposition of the sexual rejection an outlet for the disease results, which does not remove the conflict but seeks to elude it by transforming the libidinous strivings into symptoms. It is an exception only in appearance if a hysterical person, say a man, becomes subject to some banal emotional disturbance, to a conflict in the center of which there is no sexual interest. Psychoanalysis will regularly show that it is the sexual components of the conflict which make the disease possible by withdrawing the psychic processes from normal adjustment.

Neurosis and Perversion. — A great part of the opposition to my assertion is explained by the fact that the sexuality from which I deduce the psychoneurotic symptoms is thought of as coincident with the normal sexual impulse. But psychoanalysis teaches us better than this. It shows that the symptoms do not by any means result at the expense only of the so called normal sexual impulse (at least not exclusively or preponderately),

but they represent the converted expression of impulses which in a broader sense might be designated as *perverse* if they could manifest themselves directly in phantasies and acts without deviating from consciousness. The symptoms are therefore partially formed at the cost of abnormal sexuality. *The neurosis is, so to say, the negative of the perversion.*

The sexual impulse of the psychoneurotic shows all the aberrations which we have studied as variations of the normal and as manifestations of morbid sexual life.

(*a*) In all the neurotics without exception we find feelings of inversion in the unconscious psychic life, fixation of libido on persons of the same sex. It is impossible, without a deep and searching discussion, adequately to appreciate the significance of this factor for the formation of the picture of the disease; I can only assert that the unconscious propensity to inversion is never wanting and is particularly of immense service in explaining male hysteria.

(*b*) All the inclinations to anatomical transgression can be demonstrated in psychoneurotics in the unconscious and as symptom-creators. Of special frequency and intensity are those which impart to the mouth and the mucous membrane of the anus the rôle of genitals.

(*c*) The partial desires which usually appear in contrasting pairs play a very prominent rôle among the symptom-creators in the psychoneuroses. We have learned to know them as carriers of new sexual aims, such as peeping mania, exhibitionism, and the actively and passively formed impulses of cruelty. The contribution of the last is indispensable for the understanding of the morbid nature of the symptoms; it almost regularly controls some portion of the social behavior of the patient. The transformation of love into hatred, of tenderness into hostility, which is characteristic of a large number of neurotic cases and apparently of all cases of paranoia, takes place by means of the union of cruelty with the libido.

The interest in these deductions will be more heightened by certain peculiarities of the diagnosis of facts.

α. There is nothing in the unconscious streams of thought of the neuroses which would correspond to an inclination towards fetichism; a circumstance which throws light on the psychological peculiarity of this well understood perversion.

β. Wherever any such impulse is found in the unconscious which can be paired with a contrasting one, it can regularly be demonstrated that the latter, too, is effective. Every active perversion is here accompanied by its passive counterpart. He who in the unconscious is an exhibitionist is at the same time a voyeur, he who suffers from sadistic feelings as a result of repression will also show another reinforcement of the symptoms from the source of masochistic tendencies. The perfect concurrence with the behavior of the corresponding positive perversions is certainly very noteworthy. In the picture of the disease, however, the preponderant rôle is played by either one or the other of the opposing tendencies.

γ. In a pronounced case of psychoneurosis we seldom find the development of one single perverted impulse; usually there are many and regularly there are traces of all perversions. The individual impulse, however, on account of its intensity, is independent of the development of the others, but the study of the positive perversions gives us the accurate counterpart to it.

PARTIAL IMPULSES AND EROGENOUS ZONES

Keeping in mind what we have learned from the examination of the positive and negative perversions, it becomes quite obvious that they can be referred to a number of "partial impulses," which are not, however, primary but are subject to further analysis. By an "impulse" we can understand in the first place nothing but the psychic representative of a continually flowing internal somatic source of excitement, in contradistinction to the "stimulus" which is produced by isolated excitements coming from without. The impulse is thus one of the concepts marking the limits between the psychic and the physical. The simplest and most obvious assumption concerning the nature of the impulses would be that in themselves they possess no quality but are only taken into account as a measure of the demand for effort in the psychic life. What distinguishes the impulses from one another and furnishes them with specific attributes is their relation to their somatic *sources* and to their *aims*. The source of the impulse is an exciting process in an organ, and the immediate aim of the impulse lies in the elimination of this organic stimulus.

Another preliminary assumption in the theory of the impulse which we cannot relinquish, states that the bodily organs furnish two kinds of excitements which are determined by differences of a chemical nature. One of these forms of excitement we designate as the specifically sexual and the concerned organ as the *erogenous zone*, while the sexual element emanating from it is the partial impulse.

In the perversions which claim sexual significance for the oral cavity and the anal opening the part played by the erogenous zone is quite obvious. It behaves in every way like a part of the sexual apparatus. In hysteria these parts of the body, as well as the tracts of mucous membrane proceeding from them, become the seat of new sensations and innervating changes in a manner similar to the real genitals when under the excitement of normal sexual processes.

The significance of the erogenous zones in the psychoneuroses, as additional apparatus and substitutes for the genitals, appears to be most prominent in hysteria though that does not signify that it is of lesser validity in the other morbid forms. It is not so recognizable in compulsion

neurosis and paranoia because here the symptom formation takes place in regions of the psychic apparatus which lie at a great distance from the central locations for bodily control. The more remarkable thing in the compulsion neurosis is the significance of the impulses which create new sexual aims and appear independently of the erogenous zones. Nevertheless, the eye corresponds to an erogenous zone in the looking and exhibition mania, while the skin takes on the same part in the pain and cruelty components of the sexual impulse. The skin, which in special parts of the body becomes differentiated as sensory organs and modified by the mucous membrane, is the erogenous zone, κατ ex ogen.

EXPLANATION OF THE MANIFEST PREPONDERANCE OF SEXUAL PERVERSIONS IN THE PSYCHONEUROSES

The sexuality of psychoneurotics has perhaps been placed in a false light by the above discussions. It appears that the sexual behavior of the psychoneurotic approaches in predisposition to the pervert and deviates by just so much from the normal. Nevertheless, it is very possible that the constitutional disposition of these patients besides containing an immense amount of sexual repression and a predominant force of sexual impulse also possesses an unusual tendency to perversions in the broadest sense. However, an examination of milder cases shows that the last assumption is not an absolute requisite, or at least that in pronouncing judgment on the morbid effects one ought to discount the effect of one of the factors. In most psychoneurotics the disease first appears after puberty following the demands of the normal sexual life. Against these the repression above all directs itself. Or the disease comes on later, owing to the fact that the libido is unable to attain normal sexual gratification. In both cases the libido behaves like a stream the principal bed of which is dammed; it fills the collateral roads which until now perhaps have been empty. Thus the manifestly great (though to be sure negative) tendency to perversion in psychoneurotics may be collaterally conditioned; at any rate, it is certainly collaterally increased. The fact of the matter is that the sexual repression has to be added as an inner factor to such external ones as restriction of freedom, inaccessibility to the normal sexual object, dangers of the normal sexual act, etc., which cause the origin of perversions in individuals who might have otherwise remained normal.

In individual cases of neurosis the behavior may be different; now the congenital force of the tendency to perversion may be more decisive and at other times more influence may be exerted by the collateral increase of the same through the deviation of the libido from the normal sexual aim and object. It would be unjust to construe a contrast where a cooperation exists. The greatest results will always be brought about by a neurosis if constitution and experience cooperate in the same direction. A pronounced constitution may perhaps be able to dispense with the assistance of daily impressions, while a profound disturbance in life may perhaps bring on a

neurosis even in an average constitution. These views similarly hold true in the etiological significance of the congenital and the accidental experiences in other spheres.

If, however, preference is given to the assumption that an especially formed tendency to perversions is characteristic of the psychoneurotic constitution, there is a prospect of being able to distinguish a multiformity of such constitutions in accordance with the congenital preponderance of this or that erogenous zone, or of this or that partial impulse. Whether there is a special relationship between the predisposition to perversions and the selection of the morbid picture has not, like many other things in this realm, been investigated.

REFERENCE TO THE INFANTILISM OF SEXUALITY

By demonstrating the perverted feelings as symptomatic formations in psychoneurotics, we have enormously increased the number of persons who can be added to the perverts. This is not only because neurotics represent a very large proportion of humanity, but we must consider also that the neuroses in all their gradations run in an uninterrupted series to the normal state. Moebius was quite justified in saying that we are all somewhat hysterical. Hence, the very wide dissemination of perversions urged us to assume that the predisposition to perversions is no rare peculiarity but must form a part of the normally accepted constitution.

We have heard that it is a question whether perversions should be referred to congenital determinations or whether they originate from accidental experiences, just as Binet showed in fetichisms. Now we are forced to the conclusion that there is indeed something congenital at the basis of perversions, but it is something *which is congenital in all persons*, which as a predisposition may fluctuate in intensity and is brought into prominence by influences of life. We deal here with congenital roots in the constitution of the sexual impulse which in one series of cases develop into real carriers of sexual activity (perverts); while in other cases they undergo an insufficient suppression (repression), so that as morbid symptoms they are enabled to attract to themselves in a round-about way a considerable part of the sexual energy; while again in favorable cases between the two extremes they originate the normal sexual life through effective restrictions and other elaborations.

But we must also remember that the assumed constitution which shows the roots of all perversions will be demonstrable only in the child, though all impulses can be manifested in it only in moderate intensity. If we are led to suppose that neurotics conserve the infantile state of their sexuality or return to it, our interest must then turn to the sexual life of the child, and we will then follow the play of influences which control the processes of development of the infantile sexuality up to its termination in a perversion, a neurosis or a normal sexual life.

Note 1: The facts contained in the first “Contribution” have been gathered from the familiar publications of Krafft-Ebing, Moll, Moebius, Havelock Ellis, Schrenk-Notzing, Löwenfeld, Eulenberg, J. Bloch, and M.

Hirschfeld, and from the later works published in the “Jahrbuch für sexuelle Zwischenstufen.” As these publications also mention the other literature bearing on this subject I may forbear giving detailed references.

The conclusions reached through the investigation of sexual inverts are all based on the reports of J. Sadger and on my own experience.

Note 2: For general use the word “libido” is best translated by “craving.” (Prof. James J. Putnam, Journal of Abnormal Psychology, Vol. IV, 6.)

Note 3: For the difficulties entailed in the attempt to ascertain the proportional number of inverts compare the work of M. Hirschfeld in the Jahrbuch für sexuelle Zwischenstufen, 1904. Cf. also Brill, The Conception of Homosexuality, Journal of the A.M.A., August 2, 1913.

Note 4: Such a striving against the compulsion to inversion favors cures by suggestion of psychoanalysis.

Note 5: Many have justly emphasized the fact that the autobiographic statements of inverts, as to the time of the appearance of their tendency to inversion, are untrustworthy as they may have repressed from memory any evidences of heterosexual feelings.

Psychoanalysis has confirmed this suspicion in all cases of inversion accessible, and has decidedly changed their anamnesis by filling up the infantile amnesias.

Note 6: With what reserve the diagnosis of degeneration should be made and what slight practical significance can be attributed to it can be gathered from the discussions of Moebius (Ueber Entartung; Grenzfragen des Nerven- und Seelenlebens, No. III, 1900). He says: “If we review the wide sphere of degeneration upon which we have here turned some light we can conclude without further ado that it is really of little value to diagnose degeneration.”

Note 7: We must agree with the spokesman of “Uranism” that some of the most prominent men known have been inverts and perhaps absolute inverts.

Note 8: In the conception of inversion the pathological features have been Separated from the anthropological. For this credit is due to I. Bloch (Beiträge zur Ätiologie der Psychopathia Sexualis, 2 Teile, 1902-3), who has also brought into prominence the existence of inversion in the old civilized nations.

Note 9: Compare the last detailed discussion of somatic hermaphroditism (Taruffi, Hermaphroditismus und Zeugungsunfähigkeit, German edit. by R. Teuscher, 1903), and the works of Neugebauer in many volumes of the Jahrbuch für sexuelle Zwischenstufen.

Note 10: J. Halban, “Die Entstehung der Geschlechtscharaktere,” Arch. für Gynäkologie, Bd. 70, 1903. See also there the literature on the subject.

Note 11: According to a report in Vol. 6 of the Jahrbuch f. sexuelle Zwischenstufen, E. Gley is supposed to have been the first to mention bisexuality as an explanation of inversion. He published a paper (Les Abérrations de l’instinct Sexuel) in the Revue Philosophique as early as January, 1884. It is moreover noteworthy that the majority of authors who trace the inversion to bisexuality assume this factor not only for the inverts but also for those who have developed normally, and justly interpret the inversion as a result of a disturbance in development. Among these authors are Chevalier (Inversion Sexuelle, 1893), and v. Krafft-Ebing (“Zur Erklärung der konträren Sexualempfindung,” Jahrbücher f. Psychiatrie u. Nervenheilkunde, XIII), who states that there are a number of observations “from which at least the virtual and continued existence of this second center (of the underlying sex) results.” A Dr. Arduin (Die Frauenfrage und die sexuellen Zwischenstufen, 2d vol. of the Jahrbuch f. sexuelle Zwischenstufen, 1900) states that “in every man there exist male and female elements.” See also the same Jahrbuch, Bd. I, 1899 (“Die objektive Diagnose der Homosexualitat,” by M. Hirschfeld, p-9). In the determination of sex, as far as heterosexual persons are concerned, some are disproportionately more strongly developed than others. G. Herman is firm in his belief “that in every woman there are male, and in every man there are female germs and qualities” (Genesis, das Gesetz der Zeugung, 9 Bd., Libido und Manie, 1903). As recently as 1906 W. Fliess (Der Ablauf des Lebens) has claimed ownership of the idea of bisexuality (in the sense of double sex). Psychoanalytic investigation very strongly opposes the attempt to separate homosexuals from other persons as a group of a special nature. By also studying sexual excitations other than the manifestly open ones it discovers that all men are capable of homosexual object selection and actually accomplish this in the unconscious. Indeed the attachments of libidinous feelings to persons of the same sex play no small rôle as factors in normal psychic life, and as causative factors of disease they play a greater rôle than those belonging to the opposite sex.

According to psychoanalysis, it rather seems that it is the independence of the object, selection of the sex of the object, the same free disposal over male and female objects, as observed in childhood, in primitive states and in prehistoric times, which forms the origin from which the normal as well as the inversion types developed, following restrictions in this or that direction. In the psychoanalytic sense the exclusive sexual interest of the man for the woman is also a problem requiring an explanation, and is not something that is self-evident and explainable on the basis of chemical attraction. The determination as to the definite sexual behavior does not occur until after puberty and is the result of a series of as yet not observable factors, some of which are of a constitutional, while some are of an accidental nature. Certainly some of these factors can turn out to be so enormous that by their character they influence the result. In general, however, the multiplicity of the determining factors is reflected by the manifoldness of the outcomes in the manifest sexual behavior of the person. In the inversion types it can be ascertained that they are altogether controlled by an archaic constitution and by primitive psychic mechanisms. The importance of the *narcissistic object selection* and the *clinging* to the erotic significance of the *anal* zone seem to be their most essential characteristics. But one gains nothing by separating the most extreme inversion types from the others on the basis of such constitutional peculiarities. What is found in the latter as seemingly an adequate determinant can also be demonstrated only in lesser force in the constitution of transitional types and in manifestly normal persons. The differences in the results may be of a qualitative nature, but analysis shows that the differences in the determinants are only quantitative. As a remarkable factor among the accidental influences of the object selection, we found the sexual rejection or the early sexual intimidation, and our attention was also called to the fact that the existence of both parents plays an important rôle in the child’s life. The disappearance of a strong father in childhood not infrequently favors the inversion. Finally, one might demand that the inversion of the sexual object should notionally be strictly separated from the mixing of the sex characteristics in the subject. A certain amount of independence is unmistakable also in this relation.

Note 12: Although psychoanalysis has not yet given us a full explanation for the origin of inversion, it has revealed the psychic mechanism of its genesis and has essentially enriched the problems in

question. In all the cases examined we have ascertained that the later inverts go through in their childhood a phase of very intense but short-lived fixation on the woman (usually on the mother) and after overcoming it they identify themselves with the woman and take themselves as the sexual object; that is, proceeding on a narcissistic basis, they look for young men resembling themselves in persons whom they wish to love as their mother has loved them. We have, moreover, frequently found that alleged inverts are by no means indifferent to the charms of women, but the excitation evoked by the woman is always transferred to a male object. They thus repeat through life the mechanism which gave origin to their inversion. Their obsessive striving for the man proves to be determined by their restless flight from the woman.

Note 13: The most pronounced difference between the sexual life (Liebesleben) of antiquity and ours lies in the fact that the ancients placed the emphasis on the impulse itself, while we put it on its object. The ancients extolled the impulse and were ready to ennoble through it even an inferior object, while we disparage the activity of the impulse as such and only countenance it on account of the merits of the object.

Note 14: I must mention here that the blind obedience evinced by the hypnotized subject to the hypnotist causes me to think that the nature of hypnosis is to be found in the unconscious fixation of the libido on the person of the hypnotizer (by means of the masochistic component of the sexual impulse).

Ferenczi connects this character of suggestibility with the “parent complex” (Jahrbuch für Psychoanalytische und psychopathologische Forschungen, I, 1909).

Note 15: Moreover, it is to be noted that sexual overvaluation does not become pronounced in all mechanisms of object selection, and that we shall later learn to know another and more direct explanation for the sexual rôle of the other parts of the body.

Note 16: Further investigations lead to the conclusion that I. Bloch has overestimated the factor of excitement-hunger (Reizhunger). The various roads upon which the libido moves behave to each other from the very beginning like communicating pipes; the factor of collateral streaming must also be considered.

Note 17: This weakness corresponds to the constitutional predisposition. The early sexual intimidation which pushes the person

away from the normal sexual aim and urges him to seek a substitute, has been demonstrated by psychoanalysis, as an accidental determinant.

Note 18: The shoe or slipper is accordingly a symbol for the female genitals.

Note 19: Psychoanalysis has filled up the gap in the understanding of fetichisms by showing that the selection of the fetich depends on a coprophilic smell-desire which has been lost by repression. Feet and hair are strong smelling objects which are raised to fetiches after the renouncing of the now unpleasant sensation of smell. Accordingly, only the filthy and ill-smelling foot is the sexual object in the perversion which corresponds to the foot fetichism. Another contribution to the explanation of the fetichistic preference of the foot is found in the Infantile Sexual Theories (see later). The foot replaces the penis which is so much missed in the woman. In some cases of foot fetichism it could be shown that the desire for looking originally directed to the genitals, which wished to reach its object from below, was stopped on the way by prohibition and repression, and therefore adhered to the foot or shoe as a fetich. In conformity with infantile expectation, the female genital was hereby imagined as a male genital.

Note 20: I have no doubt that the conception of the “beautiful” is rooted in the soil of sexual excitement and originally signified the sexual excitant. The more remarkable, therefore, is the fact that the genitals, the sight of which provokes the greatest sexual excitement, can really never be considered “beautiful.”

Note 21: Cf. here the later communication on the pregenital phases of the sexual development, in which this view is confirmed. See below, “Ambivalence.”

Note 22: Instead of substantiating this statement by many examples I will merely cite Havelock Ellis (The Sexual Impulse, 1903): “All known cases of sadism and masochism, even those cited by v. Krafft-Ebing, always show (as has already been shown by Colin, Scott, and Féré) traces of both groups of manifestations in the same individual.”

Note 23: On the other hand the restricting forces of the sexual evolution — disgust, shame, morality — must also be looked upon as historic precipitates of the outer inhibitions which the sexual impulse experienced in the psychogenesis of humanity. One can observe that they appear in

their time during the development of the individual almost spontaneously at the call of education and influence.

Note 24: Studien über Hysterie, 1895, J. Breuer tells of the patient on whom he first practiced the cathartic method: “The sexual factor was surprisingly undeveloped.”

Note 25: The well-known fancies of perverts which under favorable conditions are changed into contrivances, the delusional fears of paranoiacs which are in a hostile manner projected on others, and the unconscious fancies of hysterics which are discovered in their symptoms by psychoanalysis, agree as to content in the minutest details.

Note 26: A psychoneurosis very often associates itself with a manifest inversion in which the heterosexual feeling becomes subjected to complete repression. — It is but just to state that the necessity of a general recognition of the tendency to inversion in psychoneurotics was first imparted to me personally by Wilh. Fliess, of Berlin, after I had myself discovered it in some cases.

Note 27: It is not easy to justify here this assumption which was taken from a definite class of neurotic diseases. On the other hand, it would be impossible to assert anything definite concerning the impulses if one did not take the trouble of mentioning these presuppositions.

Note 28: One should here think of Moll’s assertion, who divides the sexual impulse into the impulses of contrectation and detumescence. Contrectation signifies a desire to touch the skin.

II. THE INFANTILE SEXUALITY

It is a part of popular belief about the sexual impulse that it is absent in childhood and that it first appears in the period of life known as puberty. This, though a common error, is serious in its consequences and is chiefly due to our present ignorance of the fundamental principles of the sexual life. A comprehensive study of the sexual manifestations of childhood would probably reveal to us the existence of the essential features of the sexual impulse, and would make us acquainted with its development and its composition from various sources.

The Neglect of the Infantile. — It is remarkable that those writers who endeavor to explain the qualities and reactions of the adult individual have given so much more attention to the ancestral period than to the period of the individual's own existence — that is, they have attributed more influence to heredity than to childhood. As a matter of fact, it might well be supposed that the influence of the latter period would be easier to understand, and that it would be entitled to more consideration than heredity. To be sure, one occasionally finds in medical literature notes on the premature sexual activities of small children, about erections and masturbation and even actions resembling coitus, but these are referred to merely as exceptional occurrences, as curiosities, or as deterring examples of premature perversity. No author has to my knowledge recognized the normality of the sexual impulse in childhood, and in the numerous writings on the development of the child the chapter on "Sexual Development" is usually passed over.

Infantile Amnesia. — This remarkable negligence is due partly to conventional considerations, which influence the writers on account of their own bringing up, and partly to a psychic phenomenon which has thus far remained unexplained. I refer to the peculiar amnesia which veils from most people (not from all!) the first years of their childhood, usually the first six or eight years. So far it has not occurred to us that this amnesia ought to surprise us, though we have good reasons for surprise. For we are informed that in those years from which we later obtain nothing except a few incomprehensible memory fragments, we have vividly reacted to impressions, that we have manifested pain and pleasure like any human being, that we have evinced love, jealousy, and other passions as they then

affected us; indeed we are told that we have uttered remarks which proved to grown-ups that we possessed understanding and a budding power of judgment. Still we know nothing of all this when we become older. Why does our memory lag behind all our other psychic activities? We really have reason to believe that at no time of life are we more capable of impressions and reproductions than during the years of childhood.

On the other hand we must assume, or we may convince ourselves through psychological observations on others, that the very impressions which we have forgotten have nevertheless left the deepest traces in our psychic life, and acted as determinants for our whole future development. We conclude therefore that we do not deal with a real forgetting of infantile impressions but rather with an amnesia similar to that observed in neurotics for later experiences, the nature of which consists in their being detained from consciousness (repression). But what forces bring about this repression of the infantile impressions? He who can solve this riddle will also explain hysterical amnesia.

We shall not, however, hesitate to assert that the existence of the infantile amnesia gives us a new point of comparison between the psychic states of the child and those of the psychoneurotic. We have already encountered another point of comparison when confronted by the fact that the sexuality of the psychoneurotic preserves the infantile character or has returned to it. May there not be an ultimate connection between the infantile and the hysterical amnesias?

The connection between the infantile and the hysterical amnesias is really more than a mere play of wit. The hysterical amnesia which serves the repression can only be explained by the fact that the individual already possesses a sum of recollections which have been withdrawn from conscious disposal and which by associative connection now seize that which is acted upon by the repelling forces of the repression emanating from consciousness. We may say that without infantile amnesia there would be no hysterical amnesia.

I believe that the infantile amnesia which causes the individual to look upon his childhood as if it were a *prehistoric* time and conceals from him the beginning of his own sexual life — that this amnesia is responsible for the fact that one does not usually attribute any value to the infantile period in the development of the sexual life. One single observer cannot fill the gap which has been thus produced in our knowledge. As early as 1896 I

had already emphasized the significance of childhood for the origin of certain important phenomena connected with the sexual life, and since then I have not ceased to put into the foreground the importance of the infantile factor for sexuality.

THE SEXUAL LATENCY PERIOD OF CHILDHOOD AND ITS INTERRUPTIONS

The extraordinary frequent discoveries of apparently abnormal and exceptional sexual manifestations in childhood, as well as the discovery of infantile reminiscences in neurotics, which were hitherto unconscious, allow us to sketch the following picture of the sexual behavior of childhood.

It seems certain that the newborn child brings with it the germs of sexual feelings which continue to develop for some time and then succumb to a progressive suppression, which is in turn broken through by the proper advances of the sexual development and which can be checked by individual idiosyncrasies. Nothing is known concerning the laws and periodicity of this oscillating course of development. It seems, however, that the sexual life of the child mostly manifests itself in the third or fourth year in some form accessible to observation.

The Sexual Inhibition. — It is during this period of total or at least partial latency that the psychic forces develop which later act as inhibitions on the sexual life, and narrow its direction like dams. These psychic forces are loathing, shame, and moral and esthetic ideal demands. We may gain the impression that the erection of these dams in the civilized child is the work of education; and surely education contributes much to it. In reality, however, this development is organically determined and can occasionally be produced without the help of education. Indeed education remains properly within its assigned realm only if it strictly follows the path of the organic determinant and impresses it somewhat cleaner and deeper.

Reaction Formation and Sublimation. — What are the means that accomplish these very important constructions so significant for the later personal culture and normality? They are probably brought about at the cost of the infantile sexuality itself, the influx of which has not stopped even in this latency period — the energy of which indeed has been turned away either wholly or partially from sexual utilization and conducted to other aims. The historians of civilization seem to be unanimous in the opinion that such deviation of sexual motive powers from sexual aims to new aims, a process which merits the name of *sublimation,* has furnished

powerful components for all cultural accomplishments. We will therefore add that the same process acts in the development of every individual, and that it begins to act in the sexual latency period.

We can also venture an opinion about the mechanisms of such sublimation. The sexual feelings of these infantile years on the one hand could not be utilizable, since the procreating functions are postponed, — this is the chief character of the latency period; on the other hand, they would in themselves be perverse, as they would emanate from erogenous zones and would be born of impulses which in the individual's course of development could only evoke a feeling of displeasure. They therefore awaken contrary forces (feelings of reaction), which in order to suppress such displeasure, build up the above mentioned psychic dams: loathing, shame, and morality.

The Interruptions of the Latency Period. — Without deluding ourselves as to the hypothetical nature and deficient clearness of our understanding regarding the infantile period of latency and delay, we will return to reality and state that such a utilization of the infantile sexuality represents an ideal bringing up from which the development of the individual usually deviates in some measure and often very considerably. A portion of the sexual manifestation which has withdrawn from sublimation occasionally breaks through, or a sexual activity remains throughout the whole duration of the latency period until the reinforced breaking through of the sexual impulse in puberty. In so far as they have paid any attention to infantile sexuality the educators behave as if they shared our views concerning the formation of the moral forces of defence at the cost of sexuality, and as if they knew that sexual activity makes the child uneducable; for the educators consider all sexual manifestations of the child as an "evil" in the face of which little can be accomplished. We have, however, every reason for directing our attention to those phenomena so much feared by the educators, for we expect to find in them the solution of the primitive formation of the sexual impulse.

THE MANIFESTATIONS OF THE INFANTILE SEXUALITY

For reasons which we shall discuss later we will take as a model of the infantile sexual manifestations thumbsucking (pleasure-sucking), to which the Hungarian pediatrist, Lindner, has devoted an excellent essay.

Thumbsucking. — Thumbsucking, which manifests itself in the nursing baby and which may be continued till maturity or throughout life, consists in a rhythmic repetition of sucking contact with the mouth (the lips), wherein the purpose of taking nourishment is excluded. A part of the lip itself, the tongue, which is another preferable skin region within reach, and even the big toe — may be taken as objects for sucking. Simultaneously, there is also a desire to grasp things, which manifests itself in a rhythmical pulling of the ear lobe and which may cause the child to grasp a part of another person (generally the ear) for the same purpose. The pleasure-sucking is connected with an entire exhaustion of attention and leads to sleep or even to a motor reaction in the form of an orgasm. Pleasure-sucking is often combined with a rubbing contact with certain sensitive parts of the body, such as the breast and external genitals. It is by this road that many children go from thumb-sucking to masturbation.

Lindner himself has recognized the sexual nature of this action and openly emphasized it. In the nursery thumbsucking is often treated in the same way as any other sexual “naughtiness” of the child. A very strong objection was raised against this view by many pediatrists and neurologists which in part is certainly due to the confusion of the terms “sexual” and “genital.” This contradiction raises the difficult question, which cannot be rejected, namely, in what general traits do we wish to recognize the sexual manifestations of the child. I believe that the association of the manifestations into which we gained an insight through psychoanalytic investigation justify us in claiming thumbsucking as a sexual activity and in studying through it the essential features of the infantile sexual activity.

Autoerotism. — It is our duty here to arrange this state of affairs differently. Let us insist that the most striking character of this sexual activity is that the impulse is not directed against other persons but that it gratifies itself on its own body; to use the happy term invented by Havelock Ellis, we will say that it is autoerotic.

It is, moreover, clear that the action of the thumbsucking child is determined by the fact that it seeks a pleasure which has already been experienced and is now remembered. Through the rhythmic sucking on a portion of the skin or mucous membrane it finds the gratification in the simplest way. It is also easy to conjecture on what occasions the child first experienced this pleasure which it now strives to renew. The first and most important activity in the child's life, the sucking from the mother's breast (or its substitute), must have acquainted it with this pleasure. We would say that the child's lips behaved like an *erogenous zone*, and that the excitement through the warm stream of milk was really the cause of the pleasurable sensation. To be sure, the gratification of the erogenous zone was at first united with the gratification of taking nourishment. He who sees a satiated child sink back from the mother's breast, and fall asleep with reddened cheeks and blissful smile, will have to admit that this picture remains as typical of the expression of sexual gratification in later life. But the desire for repetition of the sexual gratification is separated from the desire for taking nourishment; a separation which becomes unavoidable with the appearance of the teeth when the nourishment is no longer sucked in but chewed. The child does not make use of a strange object for sucking but prefers its own skin because it is more convenient, because it thus makes itself independent of the outer world which it cannot yet control, and because in this way it creates for itself, as it were, a second, even if an inferior, erogenous zone. The inferiority of this second region urges it later to seek the same parts, the lips of another person. ("It is a pity that I cannot kiss myself," might be attributed to it.)

Not all children suck their thumbs. It may be assumed that it is found only in children in whom the erogenous significance of the lip-zone is constitutionally reënforced. Children in whom this is retained are habitual kissers as adults and show a tendency to perverse kissing, or as men they have a marked desire for drinking and smoking. But if repression comes into play they experience disgust for eating and evince hysterical vomiting. By virtue of the community of the lip-zone the repression encroaches upon the impulse of nourishment. Many of my female patients showing disturbances in eating, such as hysterical globus, choking sensations, and vomiting, have been energetic thumbsuckers during infancy.

In the thumbsucking or pleasure-sucking we have already been able to observe the three essential characters of an infantile sexual manifestation. The latter has its origin in conjunction with a bodily function which is very important for life, it does not yet know any sexual object, it is *autoerotic* and its sexual aim is under the control of an *erogenous zone*. Let us assume for the present that these characters also hold true for most of the other activities of the infantile sexual impulse.

THE SEXUAL AIM OF THE INFANTILE SEXUALITY

The Characters of the Erogenous Zones. — From the example of thumbsucking we may gather a great many points useful for the distinguishing of an erogenous zone. It is a portion of skin or mucous membrane in which the stimuli produce a feeling of pleasure of definite quality. There is no doubt that the pleasure-producing stimuli are governed by special determinants which we do not know. The rhythmic characters must play some part in them and this strongly suggests an analogy to tickling. It does not, however, appear so certain whether the character of the pleasurable feeling evoked by the stimulus can be designated as "peculiar," and in what part of this peculiarity the sexual factor exists. Psychology is still groping in the dark when it concerns matters of pleasure and pain, and the most cautious assumption is therefore the most advisable. We may perhaps later come upon reasons which seem to support the peculiar quality of the sensation of pleasure.

The erogenous quality may adhere most notably to definite regions of the body. As is shown by the example of thumbsucking, there are predestined erogenous zones. But the same example also shows that any other region of skin or mucous membrane may assume the function of an erogenous zone; it must therefore carry along a certain adaptability. The production of the sensation of pleasure therefore depends more on the quality of the stimulus than on the nature of the bodily region. The thumbsucking child looks around on his body and selects any portion of it for pleasure-sucking, and becoming accustomed to it, he then prefers it. If he accidentally strikes upon a predestined region, such as breast, nipple or genitals, it naturally has the preference. A quite analogous tendency to displacement is again found in the symptomatology of hysteria. In this neurosis the repression mostly concerns the genital zones proper; these in turn transmit their excitation to the other erogenous zones, usually dormant in mature life, which then behave exactly like genitals. But besides this, just as in thumbsucking, any other region of the body may become endowed with the excitation of the genitals and raised to an erogenous zone. Erogenous and hysterogenous zones show the same characters.

The Infantile Sexual Aim. — The sexual aim of the infantile impulse consists in the production of gratification through the proper excitation of this or that selected erogenous zone. In order to leave a desire for its repetition this gratification must have been previously experienced, and we may be sure that nature has devised definite means so as not to leave this occurrence to mere chance. The arrangement which has fulfilled this purpose for the lip-zone we have already discussed; it is the simultaneous connection of this part of the body with the taking of nourishment. We shall also meet other similar mechanisms as sources of sexuality. The state of desire for repetition of gratification can be recognized through a peculiar feeling of tension which in itself is rather of a painful character, and through a centrally-determined feeling of itching or sensitiveness which is projected into the peripheral erogenous zone. The sexual aim may therefore be formulated as follows: the chief object is to substitute for the projected feeling of sensitiveness in the erogenous zone that outer stimulus which removes the feeling of sensitiveness by evoking the feeling of gratification. This external stimulus consists usually in a manipulation which is analogous to sucking.

It is in full accord with our physiological knowledge if the desire happens to be awakened also peripherally through an actual change in the erogenous zone. The action is puzzling only to some extent as one stimulus for its suppression seems to want another applied to the same place.

THE MASTURBATIC SEXUAL MANIFESTATIONS

It is a matter of great satisfaction to know that there is nothing further of greater importance to learn about the sexual activity of the child after the impulse of one erogenous zone has become comprehensible to us. The most pronounced differences are found in the action necessary for the gratification, which consists in sucking for the lip zone and which must be replaced by other muscular actions according to the situation and nature of the other zones.

The Activity of the Anal Zone. — Like the lip zone the anal zone is, through its position, adapted to conduct the sexuality to the other functions of the body. It should be assumed that the erogenous significance of this region of the body was originally very large. Through psychoanalysis one finds, not without surprise, the many transformations that are normally undertaken with the usual excitations emanating from here, and that this zone often retains for life a considerable fragment of genital irritability. The intestinal catarrhs so frequent during infancy produce intensive irritations in this zone, and we often hear it said that intestinal catarrh at this delicate age causes “nervousness.” In later neurotic diseases they exert a definite influence on the symptomatic expression of the neurosis, placing at its disposal the whole sum of intestinal disturbances. Considering the erogenous significance of the anal zone which has been retained at least in transformation, one should not laugh at the hemorrhoidal influences to which the old medical literature attached so much weight in the explanation of neurotic states.

Children utilizing the erogenous sensitiveness of the anal zone can be recognized by their holding back of fecal masses until through accumulation there result violent muscular contractions; the passage of these masses through the anus is apt to produce a marked irritation of the mucus membrane. Besides the pain this must produce also a sensation of pleasure. One of the surest premonitions of later eccentricity or nervousness is when an infant obstinately refuses to empty his bowel when placed on the chamber by the nurse and reserves this function at its own pleasure. It does not concern him that he will soil his bed; all he cares for is not to lose the subsidiary pleasure while defecating. The educators have again the right inkling when they designate children who withhold these

functions as bad. The content of the bowel which is an exciting object to the sexually sensitive surface of mucous membrane behaves like the precursor of another organ which does not become active until after the phase of childhood. In addition it has other important meanings to the nursling. It is evidently treated as an additional part of the body, it represents the first "donation," the disposal of which expresses the pliability while the retention of it can express the spite of the little being towards its environment. From the idea of "donation" he later gains the meaning of the "babe" which according to one of the infantile sexual theories is acquired through eating and is born through the bowel.

The retention of fecal masses, which is at first intentional in order to utilize them, as it were, for masturbatic excitation of the anal zone, is at least one of the roots of constipation so frequent in neuropaths. The whole significance of the anal zone is mirrored in the fact that there are but few neurotics who have not their special scatologic customs, ceremonies, etc., which they retain with cautious secrecy.

Real masturbatic irritation of the anal zone by means of the fingers, evoked through either centrally or peripherally supported itching, is not at all rare in older children.

The Activity of the Genital Zone. — Among the erogenous zones of the child's body there is one which certainly does not play the main rôle, and which cannot be the carrier of earliest sexual feeling — which, however, is destined for great things in later life. In both male and female it is connected with the voiding of urine (penis, clitoris), and in the former it is enclosed in a sack of mucous membrane, probably in order not to miss the irritations caused by the secretions which may arouse the sexual excitement at an early age. The sexual activities of this erogenous zone, which belongs to the real genitals, are the beginning of the later normal sexual life.

Owing to the anatomical position, the overflowing of secretions, the washing and rubbing of the body, and to certain accidental excitements (the wandering of intestinal worms in the girl), it happens that the pleasurable feeling which these parts of the body are capable of producing makes itself noticeable to the child even during the sucking age, and thus awakens desire for its repetition. When we review all the actual arrangements, and bear in mind that the measures for cleanliness have the same effect as the uncleanliness itself, we can then scarcely mistake

nature's intention, which is to establish the future primacy of these erogenous zones for the sexual activity through the infantile onanism from which hardly an individual escapes. The action of removing the stimulus and setting free the gratification consists in a rubbing contiguity with the hand or in a certain previously-formed pressure reflex effected by the closure of the thighs. The latter procedure seems to be the more primitive and is by far the more common in girls. The preference for the hand in boys already indicates what an important part of the male sexual activity will be accomplished in the future by the impulse to mastery (Bemächtigungstrieb). It can only help towards clearness if I state that the infantile masturbation should be divided into three phases. The first phase belongs to the nursing period, the second to the short flourishing period of sexual activity at about the fourth year, only the third corresponds to the one which is often considered exclusively as onanism of puberty.

The infantile onanism seems to disappear after a brief time, but it may continue uninterruptedly till puberty and thus represent the first marked deviation from the development desirable for civilized man. At some time during childhood after the nursing period, the sexual impulse of the genitals reawakens and continues active for some time until it is again suppressed, or it may continue without interruption. The possible relations are very diverse and can only be elucidated through a more precise analysis of individual cases. The details, however, of this *second* infantile sexual activity leave behind the profoundest (unconscious) impressions in the persons's memory; if the individual remains healthy they determine his character and if he becomes sick after puberty they determine the symptomatology of his neurosis. In the latter case it is found that this sexual period is forgotten and the conscious reminiscences pointing to them are displaced; I have already mentioned that I would like to connect the normal infantile amnesia with this infantile sexual activity. By psychoanalytic investigation it is possible to bring to consciousness the forgotten material, and thereby to remove a compulsion which emanates from the unconscious psychic material.

The Return of the Infantile Masturbation. — The sexual excitation of the nursing period returns during the designated years of childhood as a centrally determined tickling sensation demanding onanistic gratification, or as a pollution-like process which, analogous to the pollution of maturity, may attain gratification without the aid of any action. The latter

case is more frequent in girls and in the second half of childhood; its determinants are not well understood, but it often, though not regularly, seems to have as a basis a period of early active onanism. The symptomatology of this sexual manifestation is poor; the genital apparatus is still undeveloped and all signs are therefore displayed by the urinary apparatus which is, so to say, the guardian of the genital apparatus. Most of the so-called bladder disturbances of this period are of a sexual nature; whenever the enuresis nocturna does not represent an epileptic attack it corresponds to a pollution.

The return of the sexual activity is determined by inner and outer causes which can be conjectured from the formation of the symptoms of neurotic diseases and definitely revealed by psychoanalytic investigations. The internal causes will be discussed later, the accidental outer causes attain at this time a great and permanent significance. As the first outer cause we have the influence of seduction which prematurely treats the child as a sexual object; under conditions favoring impressions this teaches the child the gratification of the genital zones, and thus usually forces it to repeat this gratification in onanism. Such influences can come from adults or other children. I cannot admit that I overestimated its frequency or its significance in my contributions to the etiology of hysteria, though I did not know then that normal individuals may have the same experiences in their childhood, and hence placed a higher value on seductions than on the factors found in the sexual constitution and development. It is quite obvious that no seduction is necessary to awaken the sexual life of the child, that such an awakening may come on spontaneously from inner sources.

Polymorphous-perverse Disposition. — It is instructive to know that under the influence of seduction the child may become polymorphous-perverse and may be misled into all sorts of transgressions. This goes to show that it carries along the adaptation for them in its disposition. The formation of such perversions meets but slight resistance because the psychic dams against sexual transgressions, such as shame, loathing and morality — which depend on the age of the child — are not yet erected or are only in the process of formation. In this respect the child perhaps does not behave differently from the average uncultured woman in whom the same polymorphous-perverse disposition exists. Such a woman may remain sexually normal under usual conditions, but under the guidance of

a clever seducer she will find pleasure in every perversion and will retain the same as her sexual activity. The same polymorphous or infantile disposition fits the prostitute for her professional activity, and in the enormous number of prostitutes and of women to whom we must attribute an adaptation for prostitution, even if they do not follow this calling, it is absolutely impossible not to recognize in their uniform disposition for all perversions the universal and primitive human.

Partial Impulses. — For the rest, the influence of seduction does not aid us in unravelling the original relations of the sexual impulse, but rather confuses our understanding of the same, inasmuch as it prematurely supplies the child with the sexual object at a time when the infantile sexual impulse does not yet evince any desire for it. We must admit, however, that the infantile sexual life, though mainly under the control of erogenous zones, also shows components in which from the very beginning other persons are regarded as sexual objects. Among these we have the impulses for looking and showing off, and for cruelty, which manifest themselves somewhat independently of the erogenous zones and which only later enter into intimate relationship with the sexual life; but along with the erogenous sexual activity they are noticeable even in the infantile years as separate and independent strivings. The little child is above all shameless, and during its early years it evinces definite pleasure in displaying its body and especially its sexual organs. A counterpart to this desire which is to be considered as perverse, the curiosity to see other persons' genitals, probably appears first in the later years of childhood when the hindrance of the feeling of shame has already reached a certain development. Under the influence of seduction the looking perversion may attain great importance for the sexual life of the child. Still, from my investigations of the childhood years of normal and neurotic patients, I must conclude that the impulse for looking can appear in the child as a spontaneous sexual manifestation. Small children, whose attention has once been directed to their own genitals — usually by masturbation — are wont to progress in this direction without outside interference, and to develop a vivid interest in the genitals of their playmates. As the occasion for the gratification of such curiosity is generally afforded during the gratification of both excrementitious needs, such children become *voyeurs* and are zealous spectators at the voiding of urine and feces of others, After this tendency has been repressed, the curiosity to see the genitals of others

(one’s own or those of the other sex) remains as a tormenting desire which in some neurotic cases furnishes the strongest motive power for the formation of symptoms.

The cruelty component of the sexual impulse develops in the child with still greater independence of those sexual activities which are connected with erogenous zones. Cruelty is especially near the childish character, since the inhibition which restrains the impulse to mastery before it causes pain to others — that is, the capacity for sympathy — develops comparatively late. As we know, a thorough psychological analysis of this impulse has not as yet been successfully accomplished; we may assume that the cruel feelings emanate from the impulse to mastery and appear at a period in the sexual life before the genitals have taken on their later rôle. It then dominates a phase of the sexual life, which we shall later describe as the pregenital organization. Children who are distinguished for evincing especial cruelty to animals and playmates may be justly suspected of intensive and premature sexual activity in the erogenous zones; and in a simultaneous prematurity of all sexual impulses, the erogenous sexual activity surely seems to be primary. The absence of the barrier of sympathy carries with it the danger that the connections between cruelty and the erogenous impulses formed in childhood cannot be broken in later life.

An erogenous source of the passive impulse for cruelty (masochism) is found in the painful irritation of the gluteal region which is familiar to all educators since the confessions of J.J. Rousseau. This has justly caused them to demand that physical punishment, which usually concerns this part of the body, should be withheld from all children in whom the libido might be forced into collateral roads by the later demands of cultural education.

THE INFANTILE SEXUAL INVESTIGATION

Inquisitiveness. — At the same time when the sexual life of the child reaches its first bloom, from the age of three to the age of five, it also evinces the beginning of that activity which is ascribed to the impulse for knowledge and investigation. The desire for knowledge can neither be added to the elementary components of the impulses nor can it be altogether subordinated under sexuality. Its activity corresponds on the one hand to a sublimating mode of acquisition and on the other hand it labors with the energy of the desire for looking. Its relations to the sexual life, however, are of particular importance, for we have learned from psychoanalysis that the inquisitiveness of children is attracted to the sexual problems unusually early and in an unexpectedly intensive manner, indeed it perhaps may first be awakened by the sexual problems.

The Riddle of the Sphinx. — It is not theoretical but practical interests which start the work of the investigation activity in the child. The threat to the conditions of his existence through the actual or expected arrival of a new child, the fear of the loss in care and love which is connected with this event, cause the child to become thoughtful and sagacious. Corresponding with the history of this awakening, the first problem with which it occupies itself is not the question as to the difference between the sexes, but the riddle: from where do children come? In a distorted form, which can easily be unraveled, this is the same riddle which was given by the Theban Sphinx. The fact of the two sexes is usually first accepted by the child without struggle and hesitation. It is quite natural for the male child to presuppose in all persons it knows a genital like his own, and to find it impossible to harmonize the lack of it with his conception of others.

The Castration Complex. — This conviction is energetically adhered to by the boy and tenaciously defended against the contradictions which soon result, and are only given up after severe internal struggles (castration complex). The substitutive formations of this lost penis of the woman play a great part in the formation of many perversions.

The assumption of the same (male) genital in all persons is the first of the remarkable and consequential infantile sexual theories. It is of little help to the child when biological science agrees with his preconceptions and recognizes the feminine clitoris as the real substitute for the penis.

The little girl does not react with similar refusals when she sees the differently formed genital of the boy. She is immediately prepared to recognize it, and soon becomes envious of the penis; this envy reaches its highest point in the consequentially important wish that she also should be a boy.

Birth Theories. — Many people can remember distinctly how intensely they interested themselves, in the prepubescent period, in the question where children came from. The anatomical solutions at that time read very differently; the children come out of the breast or are cut out of the body, or the navel opens itself to let them out. Outside of analysis one only seldom remembers the investigation corresponding to the early childhood years; it had long merged into repression but its results were thoroughly uniform. One gets children by eating something special (as in the fairy tale) and they are born through the bowel like a passage. These infantile theories recall the structures in the animal kingdom, especially do they recall the cloaca of the types which stand lower than the mammals.

Sadistic Conception of the Sexual Act. — If children of so delicate an age become spectators of the sexual act between grown-ups, for which an occasion is furnished by the conviction of the grown-ups that little children cannot understand anything sexual, they cannot help conceiving the sexual act as a kind of maltreating or overpowering, that is, it impresses them in a sadistic sense. Psychoanalysis also teaches us that such an early childhood impression contributes much to the disposition for a later sadistic displacement of the sexual aim. Besides this children also occupy themselves with the problem of what the sexual act consists in or, as they grasp it, of what marriage consists, and seek the solution of the mystery mostly in an association to which the functions of urination and defecation give occasion.

The Typical Failure of the Infantile Sexual Investigation. — It can be stated in general about the infantile sexual theories that they are reproductions of the child’s own sexual constitution, and that despite their grotesque mistakes they evince more understanding of the sexual processes than is credited to their creators. Children also perceive the pregnancy of the mother and know how to interpret it correctly; the stork fable is very often related before auditors who confront it with a deep, but mostly mute suspicion. But as two elements remain unknown to the

infantile sexual investigation, namely, the rôle of the propagating semen and the female genital opening — precisely the same points in which the infantile organization is still backward — the effort of the infantile investigator regularly remains fruitless, and ends in a renunciation which not infrequently leaves a lasting injury to the desire for knowledge. The sexual investigation of these early childhood years is always conducted alone, it signifies the first step towards independent orientation in the world, and causes a marked estrangement between the child and the persons of his environment who formerly enjoyed its full confidence.

The Phases of Development of the Sexual Organization. — As characteristics of the infantile sexuality we have hitherto emphasized the fact that it is essentially autoerotic (it finds its object in its own body), and that its individual partial impulses, which on the whole are unconnected and independent of one another, are striving for the acquisition of pleasure. The end of this development forms the so-called normal sexual life of the adult in which the acquisition of pleasure has been put into the service of the function of propagation, and the partial impulses, under the primacy of one single erogenous zone, have formed a firm organization for the attainment of the sexual aim in a strange sexual object.

Pregenital Organizations. — The study, with the help of psychoanalysis, of the inhibitions and disturbances in this course of development now permits us to recognize additions and primary stages of such organization of the partial impulses which likewise furnish a sort of sexual regime. These phases of the sexual organization normally will pass over smoothly and will only be recognizable by slight indications. Only in pathological cases do they become active and discernible to coarse observation.

Organizations of the sexual life in which the genital zones have not yet assumed the dominating rôle we would call the *pregenital* phase. So far we have become acquainted with two of them which recall reversions to early animal states.

One of the first of such pregenital sexual organizations is the *oral*, or if we wish, the cannibalistic. Here the sexual activity is not yet separated from the taking of nourishment, and the contrasts within the same not yet differentiated. The object of the one activity is also that of the other, the sexual aim consists in the *incorporating* into one’s own body of the object, it is the prototype of that which later plays such an important psychic rôle

as *identification*. As a remnant of this fictitious phase of organization forced on us by pathology we can consider thumbsucking. Here the sexual activity became separated from the nourishment activity and the strange object was given up in favor of one from his own body.

A second pregenital phase is the sadistic-anal organization. Here the contrasts which run through the whole sexual life are already developed, but cannot yet be designated as *masculine* and *feminine*, but must be called *active* and *passive*. The activity is supplied by the musculature of the body through the mastery impulse; the erogenous mucous membrane of the bowel manifests itself above all as an organ with a passive sexual aim, for both strivings there are objects present, which however do not merge together. Besides them there are other partial impulses which are active in an autoerotic manner. The sexual polarity and the strange object can thus already be demonstrated in this phase. The organization and subordination under the function of propagation are still lacking.

Ambivalence. — This form of the sexual organization could be retained throughout life and continue to draw to itself a large part of the sexual activity. The prevalence of sadism and the rôle of the cloaca of the anal zone stamps it with an exquisitely archaic impression. As another characteristic belonging to it we can mention the fact that the contrasting pair of impulses are developed in almost the same manner, a behavior which was designated by Bleuler with the happy name of *ambivalence*.

The assumption of the pregenital organizations of the sexual life is based on the analysis of the neuroses and hardly deserves any consideration without a knowledge of the same. We may expect that continued analytic efforts will furnish us with still more disclosures concerning the structure and development of the normal sexual function.

To complete the picture of the infantile sexual life one must add that frequently or regularly an object selection takes place even in childhood which is as characteristic as the one we have represented for the phase of development of puberty. This object selection proceeds in such a manner that all the sexual strivings proceed in the direction of one person in whom they wish to attain their aim. This is then the nearest approach to the definitive formation of the sexual life after puberty, that is possible in childhood. It differs from the latter only in the fact that the collection of the partial impulses and their subordination to the primacy of the genitals is very imperfectly or not at all accomplished in childhood. The

establishment of this primacy in the service of propagation is therefore the last phase through which the sexual organization passes.

The Two Periods of Object Selection. — That the object selection takes place in two periods, or in two shifts, can be spoken of as a typical occurrence. The first shift has its origin between the age of three and five years, and is brought to a stop or to retrogression by the latency period; it is characterized by the infantile nature of its sexual aims. The second shift starts with puberty and determines the definitive formation of the sexual life.

The fact of the double object selection which is essentially due to the effect of the latency period, becomes most significant for the disturbance of this terminal state. The results of the infantile object selection reach into the later period; they are either preserved as such or are even refreshed at the time of puberty. But due to the development of the repression which takes place between the two phases they turn out as unutilizable. The sexual aims have become softened and now represent what we can designate as the *tender* streams of the sexual life. Only psychoanalytic investigation can demonstrate that behind this tenderness, such as honoring and esteeming, there is concealed the old sexual strivings of the infantile partial impulses which have now become useless. The object selection of the pubescent period must renounce the infantile objects and begin anew as a sensuous stream. The fact that the two streams do not meet often enough has as a result that one of the ideals of the sexual life, namely, the union of all desires in one object, can not be attained.

THE SOURCES OF THE INFANTILE SEXUALITY

In our effort to follow up the origins of the sexual impulse, we have thus far found that the sexual excitement originates (*a*) as an imitation of a gratification which has been experienced in conjunction with other organic processes; (*b*) through the appropriate peripheral stimulation of erogenous zones; (*c*) and as an expression of some "impulse," like the looking and cruelty impulses, the origin of which we do not yet fully understand. The psychoanalytic investigation of later life which leads back to childhood and the contemporary observation of the child itself coöperate to reveal to us still other regularly-flowing sources of the sexual excitement. The observation of childhood has the disadvantage of treating easily misunderstood material, while psychoanalysis is made difficult by the fact that it can reach its objects and conclusions only by great detours; still the united efforts of both methods achieve a sufficient degree of positive understanding.

In investigating the erogenous zones we have already found that these skin regions merely show the special exaggeration of a form of sensitiveness which is to a certain degree found over the whole surface of the skin. It will therefore not surprise us to learn that certain forms of general sensitiveness in the skin can be ascribed to very distinct erogenous action. Among these we will above all mention the temperature sensitiveness; this will perhaps prepare us for the understanding of the therapeutic effects of warm baths.

Mechanical Excitation. — We must, moreover, describe here the production of sexual excitation by means of rhythmic mechanical shaking of the body. There are three kinds of exciting influences: those acting on the sensory apparatus of the vestibular nerves, those acting on the skin, and those acting on the deep parts, such as the muscles and joints. The sexual excitation produced by these influences seems to be of a pleasurable nature — it is worth emphasizing that for some time we shall continue to use indiscriminately the terms "sexual excitement" and "gratification" leaving the search for an explanation of the terms to a later time — and that the pleasure is produced by mechanical stimulation is proved by the fact that children are so fond of play involving passive motion, like swinging or flying in the air, and repeatedly demand its

repetition. As we know, rocking is regularly used in putting restless children to sleep. The shaking sensation experienced in wagons and railroad trains exerts such a fascinating influence on older children, that all boys, at least at one time in their lives, want to become conductors and drivers. They are wont to ascribe to railroad activities an extraordinary and mysterious interest, and during the age of phantastic activity (shortly before puberty) they utilize these as a nucleus for exquisite sexual symbolisms. The desire to connect railroad travelling with sexuality apparently originates from the pleasurable character of the sensation of motion. When the repression later sets in and changes so many of the childish likes into their opposites, these same persons as adolescents and adults then react to the rocking and rolling with nausea and become terribly exhausted by a railroad journey, or they show a tendency to attacks of anxiety during the journey, and by becoming obsessed with railroad phobia they protect themselves against a repetition of the painful experiences.

This also fits in with the not as yet understood fact that the concurrence of fear with mechanical shaking produces the severest hysterical forms of traumatic neurosis. It may at least be assumed that inasmuch as even a slight intensity of these influences becomes a source of sexual excitement, the action of an excessive amount of the same will produce a profound disorder in the sexual mechanism.

Muscular Activity. — It is well known that the child has need for strong muscular activity, from the gratification of which it draws extraordinary pleasure. Whether this pleasure has anything to do with sexuality, whether it includes in itself sexual satisfaction? or can be the occasion of sexual excitement; all this may be refuted by critical consideration, which will probably be directed also to the position taken above that the pleasure in the sensations of passive movement are of sexual character or that they are sexually exciting. The fact remains, however, that a number of persons report that they experienced the first signs of excitement in their genitals during fighting or wrestling with playmates, in which situation, besides the general muscular exertion, there is an intensive contact with the opponent’s skin which also becomes effective. The desire for muscular contest with a definite person, like the desire for word contest in later years, is a good sign that the object selection has been directed toward this person. “Was sich liebt, das neckt

sich." In the promotion of sexual excitement through muscular activity we might recognize one of the sources of the sadistic impulse. The infantile connection between fighting and sexual excitement acts in many persons as a determinant for the future preferred course of their sexual impulse.

Affective Processes. — The other sources of sexual excitement in the child are open to less doubt. Through contemporary observations, as well as through later investigations, it is easy to ascertain that all more intensive affective processes, even excitements of a terrifying nature, encroach upon sexuality; this can at all events furnish us with a contribution to the understanding of the pathogenic action of such emotions. In the school child, fear of a coming examination or exertion expended in the solution of a difficult task can become significant for the breaking through of sexual manifestations as well as for his relations to the school, inasmuch as under such excitements a sensation often occurs urging him to touch the genitals, or leading to a pollution-like process with all its disagreeable consequences. The behavior of children at school, which is so often mysterious to the teacher, ought surely to be considered in relation with their germinating sexuality. The sexually-exciting influence of some painful affects, such as fear, shuddering, and horror, is felt by a great many people throughout life and readily explains why so many seek opportunities to experience such sensations, provided that certain accessory circumstances (as under imaginary circumstances in reading, or in the theater) suppress the earnestness of the painful feeling.

If we might assume that the same erogenous action also reaches the intensive painful feelings, especially if the pain be toned down or held at a distance by a subsidiary determination, this relation would then contain the main roots of the masochistic-sadistic impulse, into the manifold composition of which we are gaining a gradual insight.

Intellectual Work. — Finally, is is evident that mental application or the concentration of attention on an intellectual accomplishment will result, especially often in youthful persons, but in older persons as well, in a simultaneous sexual excitement, which may be looked upon as the only justified basis for the otherwise so doubtful etiology of nervous disturbances from mental "overwork."

If we now, in conclusion, review the evidences and indications of the sources of the infantile sexual excitement, which have been reported neither completely nor exhaustively, we may lay down the following

general laws as suggested or established. It seems to be provided in the most generous manner that the process of sexual excitement — the nature of which certainly remains quite mysterious to us — should be set in motion. The factor making this provision in a more or less direct way is the excitation of the sensible surfaces of the skin and sensory organs, while the most immediate exciting influences are exerted on certain parts which are designated as erogenous zones. The criterion in all these sources of sexual excitement is really the quality of the stimuli, though the factor of intensity (in pain) is not entirely unimportant. But in addition to this there are arrangements in the organism which induce sexual excitement as a subsidiary action in a large number of inner processes as soon as the intensity of these processes has risen above certain quantitative limits. What we have designated as the partial impulses of sexuality are either directly derived from these inner sources of sexual excitation or composed of contributions from such sources and from erogenous zones. It is possible that nothing of any considerable significance occurs in the organism that does not contribute its components to the excitement of the sexual impulse.

It seems to me at present impossible to shed more light and certainty on these general propositions, and for this I hold two factors responsible; first, the novelty of this manner of investigation, and secondly, the fact that the nature of the sexual excitement is entirely unfamiliar to us. Nevertheless, I will not forbear speaking about two points which promise to open wide prospects in the future.

Diverse Sexual Constitutions. — (*a*) We have considered above the possibility of establishing the manifold character of congenital sexual constitutions through the diverse formation of the erogenous zones; we may now attempt to do the same in dealing with the indirect sources of sexual excitement. We may assume that, although these different sources furnish contributions in all individuals, they are not all equally strong in all persons; and that a further contribution to the differentiation of the diverse sexual constitution will be found in the preferred developments of the individual sources of sexual excitement.

The Paths of Opposite Influences. — (*b*) Since we are now dropping the figurative manner of expression hitherto employed, by which we spoke of *sources* of sexual excitement, we may now assume that all the connecting ways leading from other functions to sexuality must also be

passable in the reverse direction. For example, if the lip zone, the common possession of both functions, is responsible for the fact that the sexual gratification originates during the taking of nourishment, the same factor offers also an explanation for the disturbances in the taking of nourishment if the erogenous functions of the common zone are disturbed. As soon as we know that concentration of attention may produce sexual excitement, it is quite natural to assume that acting on the same path, but in a contrary direction, the state of sexual excitement will be able to influence the availability of the voluntary attention. A good part of the symptomatology of the neuroses which I trace to disturbance of sexual processes manifests itself in disturbances of the other non-sexual bodily functions, and this hitherto incomprehensible action becomes less mysterious if it only represents the counterpart of the influences controlling the production of the sexual excitement.

However the same paths through which sexual disturbances encroach upon the other functions of the body must in health be supposed to serve another important function. It must be through these paths that the attraction of the sexual motive-powers to other than sexual aims, the sublimation of sexuality, is accomplished. We must conclude with the admission that very little is definitely known concerning the paths beyond the fact that they exist, and that they are probably passable in both directions.

Note 1: For it is really impossible to have a correct knowledge of the part belonging to heredity without first understanding the part belonging to the infantile.

Note 2: This assertion on revision seemed even to myself so bold that I decided to test its correctness by again reviewing the literature. The result of this second review did not warrant any change in my original statement. The scientific elaboration of the physical as well as the psychic phenomena of the infantile sexuality is still in its initial stages. One author (S. Bell, “A Preliminary Study of the Emotions of Love Between the Sexes,” American Journal of Psychology, XIII, 1902) says: “I know of no scientist who has given a careful analysis of the emotion as it is seen in the adolescent.” The only attention given to somatic sexual manifestations occurring before the age of puberty was in connection with degenerative manifestations, and these were referred to as a sign of degeneration. A chapter on the sexual life of children is not to be found in all the

representative psychologies of this age which I have read. Among these works I can mention the following: Preyer; Baldwin (The Development of the Mind in the Child and in the Race, 1898); Pérez (L'enfant de 3-7 ans, 1894); Strümpel (Die pädagogische Pathologie, 1899); Karl Groos (Das Seelenleben des Kindes, 1904); Th. Heller (Grundriss der Heilpädagogic, 1904); Sully (Observations Concerning Childhood, 1897). The best impression of the present situation of this sphere can be obtained from the journal Die Kinderfehler (issued since 1896). On the other hand one gains the impression that the existence of love in childhood is in no need of demonstration. Pérez (l.c.) speaks for it; K. Groos (Die Spiele der Menschen, 1899) states that some children are very early subject to sexual emotions, and show a desire to touch the other sex (); S. Bell observed the earliest appearance of sex-love in a child during the middle part of its third year. See also Havelock Ellis, The Sexual Impulse, Appendix II.

The above-mentioned judgment concerning the literature of infantile sexuality no longer holds true since the appearance of the great and important work of G. Stanley Hall (Adolescence, Its Psychology and its Relation to Physiology, Anthropology, Sociology, Sex, Crime, Religion, and Education, 2 vols., New York, 1908). The recent book of A. Moll, Das Sexualleben des Kindes, Berlin, 1909, offers no occasion for such a modification. See, on the other hand, Bleuler, Sexuelle abnormitäten der Kinder (Jahrbuch der Schweizerischen Gesellschaft für Schulgesundheitspflege, IX, 1908). A book by Mrs. Dr. H.v. Hug-Hellmuth, Aus dem Seelenleben des Kindes (1913), has taken full account of the neglected sexual factors. [Translated in Monograph Series.]

Note 3: I have attempted to solve the problems presented by the earliest infantile recollections in a paper, "Über Deckerinnerungen" (Monatsschrift für Psychiatrie und Neurologie, VI, 1899). Cf. also The Psychopathology of Everyday Life, The Macmillan Co., New York, and Unwin, London.

Note 4: One cannot understand the mechanism of repression when one takes into consideration only one of the two cooperating processes. As a comparison one may think of the way the tourist is despatched to the top of the great pyramid of Gizeh; he is pushed from one side and pulled from the other.

Note 5: The use of the latter material is justified by the fact that the years of childhood of those who are later neurotics need not necessarily

differ from those who are later normal except in intensity and distinctness.

Note 6: An anatomic analogy to the behavior of the infantile sexual function formulated by me is perhaps given by Bayer (Deutsches Archiv für klinische Medizin, Bd. 73) who claims that the internal genitals (uterus) are regularly larger in newborn than in older children. However, Halban's conception, that after birth there is also an involution of the other parts of the sexual apparatus, has not been verified. According to Halban (Zeitschrift für Geburtshilfe u. Gynäkologie, LIII, 1904) this process of involution ends after a few weeks of extra-uterine life.

Note 7: The expression "sexual latency period" (sexuelle latenz-periode) I have borrowed from W. Fliess.

Note 8: In the case here discussed the sublimation of the sexual motive powers proceed on the road of reaction formations. But in general it is necessary to separate from each other sublimation and reaction formation as two diverse processes. Sublimation may also result through other and simpler mechanisms.

Note 9: Jahrbuch für Kinderheilkunde, N.F., XIV, 1879.

Note 10: This already shows what holds true for the whole life, namely, that sexual gratification is the best hypnotic. Most nervous insomnias are traced to lack of sexual gratification. It is also known that unscrupulous nurses calm crying children to sleep by stroking their genitals.

Note 11: Ellis spoils, however, the sense of his invented term by comprising under the phenomena of autoerotism the whole of hysteria and masturbation in its full extent.

Note 12: Further reflection and observation lead me to attribute the quality of erogenity to all parts of the body and inner organs. See later on narcism.

Note 13: Compare here the very comprehensive but confusing literature on onanism, *e.g.*, Rohleder, Die Masturbation, 1899. Cf. also the pamphlet, "Die Onanie," which contains the discussion of the Vienna Psychoanalytic Society, Wiesbaden, 1912.

Note 14: Compare here the essay on "Charakter und Analerotic" in the Sammlung kleiner Schriften zur Neurosenlehre, Zweite Folge, 1909. Cf. also Brill, Psychanalysis, Chap. XIII, Anal Eroticism and Character, W.B. Saunders, Philadelphia.

Note 15: Unusual techniques in the performance of onanism seem to point to the influence of a prohibition against onanism which has been

overcome.

Note 16: Why neurotics, when conscience stricken, regularly connect it with their onanistic activity, as was only recently recognized by Bleuler, is a problem which still awaits an exhaustive analysis.

Note 17: Freud, Selected Papers on Hysteria and Other Psychoneuroses, 3d edition, translated by A.A. Brill, N.Y. Nerv. and Ment. Dis. Pub. Co. Nervous and Mental Disease Monograph, Series No. 4.

Note 18: Havelock Ellis, in an appendix to his study on the Sexual Impulse, 1903, gives a number of autobiographic reports of normal persons treating their first sexual feelings in childhood and the causes of the same. These reports naturally show the deficiency due to infantile amnesia; they do not cover the prehistoric time in the sexual life and therefore must be supplemented by psychoanalysis of individuals who became neurotic. Notwithstanding this these reports are valuable in more than one respect, and information of a similar nature has urged me to modify my etiological assumption as mentioned in the text.

Note 19: The above-mentioned assertions concerning the infantile sexuality were justified in 1905, in the main through the results of psychoanalytic investigations in adults. Direct observation of the child could not at the time be utilized to its full extent and resulted only in individual indications and valuable confirmations. Since then it has become possible through the analysis of some cases of nervous disease in the delicate age of childhood to gain a direct understanding of the infantile psychosexuality (Jahrbuch für psychoanalytische und psychopathologische Forschungen, Bd. 1, 2, 1909). I can point with satisfaction to the fact that direct observation has fully confirmed the conclusion drawn from psychoanalysis, and thus furnishes good evidence for the reliability of the latter method of investigation.

Moreover, the “Analysis of a Phobia in a Five-year-old Boy” (Jahrbuch, Bd. 1) has taught us something new for which psychoanalysis had not prepared us, to wit, that sexual symbolism, the representation of the sexual by non-sexual objects and relations — reaches back into the years when the child is first learning to master the language. My attention has also been directed to a deficiency in the above-cited statement which for the sake of clearness described any conceivable separation between the two phases of autoerotism and object love as a temporal separation. From the cited analysis (as well as from the above-mentioned work of Bell) we

learn that children from three to five are capable of evincing a very strong object-selection which is accompanied by strong affects.

Note 20: Some persons can recall that the contact of the moving air in swinging caused them direct sexual pleasure in the genitals.

Note 21: “Those who love each other tease each other.”

Note 22: The analyses of neurotic disturbances of walking and of agoraphobia remove all doubt as to the sexual nature of the pleasure of motion. As everybody knows modern cultural education utilizes sports to a great extent in order to turn away the youth from sexual activity; it would be more proper to say that it replaces the sexual pleasure by motion pleasure, and forces the sexual activity back upon one of its autoerotic components.

III. THE TRANSFORMATION OF PUBERTY

With the beginning of puberty the changes set in which transform the infantile sexual life into its definite normal form. Hitherto the sexual impulse has been preponderantly autoerotic; it now finds the sexual object. Thus far it has manifested itself in single impulses and in erogenous zones seeking a certain pleasure as a single sexual aim. A new sexual aim now appears for the production of which all partial impulses coöperate, while the erogenous zones subordinate themselves to the primacy of the genital zone. As the new sexual aim assigns very different functions to the two sexes their sexual developments now part company. The sexual development of the man is more consistent and easier to understand, while in the woman there even appears a form of regression. The normality of the sexual life is guaranteed only by the exact concurrence of the two streams directed to the sexual object and sexual aim. It is like the piercing of a tunnel from opposite sides.

The new sexual aim in the man consists in the discharging of the sexual products; it is not contradictory to the former sexual aim, that of obtaining pleasure; on the contrary, the highest amount of pleasure is connected with this final act in the sexual process. The sexual impulse now enters into the service of the function of propagation; it becomes, so to say, altruistic. If this transformation is to succeed its process must be adjusted to the original dispositions and all the peculiarities of the impulses.

Just as on every other occasion where new connections and compositions are to be formed in complicated mechanisms, here, too, there is a possibility for morbid disturbance if the new order of things does not get itself established. All morbid disturbances of the sexual life may justly be considered as inhibitions of development.

THE PRIMACY OF THE GENITAL ZONES AND THE FORE-PLEASURE

From the course of development as described we can clearly see the issue and the end aim. The intermediary transitions are still quite obscure and many a riddle will have to be solved in them.

The most striking process of puberty has been selected as its most characteristic; it is the manifest growth of the external genitals which have shown a relative inhibition of growth during the latency period of childhood. Simultaneously the inner genitals develop to such an extent as to be able to furnish sexual products or to receive them for the purpose of forming a new living being. A most complicated apparatus is thus formed which waits to be claimed.

This apparatus can be set in motion by stimuli, and observation teaches that the stimuli can affect it in three ways: from the outer world through the familiar erogenous zones; from the inner organic world by ways still to be investigated; and from the psychic life, which merely represents a depository of external impressions and a receptacle of inner excitations. The same result follows in all three cases, namely, a state which can be designated as “sexual excitation” and which manifests itself in psychic and somatic signs. The psychic sign consists in a peculiar feeling of tension of a most urgent character, and among the manifold somatic signs the many changes in the genitals stand first. They have a definite meaning, that of readiness; they constitute a preparation for the sexual act (the erection of the penis and the glandular activity of the vagina).

The Sexual Tension — The character of the tension of sexual excitation is connected with a problem the solution of which is as difficult as it would be important for the conception of the sexual process. Despite all divergence of opinion regarding it in psychology, I must firmly maintain that a feeling of tension must carry with it the character of displeasure. For me it is conclusive that such a feeling carries with it the impulse to alter the psychic situation, and acts incitingly, which is quite contrary to the nature of perceived pleasure. But if we ascribe the tension of the sexual excitation to the feelings of displeasure we encounter the fact that it is undoubtedly pleasurably perceived. The tension produced by sexual excitation is everywhere accompanied by pleasure; even in the

preparatory changes of the genitals there is a distinct feeling of satisfaction. What relation is there between this unpleasant tension and this feeling of pleasure?

Everything relating to the problem of pleasure and pain touches one of the weakest spots of present-day psychology. We shall try if possible to learn something from the determinations of the case in question and to avoid encroaching on the problem as a whole. Let us first glance at the manner in which the erogenous zones adjust themselves to the new order of things. An important rôle devolves upon them in the preparation of the sexual excitation. The eye which is very remote from the sexual object is most often in position, during the relations of object wooing, to become attracted by that particular quality of excitation, the motive of which we designate as beauty in the sexual object. The excellencies of the sexual object are therefore also called “attractions.” This attraction is on the one hand already connected with pleasure, and on the other hand it either results in an increase of the sexual excitation or in an evocation of the same where it is still wanting. The effect is the same if the excitation of another erogenous zone, *e.g.*, the touching hand, is added to it. There is on the one hand the feeling of pleasure which soon becomes enhanced by the pleasure from the preparatory changes, and on the other hand there is a further increase of the sexual tension which soon changes into a most distinct feeling of displeasure if it cannot proceed to more pleasure. Another case will perhaps be clearer; let us, for example, take the case where an erogenous zone, like a woman’s breast, is excited by touching in a person who is not sexually excited at the time. This touching in itself evokes a feeling of pleasure, but it is also best adapted to awaken sexual excitement which demands still more pleasure. How it happens that the perceived pleasure evokes the desire for greater pleasure, that is the real problem.

Fore-pleasure Mechanism. — But the rôle which devolves upon the erogenous zones is clear. What applies to one applies to all. They are all utilized to furnish a certain amount of pleasure through their own proper excitation, which increases the tension, and which is in turn destined to produce the necessary motor energy in order to bring to a conclusion the sexual act. The last part but one of this act is again a suitable excitation of an erogenous zone; *i.e.*, the genital zone proper of the glans penis is excited by the object most fit for it, the mucous membrane of the vagina,

and through the pleasure furnished by this excitation it now produces reflexly the motor energy which conveys to the surface the sexual substance. This last pleasure is highest in its intensity, and differs from the earliest ones in its mechanism. It is altogether produced through discharge, it is altogether gratification pleasure and the tension of the libido temporarily dies away with it.

It does not seem to me unjustified to fix by name the distinction in the nature of these pleasures, the one through the excitation of the erogenous zones, and the other through the discharge of the sexual substance. In contradistinction to the end-pleasure, or pleasure of gratification of sexual activity, we can properly designate the first as *fore-pleasure*. The fore-pleasure is then the same as that furnished by the infantile sexual impulse, though on a reduced scale; while the *end-pleasure* is new and is probably connected with determinations which first appear at puberty. The formula for the new function of the erogenous zones reads as follows: they are utilized for the purpose of making possible the production of the greater pleasure of gratification by means of the fore-pleasure which is gained from them as in infantile life.

I have recently been able to elucidate another example from a quite different realm of the psychic life, in which likewise a greater feeling of pleasure is achieved by means of a lesser feeling of pleasure which thereby acts as an alluring premium. We had there also the opportunity of entering more deeply into the nature of pleasure.

Dangers of the Fore-pleasure. — However the connection of fore-pleasure with the infantile life is strengthened by the pathogenic rôle which may devolve upon it. In the mechanism through which the fore-pleasure is expressed there exists an obvious danger to the attainment of the normal sexual aim. This occurs if it happens that there is too much fore-pleasure and too little tension in any part of the preparatory sexual process. The motive power for the further continuation of the sexual process then escapes, the whole road becomes shortened, and the preparatory action in question takes the place of the normal sexual aim. Experience shows that such a hurtful condition is determined by the fact that the erogenous zone concerned or the corresponding partial impulse has already contributed an unusual amount of pleasure in infantile life. If other factors favoring fixation are added a compulsion readily results for the later life which prevents the fore-pleasure from arranging itself into a

new combination. Indeed, the mechanism of many perversions is of such a nature; they merely represent a lingering at a preparatory act of the sexual process.

The failure of the function of the sexual mechanism through the fault of the fore-pleasure is generally avoided if the primacy of the genital zones has also already been sketched out in infantile life. The preparations of the second half of childhood (from the eighth year to puberty) really seem to favor this. During these years the genital zones behave almost as at the age of maturity; they are the seat of exciting sensations and of preparatory changes if any kind of pleasure is experienced through the gratification of other erogenous zones; although this effect remains aimless, *i.e.*, it contributes nothing towards the continuation of the sexual process. Besides the pleasure of gratification a certain amount of sexual tension appears even in infancy, though it is less constant and less abundant. We can now understand also why in the discussion of the sources of sexuality we had a perfectly good reason for saying that the process in question acts as sexual gratification as well as sexual excitement. We note that on our way towards the truth we have at first enormously exaggerated the distinctions between the infantile and the mature sexual life, and we therefore supplement what has been said with a correction. The infantile manifestations of sexuality determine not only the deviations from the normal sexual life but also the normal formations of the same.

THE PROBLEM OF SEXUAL EXCITEMENT

It remains entirely unexplained whence the sexual tension comes which originates simultaneously with the gratification of erogenous zones and what is its nature. The obvious supposition that this tension originates in some way from the pleasure itself is not only improbable in itself but untenable, inasmuch as during the greatest pleasure which is connected with the voiding of sexual substance there is no production of tension but rather a removal of all tension. Hence, pleasure and sexual tension can be only indirectly connected.

The Rôle of the Sexual Substance. — Aside from the fact that only the discharge of the sexual substance can normally put an end to the sexual excitement, there are other essential facts which bring the sexual tension into relation with the sexual products. In a life of continence the sexual activity is wont to discharge the sexual substance at night during pleasurable dream hallucinations of a sexual act, this discharge coming at changing but not at entirely capricious intervals; and the following interpretation of this process — the nocturnal pollution — can hardly be rejected, viz., that the sexual tension which brings about a substitute for the sexual act by the short hallucinatory road is a function of the accumulated semen in the reservoirs for the sexual products. Experiences with the exhaustibility of the sexual mechanism speak for the same thing. Where there is no stock of semen it is not only impossible to accomplish the sexual act, but there is also a lack of excitability in the erogenous zones, the suitable excitation of which can evoke no pleasure. We thus discover incidentally that a certain amount of sexual tension is itself necessary for the excitability of the erogenous zones.

One would thus be forced to the assumption, which if I am not mistaken is quite generally adopted, that the accumulation of sexual substance produces and maintains the sexual tension. The pressure of these products on the walls of their receptacles acts as an excitant on the spinal center, the state of which is then perceived by the higher centers which then produce in consciousness the familiar feeling of tension. If the excitation of erogenous zones increases the sexual tension, it can only be due to the fact that the erogenous zones are connected with these centers by previously formed anatomical connections. They increase there the tone of the

excitation, and with sufficient sexual tension they set in motion the sexual act, and with insufficient tension they merely stimulate a production of the sexual substance.

The weakness of the theory which one finds adopted, *e.g.*, in v. Krafft-Ebing's description of the sexual process, lies in the fact that it has been formed for the sexual activity of the mature man and pays too little heed to three kinds of relations which should also have been elucidated. We refer to the relations as found in the child, in the woman, and in the castrated male. In none of the three cases can we speak of an accumulation of sexual products in the same sense as in the man, which naturally renders difficult the general application of this scheme; still it may be admitted without any further ado that ways can be found to justify the subordination of even these cases. Nevertheless one should be cautious about burdening the factor of accumulation of sexual products with actions which it seems incapable of supporting.

Overestimation of the Internal Genitals. — That sexual excitement can be independent to a considerable extent of the production of sexual substance seems to be shown by observations on castrated males, in whom the libido sometimes escapes the injury caused by the operation, although the opposite behavior, which is really the motive for the operation, is usually the rule. It is therefore not at all surprising, as C. Rieger puts it, that the loss of the male germ glands in maturer age should exert no new influence on the psychic life of the individual. The germ glands are really not the sexuality, and the experience with castrated males only verifies what we had long before learned from the removal of the ovaries, namely that it is impossible to do away with the sexual character by removing the germ glands. To be sure, castration performed at a tender age, before puberty, comes nearer to this aim, but it would seem in this case that besides the loss of the sexual glands we must also consider the inhibition of development and other factors which are connected with that loss.

Chemical Theories. — The truth remains, however, that we are unable to give any information about the nature of the sexual excitement for the reason that we do not know with what organ or organs sexuality is connected, since we have seen that the sexual glands have been overestimated in this significance. Since surprising discoveries have taught us the important rôle of the thyroid gland in sexuality, we may assume that the knowledge of the essential factors of sexuality are still

withheld from us. One who feels the need of filling up the large gap in our knowledge with a preliminary assumption may formulate for himself the following theory based on the active substances found in the thyroid. Through the appropriate excitement of erogenous zones, as well as through other conditions under which sexual excitement originates, a material which is universally distributed in the organism becomes disintegrated, the decomposing products of which supply a specific stimulus to the organs of reproduction or to the spinal center connected with them. Such a transformation of a toxic stimulus in a particular organic stimulus we are already familiar with from other toxic products introduced into the body from without. To treat, if only hypothetically, the complexities of the pure toxic and the physiologic stimulations which result in the sexual processes is not now our appropriate task. To be sure, I attach no value to this special assumption and I shall be quite ready to give it up in favor of another, provided its original character, the emphasis on the sexual chemism, were preserved. For this apparently arbitrary statement is supported by a fact which, though little heeded, is most noteworthy. The neuroses which can be traced only to disturbances of the sexual life show the greatest clinical resemblance to the phenomena of intoxication and abstinence which result from the habitual introduction of pleasure-producing poisonous substances (alkaloids.)

THE THEORY OF THE LIBIDO

These assumptions concerning the chemical basis of the sexual excitement are in full accord with the auxiliary conception which we formed for the purpose of mastering the psychic manifestations of the sexual life. We have determined the concept of *libido* as that of a force of variable quantity which has the capacity of measuring processes and transformations in the spheres of sexual excitement. This libido we distinguished from the energy which is to be generally adjudged to the psychic processes with reference to its special origin and thus we attribute to it also a qualitative character. In separating libidinous from other psychic energy we give expression to the assumption that the sexual processes of the organism are differentiated from the nutritional processes through a special chemism. The analyses of perversions and psychoneuroses have taught us that this sexual excitement is furnished not only from the so-called sexual parts alone but from all organs of the body. We thus formulate for ourselves the concept of a libido-quantum whose psychic representative we designate as the ego-libido; the production, increase, distribution and displacement of this ego-libido will offer the possible explanation for the observed psycho-sexual phenomena.

But this ego-libido becomes conveniently accessible to psychoanalytic study only when the psychic energy is employed on sexual objects, that is when it becomes object libido. Then we see it as it concentrates and fixes itself on objects, or as it leaves those objects and passes over to others from which positions it directs the individual's sexual activity, that is, it leads to partial and temporary extinction of the libido. Psychoanalysis of the so-called transference neuroses (hysteria and compulsion neurosis) offers us here a reliable insight.

Concerning the fates of the object libido we also state that it is withdrawn from the object, that it is preserved floating in special states of tension and is finally taken back into the ego, so that it again becomes ego-libido. In contradistinction to the object-libido we also call the ego-libido narcissistic libido. From psychoanalysis we look over the boundary which we are not permitted to pass into the activity of the narcissistic libido and thus form an idea of the relations between the two. The narcissistic or ego-libido appears to us as the great reservoir from which

the energy for the investment of the object is sent out and into which it is drawn back again, while the narcissistic libido investment of the ego appears to us as the realized primitive state in the first childhood, which only becomes hidden by the later emissions of the libido, and is retained at the bottom behind them.

The task of a theory of libido of neurotic and psychotic disturbances would have for its object to express in terms of the libido-economy all observed phenomena and disclosed processes. It is easy to divine that the greater significance would attach thereby to the destinies of the ego-libido, especially where it would be the question of explaining the deeper psychotic disturbances. The difficulty then lies in the fact that the means of our investigation, psychoanalysis, at present gives us definite information only concerning the transformation of the object-libido, but cannot distinguish without further study the ego-libido from the other effective energies in the ego.

DIFFERENTIATION BETWEEN MAN AND WOMAN

It is known that the sharp differentiation of the male and female character originates at puberty, and it is the resulting difference which, more than any other factor, decisively influences the later development of personality. To be sure, the male and female dispositions are easily recognizable even in infantile life; thus the development of sexual inhibitions (shame, loathing, sympathy, etc.) ensues earlier and with less resistance in the little girl than in the little boy. The tendency to sexual repression certainly seems much greater, and where partial impulses of sexuality are noticed they show a preference for the passive form. But, the autoerotic activity of the erogenous zones is the same in both sexes, and it is this agreement that removes the possibility of a sex differentiation in childhood as it appears after puberty. In respect to the autoerotic and masturbatic sexual manifestations, it may be asserted that the sexuality of the little girl has entirely a male character. Indeed, if one could give a more definite content to the terms "masculine and feminine," one might advance the opinion that *the libido is regularly and lawfully of a masculine nature, whether in the man or in the woman; and if we consider its object, this may be either the man or the woman*.

Since becoming acquainted with the aspect of bisexuality I hold this factor as here decisive, and I believe that without taking into account the factor of bisexuality it will hardly be possible to understand the actually observed sexual manifestations in man and woman.

The Leading Zones in Man and Woman. — Further than this I can only add the following. The chief erogenous zone in the female child is the clitoris, which is homologous to the male penis. All I have been able to discover concerning masturbation in little girls concerned the clitoris and not those other external genitals which are so important for the later sexual functions. With few exceptions I myself doubt whether the female child can be seduced to anything but clitoris masturbation. The frequent spontaneous discharges of sexual excitement in little girls manifest themselves in a twitching of the clitoris, and its frequent erections enable the girl to understand correctly even without any instruction the sexual manifestations of the other sex; they simply transfer to the boys the sensations of their own sexual processes.

If one wishes to understand how the little girl becomes a woman, he must follow up the further destinies of this clitoris excitation. Puberty, which brings to the boy a great advance of libido, distinguishes itself in the girl by a new wave of repression which especially concerns the clitoris sexuality. It is a part of the male sexual life that sinks into repression. The reënforcement of the sexual inhibitions produced in the woman by the repression of puberty causes a stimulus in the libido of the man and forces it to increase its capacity; with the height of the libido there is a rise in the overestimation of the sexual, which can be present in its full force only when the woman refuses and denies her sexuality. If the sexual act is finally submitted to and the clitoris becomes excited its rôle is then to conduct the excitement to the adjacent female parts, and in this it acts like a chip of pine wood which is utilized to set fire to the harder wood. It often takes some time for this transference to be accomplished; during which the young wife remains anesthetic. This anesthesia may become permanent if the clitoris zone refuses to give up its excitability; a condition brought on by abundant activities in infantile life. It is known that anesthesia in women is often only apparent and local. They are anesthetic at the vaginal entrance but not at all unexcitable through the clitoris or even through other zones. Besides these erogenous causes of anesthesia there are also psychic causes likewise determined by the repression.

If the transference of the erogenous excitability from the clitoris to the vagina has succeeded, the woman has thus changed her leading zone for the future sexual activity; the man on the other hand retains his from childhood. The main determinants for the woman’s preference for the neuroses, especially for hysteria, lie in this change of the leading zone as well as in the repression of puberty. These determinants are therefore most intimately connected with the nature of femininity.

THE OBJECT-FINDING

While the primacy of the genital zones is being established through the processes of puberty, and the erected penis in the man imperiously points towards the new sexual aim, *i.e.*, towards the penetration of a cavity which excites the genital zone, the object-finding, for which also preparations have been made since early childhood, becomes consummated on the psychic side. While the very incipient sexual gratifications are still connected with the taking of nourishment, the sexual impulse has a sexual object outside its own body in his mother's breast. This object it loses later, perhaps at the very time when it becomes possible for the child to form a general picture of the person to whom the organ granting him the gratification belongs. The sexual impulse later regularly becomes autoerotic, and only after overcoming the latency period is there a resumption of the original relation. It is not without good reason that the suckling of the child at its mother's breast has become a model for every amour. The object-finding is really a re-finding.

The Sexual Object of the Nursing Period. — However, even after the separation of the sexual activity from the taking of nourishment, there still remains from this first and most important of all sexual relations an important share, which prepares the object selection and assists in reestablishing the lost happiness. Throughout the latency period the child learns to love other persons who assist it in its helplessness and gratify its wants; all this follows the model and is a continuation of the child's infantile relations to his wet nurse. One may perhaps hesitate to identify the tender feelings and esteem of the child for his foster-parents with sexual love; I believe, however, that a more thorough psychological investigation will establish this identity beyond any doubt. The intercourse between the child and its foster-parents is for the former an inexhaustible source of sexual excitation and gratification of erogenous zones, especially since the parents — or as a rule the mother — supplies the child with feelings which originate from her own sexual life; she pats it, kisses it, and rocks it, plainly taking it as a substitute for a full-valued sexual object. The mother would probably be terrified if it were explained to her that all her tenderness awakens the sexual impulse of her child and prepares its future intensity. She considers her actions as asexually "pure"

love, for she carefully avoids causing more irritation to the genitals of the child than is indispensable in caring for the body. But as we know the sexual impulse is not awakened by the excitation of genital zones alone. What we call tenderness will some day surely manifest its influence on the genital zones also. If the mother better understood the high significance of the sexual impulse for the whole psychic life and for all ethical and psychic activities, the enlightenment would spare her all reproaches. By teaching the child to love she only fulfills her function; for the child should become a fit man with energetic sexual needs, and accomplish in life all that the impulse urges the man to do. Of course, too much parental tenderness becomes harmful because it accelerates the sexual maturity, and also because it "spoils" the child and makes it unfit to temporarily renounce love or be satisfied with a smaller amount of love in later life. One of the surest premonitions of later nervousness is the fact that the child shows itself insatiable in its demands for parental tenderness; on the other hand, neuropathic parents, who usually display a boundless tenderness, often with their caressing awaken in the child a disposition for neurotic diseases. This example at least shows that neuropathic parents have nearer ways than inheritance by which they can transfer their disturbances to their children.

Infantile Fear. — The children themselves behave from their early childhood as if their attachment to their foster-parents were of the nature of sexual love. The fear of children is originally nothing but an expression for the fact that they miss the beloved person. They therefore meet every stranger with fear, they are afraid of the dark because they cannot see the beloved person, and are calmed if they can grasp that person's hand. The effect of childish fears and of the terrifying stories told by nurses is overestimated if one blames the latter for producing the fear in children. Children who are predisposed to fear absorb these stories, which make no impression whatever upon others; and only such children are predisposed to fear whose sexual impulse is excessive or prematurely developed, or has become exigent through pampering. The child behaves here like the adult, that is, it changes its libido into fear when it cannot bring it to gratification, and the grown-up who becomes neurotic on account of ungratified libido behaves in his anxiety like a child; he fears when he is alone, *i.e.*, without a person of whose love he believes himself sure, and who can calm his fears by means of the most childish measures.

Incest Barriers. — If the tenderness of the parents for the child has luckily failed to awaken the sexual impulse of the child prematurely, *i.e.*, before the physical determinations for puberty appear, and if that awakening has not gone so far as to cause an unmistakable breaking through of the psychic excitement into the genital system, it can then fulfill its task and direct the child at the age of maturity in the selection of the sexual object. It would, of course, be most natural for the child to select as the sexual object that person whom it has loved since childhood with, so to speak, a suppressed libido. But owing to the delay of sexual maturity time has been gained for the erection beside the sexual inhibitions of the incest barrier, that moral prescription which explicitly excludes from the object selection the beloved person of infancy or blood relation. The observance of this barrier is above all a demand of cultural society which must guard against the absorption by the family of those interests which it needs for the production of higher social units. Society, therefore, uses every means to loosen those family ties in every individual, especially in the boy, which are authoritative in childhood only.

The object selection, however, is first accomplished in the imagination, and the sexual life of the maturing youth has hardly any escape except indulgence in phantasies or ideas which are not destined to be brought to execution. In the phantasies of all persons the infantile inclinations, now reënforced by somatic emphasis, reappear, and among them one finds in regular frequency and in the first place the sexual feeling of the child for the parents. This has usually already been differentiated by the sexual attraction, the attraction of the son for the mother and of the daughter for the father. Simultaneously with the overcoming and rejection of these distinctly incestuous phantasies there occurs one of the most important as well as one of the most painful psychic accomplishments of puberty; it is the breaking away from the parental authority, through which alone is formed that opposition between the new and old generations which is so important for cultural progress. Many persons are detained at each of the stations in the course of development through which the individual must pass; and accordingly there are persons who never overcome the parental authority and never, or very imperfectly, withdraw their affection from their parents. They are mostly girls, who, to the delight of their parents, retain their full infantile love far beyond puberty, and it is instructive to find that in their married life these girls are incapable of fulfilling their

duties to their husbands. They make cold wives and remain sexually anesthetic. This shows that the apparently non-sexual love for the parents and the sexual love are nourished from the same source, *i.e.*, that the first merely corresponds to an infantile fixation of the libido.

The nearer we come to the deeper disturbances of the psychosexual development the more easily we can recognize the evident significance of the incestuous object-selection. As a result of sexual rejection there remains in the unconscious of the psychoneurotic a great part or the whole of the psychosexual activity for object finding. Girls with an excessive need for affection and an equal horror for the real demands of the sexual life experience an uncontrollable temptation on the one hand to realize in life the ideal of the asexual love and on the other hand to conceal their libido under an affection which they may manifest without self reproach; this they do by clinging for life to the infantile attraction for their parents or brothers or sisters which has been repressed in puberty. With the help of the symptoms and other morbid manifestations, psychoanalysis can trace their unconscious thoughts and translate them into the conscious, and thus easily show to such persons that they are in love with their consanguinous relations in the popular meaning of the term. Likewise when a once healthy person falls sick after an unhappy love affair, the mechanism of the disease can distinctly be explained as a return of his libido to the persons preferred in his infancy.

The After Effects of the Infantile Object Selection. — Even those who have happily eluded the incestuous fixation of their libido have not completely escaped its influence. It is a distinct echo of this phase of development that the first serious love of the young man is often for a mature woman and that of the girl for an older man equipped with authority — *i.e.*, for persons who can revive in them the picture of the mother and father. Generally speaking object selection unquestionably takes place by following more freely these prototypes. The man seeks above all the memory picture of his mother as it has dominated him since the beginning of childhood; this is quite consistent with the fact that the mother, if still living, strives against this, her renewal, and meets it with hostility. In view of this significance of the infantile relation to the parents for the later selection of the sexual object, it is easy to understand that every disturbance of this infantile relation brings to a head the most serious results for the sexual life after puberty. Jealousy of the lover, too,

never lacks the infantile sources or at least the infantile reinforcement. Quarrels between parents and unhappy marital relations between the same determine the severest predispositions for disturbed sexual development or neurotic diseases in the children.

The infantile desire for the parents is, to be sure, the most important, but not the only trace revived in puberty which points the way to the object selection. Other dispositions of the same origin permit the man, still supported by his infancy, to develop more than one single sexual series and to form different determinations for the object selection.

Prevention of Inversion. — One of the tasks imposed in the object selection consists in not missing the opposite sex. This, as we know, is not solved without some difficulty. The first feelings after puberty often enough go astray, though not with any permanent injury. Dessoir has called attention to the normality of the enthusiastic friendships formed by boys and girls with their own sex. The greatest force which guards against a permanent inversion of the sexual object is surely the attraction exerted by the opposite sex characters on each other. For this we can give no explanation in connection with this discussion. This factor, however, does not in itself suffice to exclude the inversion; besides this there are surely many other supporting factors. Above all, there is the authoritative inhibition of society; experience shows that where the inversion is not considered a crime it fully corresponds to the sexual inclinations of many persons. Moreover, it may be assumed that in the man the infantile memories of the mother's tenderness, as well as that of other females who cared for him as a child, energetically assist in directing his selection to the woman, while the early sexual intimidation experienced through the father and the attitude of rivalry existing between them deflects the boy from the same sex. Both factors also hold true in the case of the girl whose sexual activity is under the special care of the mother. This results in a hostile relation to the same sex which decisively influences the object selection in the normal sense. The bringing up of boys by male persons (slaves in the ancient times) seems to favor homosexuality; the frequency of inversion in the present day nobility is probably explained by their employment of male servants, and by the scant care that mothers of that class give to their children. It happens in some hysterics that one of the parents has disappeared (through death, divorce, or estrangement), thus permitting the remaining parent to absorb all the love of the child, and in

this way establishing the determinations for the sex of the person to be selected later as the sexual object; thus a permanent inversion is made possible.

SUMMARY

It is now time to attempt a summing-up. We have started from the aberrations of the sexual impulse in reference to its object and aim and have encountered the question whether these originate from a congenital predisposition, or whether they are acquired in consequence of influences from life. The answer to this question was reached through an examination of the relations of the sexual life of psychoneurotics, a numerous group not very remote from the normal. This examination has been made through psychoanalytic investigations. We have thus found that a tendency to all perversions might be demonstrated in these persons in the form of unconscious forces revealing themselves as symptom creators and we could say that the neurosis is, as it were, the negative of the perversion. In view of the now recognized great diffusion of tendencies to perversion the idea forced itself upon us that the disposition to perversions is the primitive and universal disposition of the human sexual impulse, from which the normal sexual behavior develops in consequence of organic changes and psychic inhibitions in the course of maturity. We hoped to be able to demonstrate the original disposition in the infantile life; among the forces restraining the direction of the sexual impulse we have mentioned shame, loathing and sympathy, and the social constructions of morality and authority. We have thus been forced to perceive in every fixed aberration from the normal sexual life a fragment of inhibited development and infantilism. The significance of the variations of the original dispositions had to be put into the foreground, but between them and the influences of life we had to assume a relation of coöperation and not of opposition. On the other hand, as the original disposition must have been a complex one, the sexual impulse itself appeared to us as something composed of many factors, which in the perversions becomes separated, as it were, into its components. The perversions, thus prove themselves to be on the one hand inhibitions, and on the other dissociations from the normal development. Both conceptions became united in the assumption that the sexual impulse of the adult due to the composition of the diverse feelings of the infantile life became formed into one unit, one striving, with one single aim.

We also added an explanation for the preponderance of perversive tendencies in the psychoneurotics by recognizing in these tendencies collateral fillings of side branches caused by the shifting of the main river bed through repression, and we then turned our examination to the sexual life of the infantile period. We found it regrettable that the existence of a sexual life in infancy has been disputed, and that the sexual manifestations which have been often observed in children have been described as abnormal occurrences. It rather seemed to us that the child brings along into the world germs of sexual activity and that even while taking nourishment it at the same time also enjoys a sexual gratification which it then seeks again to procure for itself through the familiar activity of "thumbsucking." The sexual activity of the child, however, does not develop in the same measure as its other functions, but merges first into the so-called latency period from the age of three to the age of five years. The production of sexual excitation by no means ceases at this period but continues and furnishes a stock of energy, the greater part of which is utilized for aims other than sexual; namely, on the one hand for the delivery of sexual components for social feelings, and on the other hand (by means of repression and reaction formation) for the erection of the future sexual barriers. Accordingly, the forces which are destined to hold the sexual impulse in certain tracks are built up in infancy at the expense of the greater part of the perverse sexual feelings and with the assistance of education. Another part of the infantile sexual manifestations escapes this utilization and may manifest itself as sexual activity. It can then be discovered that the sexual excitation of the child flows from diverse sources. Above all gratifications originate through the adapted sensible excitation of so-called erogenous zones. For these probably any skin region or sensory organ may serve; but there are certain distinguished erogenous zones the excitation of which by certain organic mechanisms is assured from the beginning. Moreover, sexual excitation originates in the organism, as it were, as a by-product in a great number of processes, as soon as they attain a certain intensity; this especially takes place in all strong emotional excitements even if they be of a painful nature. The excitations from all these sources do not yet unite, but they pursue their aim individually — this aim consisting merely in the gaining of a certain pleasure. The sexual impulse of childhood is therefore objectless or *autoerotic*.

Still during infancy the erogenous zone of the genitals begins to make itself noticeable, either by the fact that like any other erogenous zone it furnishes gratification through a suitable sensible stimulus, or because in some incomprehensible way the gratification from other sources causes at the same time the sexual excitement which has a special connection with the genital zone. We found cause to regret that a sufficient explanation of the relations between sexual gratification and sexual excitement, as well as between the activity of the genital zone and the remaining sources of sexuality, was not to be attained.

We were unable to state what amount of sexual activity in childhood might be designated as normal to the extent of being incapable of further development. The character of the sexual manifestation showed itself to be preponderantly masturbatic. We, moreover, verified from experience the belief that the external influences of seduction, might produce premature breaches in the latency period leading as far as the suppression of the same, and that the sexual impulse of the child really shows itself to be polymorphous-perverse; furthermore, that every such premature sexual activity impairs the educability of the child.

Despite the incompleteness of our examinations of the infantile sexual life we were subsequently forced to attempt to study the serious changes produced by the appearance of puberty. We selected two of the same as criteria, namely, the subordination of all other sources of the sexual feeling to the primacy of the genital zones, and the process of object finding. Both of them are already developed in childhood. The first is accomplished through the mechanism of utilizing the fore-pleasure, whereby all other independent sexual acts which are connected with pleasure and excitement become preparatory acts for the new sexual aim, the voiding of the sexual products, the attainment of which under enormous pleasure puts an end to the sexual feeling. At the same time we had to consider the differentiation of the sexual nature of man and woman, and we found that in order to become a woman a new repression is required which abolishes a piece of infantile masculinity, and prepares the woman for the change of the leading genital zones. Lastly, we found the object selection, tracing it through infancy to its revival in puberty; we also found indications of sexual inclinations on the part of the child for the parents and foster-parents, which, however, were turned away from these persons to others resembling them by the incest barriers which had been

erected in the meantime. Let us finally add that during the transition period of puberty the somatic and psychic processes of development proceed side by side, but separately, until with the breaking through of an intense psychic love-stimulus for the innervation of the genitals, the normally demanded unification of the erotic function is established.

The Factors Disturbing the Development. — As we have already shown by different examples, every step on this long road of development may become a point of fixation and every joint in this complicated structure may afford opportunity for a dissociation of the sexual impulse. It still remains for us to review the various inner and outer factors which disturb the development, and to mention the part of the mechanism affected by the disturbance emanating from them. The factors which we mention here in a series cannot, of course, all be in themselves of equal validity and we must expect to meet with difficulties in the assigning to the individual factors their due importance.

Constitution and Heredity. — In the first place, we must mention here the congenital *variation of the sexual constitution*, upon which the greatest weight probably falls, but the existence of which, as may be easily understood, can be established only through its later manifestations and even then not always with great certainty. We understand by it a preponderance of one or another of the manifold sources of the sexual excitement, and we believe that such a difference of disposition must always come to expression in the final result, even if it should remain within normal limits. Of course, we can also imagine certain variations of the original disposition that even without further aid must necessarily lead to the formation of an abnormal sexual life. One can call these “degenerative” and consider them as an expression of hereditary deterioration. In this connection I have to report a remarkable fact. In more than half of the severe cases of hysteria, compulsion neuroses, etc., which I have treated by psychotherapy, I have succeeded in positively demonstrating that their fathers have gone through an attack of syphilis before marriage; they have either suffered from tabes or general paresis, or there was a definite history of lues. I expressly add that the children who were later neurotic showed absolutely no signs of hereditary lues, so that the abnormal sexual constitution was to be considered as the last off-shoot of the luetic heredity. As far as it is now from my thoughts to put down a descent from syphilitic parents as a regular and indispensable etiological

determination of the neuropathic constitution, I nevertheless maintain that the coincidence observed by me is not accidental and not without significance.

The hereditary relations of the positive perverts are not so well known because they know how to avoid inquiry. Still there is reason to believe that the same holds true in the perversions as in the neuroses. We often find perversions and psychoneuroses in the different sexes of the same family, so distributed that the male members, or one of them, is a positive pervert, while the females, following the repressive tendencies of their sex, are negative perverts or hysterics. This is a good example of the substantial relations between the two disturbances which I have discovered.

Further Elaboration. — It cannot, however, be maintained that the structure of the sexual life is rendered finally complete by the addition of the diverse components of the sexual constitution. On the contrary, qualifications continue to appear and new possibilities result, depending upon the fate experienced by the sexual streams originating from the individual sources. This *further elaboration* is evidently the final and decisive one while the constitution described as uniform may lead to three final issues. If all the dispositions assumed to be abnormal retain their relative proportion, and are strengthened with maturity, the ultimate result can only be a perverse sexual life. The analysis of such abnormally constituted dispositions has not yet been thoroughly undertaken, but we already know cases that can be readily explained in the light of these theories. Authors believe, for example, that a whole series of fixation perversions must necessarily have had as their basis a congenital weakness of the sexual impulse. The statement seems to me untenable in this form, but it becomes ingenious if it refers to a constitutional weakness of one factor in the sexual impulse, namely, the genital zone, which later in the interests of propagation accepts as a function the sum of the individual sexual activities. In this case the summation which is demanded in puberty must fail and the strongest of the other sexual components continues its activity as a perversion.

Repression. — Another issue results if in the course of development certain powerful components experience a *repression* — which we must carefully note is not a suspension. The excitations in question are produced as usual but are prevented from attaining their aim by psychic

hindrances, and are driven off into many other paths until they express themselves in a symptom. The result can be an almost normal sexual life — usually a limited one — but supplemented by psychoneurotic disease. It is these cases that become so familiar to us through the psychoanalytic investigation of neurotics. The sexual life of such persons begins like that of perverts, a considerable part of their childhood is filled up with perverse sexual activity which occasionally extends far beyond the period of maturity, but owing to inner reasons a repressive change then results — usually before puberty, but now and then even much later — and from this point on without any extinction of the old feelings there appears a neurosis instead of a perversion. One may recall here the saying, “Junge Hure, alte Betschwester,” — only here youth has turned out to be much too short. The relieving of the perversion by the neurosis in the life of the same person, as well as the above mentioned distribution of perversion and hysteria in different persons of the same family, must be placed side by side with the fact that the neurosis is the negative of the perversion.

Sublimation. — The third issue in abnormal constitutional dispositions is made possible by the process of “sublimation,” through which the powerful excitations from individual sources of sexuality are discharged and utilized in other spheres, so that a considerable increase of psychic capacity results from an, in itself dangerous, predisposition. This forms one the sources of artistic activity, and, according as such sublimation is complete or incomplete, the analysis of the character of highly gifted, especially of artistically disposed persons, will show any proportionate, blending between productive ability, perversion, and neurosis. A sub-species of sublimation is the suppression through *reaction-formation*, which, as we have found, begins even in the latency period of infancy, only to continue throughout life in favorable cases. What we call the *character* of a person is built up to a great extent from the material of sexual excitations; it is composed of impulses fixed since infancy and won through sublimation, and of such constructions as are destined to suppress effectually those perverse feelings which are recognized as useless. The general perverse sexual disposition of childhood can therefore be esteemed as a source of a number of our virtues, insofar as it incites their creation through the formation of reactions.

Accidental Experiences. — All other influences lose in significance when compared with the sexual discharges, shifts of repressions, and

sublimations; the inner determinations for the last two processes are totally unknown to us. He who includes repressions and sublimations among constitutional predispositions, and considers them as the living manifestations of the same, has surely the right to maintain that the final structure of the sexual life is above all the result of the congenital constitution. No intelligent person, however, will dispute that in such a coöperation of factors there is also room for the modifying influences of occasional factors derived from experience in childhood and later on.

It is not easy to estimate the effectiveness of the constitutional and of the occasional factors in their relation to each other. Theory is always inclined to overestimate the first while therapeutic practice renders prominent the significance of the latter. By no means should it be forgotten that between the two there exists a relation of coöperation and not of exclusion. The constitutional factor must wait for experiences which bring it to the surface, while the occasional needs the support of the constitutional factor in order to become effective. For the majority of cases one can imagine a so-called “etiological group” in which the declining intensities of one factor become balanced by the rise in the others, but there is no reason to deny the existence of extremes at the ends of the group.

It would be still more in harmony with psychoanalytic investigation if the experiences of early childhood would get a place of preference among the occasional factors. The one etiological group then becomes split up into two which may be designated as the dispositional and the definitive groups. Constitution and occasional infantile experiences are just as coöperative in the first as disposition and later traumatic experiences in the second group. All the factors which injure the sexual development show their effect in that they produce a *regression*, or a return to a former phase of development.

We may now continue with our task of enumerating the factors which have become known to us as influential for the sexual development, whether they be active forces or merely manifestations of the same.

Prematurity. — Such a factor is the spontaneous sexual *prematurity* which can be definitely demonstrated at least in the etiology of the neuroses, though in itself it is as little adequate for causation as the other factors. It manifests itself in a breaking through, shortening, or suspending of the infantile latency period and becomes a cause of disturbances

inasmuch as it provokes sexual manifestations which, either on account of the unready state of the sexual inhibitions or because of the undeveloped state of the genital system, can only carry along the character of perversions. These tendencies to perversion may either remain as such, or after the repression sets in they may become motive powers for neurotic symptoms; at all events, the sexual prematurity renders difficult the desirable later control of the sexual impulse by the higher psychic influences, and enhances the compulsive-like character which even without this prematurity would be claimed by the psychic representatives of the impulse. Sexual prematurity often runs parallel with premature intellectual development; it is found as such in the infantile history of the most distinguished and most productive individuals, and in such connection it does not seem to act as pathogenically as when appearing isolated.

Temporal Factors. — Just like prematurity, other factors, which under the designation of *temporal* can be added to prematurity, also demand consideration. It seems to be phylogenetically established in what sequence the individual impulsive feelings become active, and how long they can manifest themselves before they succumb to the influence of a newly appearing active impulse or to a typical repression. But both in this temporal succession as well as in the duration of the same, variations seem to occur, which must exercise a definite influence on the experience. It cannot be a matter of indifference whether a certain stream appears earlier or later than its counterstream, for the effect of a repression cannot be made retrogressive; a temporal deviation in the composition of the components regularly produces a change in the result. On the other hand impulsive feelings which appear with special intensity often come to a surprisingly rapid end, as in the case of the heterosexual attachment of the later manifest homosexuals. The strivings of childhood which manifest themselves most impetuously do not justify the fear that they will lastingly dominate the character of the grown-up; one has as much right to expect that they will disappear in order to make room for their counterparts. (Harsh masters do not rule long.) To what one may attribute such temporal confusions of the processes of development we are hardly able to suggest. A view is opened here to a deeper phalanx of biological, and perhaps also historical problems, which we have not yet approached within fighting distance.

Adhesion. — The significance of all premature sexual manifestations is enhanced by a psychic factor of unknown origin which at present can be put down only as a psychological preliminary. I believe that it is the *heightened adhesion* or *fixedness* of these impressions of the sexual life which in later neurotics, as well as in perverts, must be added for the completion of the other facts; for the same premature sexual manifestations in other persons cannot impress themselves deeply enough to repeat themselves compulsively and to succeed in prescribing the way for the sexual impulse throughout later life. Perhaps a part of the explanation for this adhesion lies in another psychic factor which we cannot miss in the causation of the neuroses, namely, in the preponderance which in the psychic life falls to the share of memory traces as compared with recent impressions. This factor is apparently dependent on the intellectual development and grows with the growth of personal culture. In contrast to this the savage has been characterized as “the unfortunate child of the moment.” Owing to the oppositional relation existing between culture and the free development of sexuality, the results of which may be traced far into the formation of our life, the problem how the sexual life of the child evolves is of very little importance for the later life in the lower stages of culture and civilization, and of very great importance in the higher.

Fixation. — The influence of the psychic factors just mentioned favored the development of the accidentally experienced impulses of the infantile sexuality. The latter (especially in the form of seductions through other children or through adults) produce the material which, with the help of the former, may become fixed as a permanent disturbance. A considerable number of the deviations from the normal sexual life observed later have been thus established in neurotics and perverts from the beginning through the impressions received during the alleged sexually free period of childhood. The causation is produced by the responsiveness of the constitution, the prematurity, the quality of heightened adhesion, and the accidental excitement of the sexual impulse through outside influence.

The unsatisfactory conclusions which have resulted from this investigation of the disturbances of the sexual life is due to the fact that we as yet know too little concerning the biological processes in which the nature of sexuality consists to form from our isolated examinations a

satisfactory theory for the explanation of either the normal or the pathological.

Note 1: The differences will be emphasized in the schematic representation given in the text. To what extent the infantile sexuality approaches the definitive sexual organization through its object selection has been discussed before ().

Note 2: See my work, Wit and its Relation to the Unconscious, translated by A.A. Brill, Moffat Yard Pub. Co., New York: “The fore-pleasure gained by the technique of wit is utilized for the purpose of setting free a greater pleasure by the removal of inner inhibitions.”

Note 3: Cf. Zur Einführung des Narzismus, Jahrbuch der Psychoanalyse, VI, 1913.

Note 4: It is necessary to make clear that the conceptions “masculine” and “feminine,” whose content seems so unequivocal to the ordinary meaning, belong to the most confused terms in science and can be cut up into at least three paths. One uses masculine and feminine at times in the sense of activity and passivity, again, in the biological sense, and then also in the sociological sense. The first of these three meanings is the essential one and the only one utilizable in psychoanalysis. It agrees with the masculine designation of the libido in the text above, for the libido is always active even when it is directed to a passive aim. The second, the biological significance of masculine and feminine, is the one which permits the clearest determination. Masculine and feminine are here characterized by the presence of semen or ovum and through the functions emanating from them. The activity and its secondary manifestations, like stronger developed muscles, aggression, a greater intensity of libido, are as a rule soldered to the biological masculinity but not necessarily connected with it, for there are species of animals in whom these qualities are attributed to the female. The third, the sociological meaning, receives its content through the observation of the actual existing male and female individuals. The result of this in man is that there is no pure masculinity or feminity either in the biological or psychological sense. On the contrary every individual person shows a mixture of his own biological sex characteristics with the biological traits of the other sex and a union of activity and passivity; this is the case whether these psychological characteristic features depend on the biological or whether they are independent of it.

Note 5: Psychoanalysis teaches that there are two paths of object-finding; the first is the one discussed in the text which is guided by the early infantile prototypes. The second is the narcissistic which seeks its own ego and finds it in the other. The latter is of particularly great significance for the pathological outcomes, but does not fit into the connection treated here.

Note 6: Those to whom this conception appears “wicked” may read Havelock Ellis’s treatise on the relations between mother and child which expresses almost the same ideas (The Sexual Impulse,).

Note 7: For the explanation of the origin of the infantile fear I am indebted to a three-year-old boy whom I once heard calling from a dark room: “Aunt, talk to me, I am afraid because it is dark.” “How will that help you,” answered the aunt; “you cannot see anyhow.” “That’s nothing,” answered the child; “if some one talks then it becomes light.” — He was, as we see, not afraid of the darkness but he was afraid because he missed the person he loved, and he could promise to calm down as soon as he was assured of her presence.

Note 8: Cf. here what was said on page 83 concerning the object selection of the child; the “tender stream.”

Note 9: The incest barrier probably belongs to the historical acquisitions of humanity and like other moral taboos it must be fixed in many individuals through organic heredity. (Cf. my work, Totem and Taboo, 1913.) Psychoanalytic studies show, however, how intensively the individual struggles with the incest temptations during his development and how frequently he puts them into phantasies and even into reality.

Note 10: Compare the description concerning the inevitable relation in the Oedipus legend (The Interpretation of Dreams, , translated by A.A. Brill, The Macmillan Co., New York, and Allen & Unwin, London).

Note 11: Innumerable peculiarities of the human love-life as well as the compulsiveness of being in love itself can surely only be understood through a reference to childhood or as an effective remnant of the same.

Note 12: This was true not only of the “negative” tendencies to perversion appearing in the neurosis, but also of the so-called positive perversions. The latter are not only to be attributed to the fixation of the infantile tendencies, but also to regression to these tendencies owing to the misplacement of other paths of the sexual stream. Hence the positive

perversions are also accessible to psychoanalytic therapy. (Cf. the works of Sadger, Ferenczi, and Brill.)

Note 13: Here one often sees that at first a normal sexual stream begins at the age of puberty, but owing to its inner weakness it breaks down at the first outer hindrance and then changes from regression, to perverse fixation.

Note 14: That keen observer of human nature, E. Zola, describes a girl in his book, La Joie de vivre, who in cheerful self renunciation offers all she has in possession or expectation, her fortune and her life's hopes to those she loves without thought of return. The childhood of this girl was dominated by an insatiable desire for love which whenever she was depreciated caused her to merge into a fit of cruelty.

Note 15: It is possible that the heightened adhesion is only the result of a special intensive somatic sexual manifestation of former years.

JOKES AND THEIR RELATION TO THE UNCONSCIOUS

A. Analysis of Wit

I. Introduction

WHOEVER has had occasion to examine that part of the literature of æsthetics and psychology dealing with the nature and affinities of wit, will, no doubt, concede that our philosophical inquiries have not awarded to wit the important rôle that it plays in our mental life. One can recount only a small number of thinkers who have penetrated at all deeply into the problems of wit. To be sure, among the authors on wit one finds the illustrious names of the poet Jean Paul (Fr. Richter), and of the philosophers Th. Vischer, Kuno Fischer, and Th. Lipps. But even these writers put the subject of wit in the background while their chief interest centers around the more comprehensive and more alluring problems of the comic.

In the main this literature gives the impression that it is altogether impractical to study wit except when treated as a part of the comic.

Presentation of the Subject by Other Authors

According to Th. Lipps (*Komik und Humor,* 1898 [1]) wit is "essentially the subjective side of the comic; i.e., it is that part of the comic which we ourselves create, which colors our conduct as such, and to which our relation is that of Superior Subject, never of Object, certainly not Voluntary Object" (p. 80). The following comment might also be added: — In general we designate as wit "every conscious and clever evocation of the comic, whether the comic element lies in the viewpoint or in the situation itself" (p. 78).

K. Fischer explains the relation between wit and the comic by the aid of caricature, which, according to his exposition, comes midway between the two (*Über den Witz,* 1889). The subject of the comic is the hideous element in any of its manifestations. "Where it is concealed it must be disclosed in the light of the comic view; where it is not at all or but slightly noticeable it must be rendered conspicuous and elucidated in such a manner that it becomes clear and intelligible. Thus arises caricature" (p. 45). "Our entire psychic world, the intellectual realm of our thoughts and conceptions, does not reveal itself to us on superficial consideration. It cannot be visualized directly either figuratively or intuitively, moreover it contains inhibitions, weak points, disfigurements, and an abundance of ludicrous and comical contrasts. In order to bring it out and to make it

accessible to æsthetic examination, a force is necessary which is capable not only of depicting objects directly, but also of reflecting upon these conceptions and elucidating them — namely, a force capable of clarifying thought. This force is nothing but judgment. The judgment which produces the comic contrast is wit. In caricature wit has played its part unnoticed, but only in judgment does it attain its own individual form and the free domain of its evolution."

As can be seen Lipps assigns the determining factor which classifies wit as part of the comic, to the activity or to the active behavior of the subject, whereas K. Fischer characterizes wit by its relation to its object, in which characterization he accentuates the hidden hideous element in the realm of thought. One cannot put to test the cogency of these definitions of wit; one can, in fact, hardly understand them unless one studies the text from which they were taken. One is thus forced to work his way through the author's descriptions of the comic in order to learn anything about wit. From other passages, however, one discovers that the same authors attribute to wit essential characteristics of general validity in which they disregard its relation to the comic.

K. Fischer's characterization of wit which seems to be most satisfactory to this author runs as follows: "Wit is a *playful* judgment" (p. 51). For an elucidation of this expression we are referred to the analogy: "How æsthetic freedom consists in the playful contemplation of objects" (p. 50). In another place (p. 20) the æsthetic attitude towards an object is characterized by the condition that we expect nothing from this object — especially no gratification of our serious needs — but that we content ourselves with the pleasure of contemplating the same. In contrast to labor the æsthetic attitude is *playful*. "It may be that from æsthetic freedom there also results a kind of judgment, freed from the conventional restrictions and rule of conduct, which, in view of its genesis, I will call the *playful* judgment. This conception contains the first condition and possibly the entire formula for the solution of our problem. 'Freedom begets wit and wit begets freedom,' says Jean Paul. Wit is nothing but a free play of ideas" (p. 24).

Since time immemorial a favorite definition of wit has been the ability to discover similarities in dissimilarities, i.e., to find hidden similarities. Jean Paul has jocosely expressed this idea by saying that "wit is the disguised priest who unites every couple." Th. Vischer adds the postscript:

“He likes best to unite those couples whose marriage the relatives refuse to sanction.” Vischer refutes this, however, by remarking that in some witticisms there is no question of comparison or the discovery of similarities. Hence with very little deviation from Jean Paul’s definition he defines wit as the skill to combine with surprising quickness many ideas, which through inner content and connections are foreign to one another. K. Fischer then calls attention to the fact that in a large number of these witty judgments one does not find similarities, but contrasts; and Lipps further remarks that these definitions refer to the wit that the humorist possesses and not to the wit that he produces.

Other viewpoints, in some measure connected with one another, which have been mentioned in defining and describing wit are: “the *contrast of ideas*” “*sense in nonsense*” and “*confusion and clearness.*”

Definitions like those of Kraepelin lay stress upon the contrast of ideas. Wit is “the voluntary combination or linking of two ideas which in some way are contrasted with each other, usually through the medium of speech association.” For a critic like Lipps it would not be difficult to reveal the utter inadequacy of this formula, but he himself does not exclude the element of contrast — he merely assigns it elsewhere. “The contrast remains, but is not formed in a manner to show the ideas connected with the words, rather it shows the contrast or contradiction in the meaning and lack of meaning of the words” (p. 87). Examples show the better understanding of the latter. “A contrast arises first through the fact that we adjudge a meaning to its words which after all we cannot ascribe to them.”

In the further development of this last condition the antithesis of “sense in nonsense” becomes obvious. “What we accept one moment as senseful we later perceive as perfect nonsense. Thereby arises, in this case, the operation of the comic element” (p. 85). “A saying appears witty when we ascribe to it a meaning through psychological necessity and, while so doing, retract it. It may thus have many meanings. We lend a meaning to an expression knowing that logically it does not belong to it. We find in it a truth, however, which later we fail to find because it is foreign to our laws of experience or usual modes of thinking. We endow it with a logical or practical inference which transcends its true content, only to contradict this inference as soon as we finally grasp the nature of the expression itself. The psychological process evoked in us by the witty expression which gives rise to the sense of the comic depends in every case on the

immediate transition from the borrowed feeling of truth and conviction to the impression or consciousness of relative nullity."

As impressive as this exposition sounds one cannot refrain from questioning whether the contrast between the senseful and senseless upon which the comic depends does not also contribute to the definition of wit in so far as it is distinguished from the comic. Also the factor of "confusion and clearness" leads one deeply into the problem of the relation of wit to the comic. Kant, speaking of the comic element in general, states that one of its remarkable attributes is the fact that it can delude us for a moment only. Heymans (*Zeitschr. f. Psychologie,* XI, 1896) explains how the mechanism of wit is produced through the succession of confusion and clearness. He illustrates his meaning by an excellent witticism from Heine, who causes one of his figures, the poor lottery agent, Hirsch-Hyacinth, to boast that the great Baron Rothschild treated him as an equal or quite FAMILLIONAIRE. Here the word which acts as the carrier of the witticism appears in the first place simply as a faulty word-formation, as something incomprehensible, inconceivable, and enigmatic. It is for these reasons that it is confusing. The comic element results from the solution of the enigma and from the understanding of the word. Lipps adds that the first stage of enlightenment, showing that the confusing word means this or that, is followed by a second stage in which one perceives that this nonsensical word has first deluded us and then given us the true meaning. Only this second enlightenment, the realization that it is all due to a word that is meaningless in ordinary usage — this reduction to nothingness produces the comic effect (p. 95).

Whether or not either the one or the other of these two conceptions may seem more clear we are brought nearer to a definite insight through the discussion of the processes of confusion and enlightenment. If the comic effect of Heine's *famillionaire* depends upon the solution of the seemingly senseless word, then the wit would have to be attributed to the formation of this word and to the character of the word so formed.

In addition to the associations of the viewpoints just discussed there is another characteristic of wit which is recognized as peculiar to it by all authors. "Brevity alone is the body and soul of wit," declares Jean Paul (*Vorschule der Aesthetik,* I, 45), and modifies it with a speech of the old tongue-wagger, Polonius, from Shakespeare's *Hamlet* (Act II, Scene 2):

“Therefore, since brevity is the soul of wit,
And tediousness the limbs and outward flourishes,
I will be brief.”

Lipps’s description (p. 90) of the brevity of wit is also significant. He states that wit says what it does say, not always in few, but always in too few words; that is: “It expresses itself in words that will not stand the test of strict logic or of the ordinary mode of thought and expression. In fine it can express itself by leaving the thing unsaid.”

That “wit must unearth something hidden and concealed” — to quote K. Fischer (p. 51) — we have already been taught from the grouping of wit with caricature. I re-emphasize this determinant because it also has more to do with the nature of wit than with its relation to the comic.

I am well aware that the foregoing scanty quotations from the works of the authors on wit cannot do justice to the excellence of these works. In view of the difficulties that confront one in reproducing clearly such complicated and such delicately shaded streams of thought I cannot spare inquiring minds the trouble of searching for the desired information in the original sources. However, I do not know whether they will return fully satisfied. For the criteria and attributes of wit mentioned by these authors, such as — activity, the relation of the content of wit to our thoughts, the character of the playful judgment, the union of dissimilarities, contrasting ideas, “sense in nonsense,” the succession of confusion and clearness, the sudden emergence of the hidden, and the peculiar brevity of wit, seem to us, at first glance, so very pertinent and so easily demonstrable by examples that we cannot succumb to the danger of underestimating the value of such ideas. But they are only disjointed fragments which we should like to see welded into an organic whole. In the end they contribute no more to the knowledge of wit than a number of anecdotes teach us of the true characteristics of a personality whose biography interests us. We do not at all understand the connection that is supposed to exist between the individual conditions; for instance, what the brevity of wit may have to do with that side of wit exhibited in the playful judgment; besides we do not know whether wit must satisfy all or only some of these conditions in order to form real wit; which of them may be replaced and which ones are indispensable. We should also like a grouping and classification of wit in respect to its essential attributes. The classification as given by the authors

is based, on the one hand, on the technical means, and on the other hand, on the utilization of wit in speech (sound-wit, play on words, the wit of caricature, characterization wit, and witty repartee).

Accordingly we should not find ourselves in a dilemma when it comes to pointing out goals for a further effort to explain wit. In order to look forward to success we must either introduce new viewpoints into the work, or try to penetrate further by concentrating our attention or by broadening the scope of our interest. We can prescribe for ourselves the task of at least not permitting any lack along the latter lines. To be sure, it is rather remarkable how few examples of recognized witticisms suffice the authors for their investigations and how each one accepts the ones used by his predecessors. We need not shirk the responsibility of analyzing the same examples which have already served the classical authors, but we contemplate new material besides to lay a broader foundation for our deductions. It is quite natural that we should select such examples of wit as objects for our investigation as have produced the deepest impression upon our own lives and which have caused us the greatest amount of laughter.

Some may inquire whether the subject of wit is worthy of such effort. In my opinion there is no doubt about it, for even if I disregard the personal motives to be revealed during the development of this theme (the motives which drove me to gain an insight into the problem of wit), I can refer to the fact that there is an intimate connection between all psychic occurrences; a connection which promises to furnish a psychological insight into a sphere which, although remote, will nevertheless be of considerable value to the other spheres. One may also be reminded what a peculiar, overwhelmingly fascinating charm wit offers in our society. A new joke operates almost as an event of universal interest. It is passed on from one person to another just like the news of the latest conquest. Even prominent men who consider it worth while relating how they attained fame, what cities and countries they have seen, and with what celebrated persons they have consorted, do not disdain to dwell in their autobiographies upon this and that excellent joke which they have heard. [2]

ENDNOTES.

[1] *Beiträge zur Aesthetik,* edited by Theodor Lipps and Richard Maria Werner, VI, — a book to which I am indebted for the courage and capacity to undertake this attempt.

[2] J. V. Falke: *Lebenserinnerungen*, 1897.

II. The Technique of Wit

WE follow the beckoning of chance and take up as our first example of wit one which has already come to our notice in the previous chapter.

In that part of the *Reisebilder* entitled “Die Bäder von Lucca,” Heine introduces the precious character, Hirsch-Hyacinth, the Hamburg lottery agent and curer of corns, who, boasting to the poet of his relationship with the rich Baron Rothschild, ends thus: “And as true as I pray that the Lord may grant me all good things I sat next to Solomon Rothschild, who treated me just as if I were his equal, quite *famillionaire.”*

It is by means of this excellent and very funny example that Heymans and Lipps have illustrated the origin of the comic effect of wit from the succession of “confusion and clearness.” However, we shall pass over this question and put to ourselves the following inquiry: What is it that causes the speech of Hirsch-Hyacinth to become witty? It can be only one of two things; either it is the thought expressed in the sentence which carries in itself the character of the witticism; or the witticism adheres to the mode of expression which clothes the thought. On whichever side the nature of the wit may lie, there we shall follow it farther and endeavor to elucidate it.

In general a thought may be expressed in different forms of speech — that is, in different words — which may repeat it in its original accuracy. In the speech of Hirsch-Hyacinth we have before us a definite form of thought expressed which seems to us especially peculiar and not very readily comprehensible. Let us attempt to express as exactly as is possible the same thought in other words. Lipps, indeed, has already done this and has thus, to some degree, elucidated the meaning of the poet. He says (p. 87), “We understand that Heine wishes to say that the reception was on a familiar basis, that is, that it was of the friendly sort.” We change nothing in the sense when we assume a different interpretation which perhaps fits better into the speech of Hirsch-Hyacinth: “Rothschild treated me quite as his equal, in a very *familiar* way; that is, as far as this can be done by a *millionaire.”* We would only add, “The condescension of a rich man always carries something embarrassing for the one experiencing it.” [1]

Whether we shall remain content with this or with another equivalent formulation of the thought, we can see that the question which we have put to ourselves is already answered. The character of the wit in this example

does not adhere to the thought. It is a correct and ingenious remark that Heine puts into the mouth of Hirsch-Hyacinth — a remark of indubitable bitterness, as is easily understood in the case of the poor man confronted with so much wealth; but we should not care to call it witty. Now if any one who cannot forget the poet's meaning in the interpretation should insist that the thought in itself is also witty, we can refer him to the definite fact that the witty character is lost in the interpretation. It is true that Hirsch-Hyacinth's speech made us laugh loudly, but though Lipps's or our own accurate rendering may please us and cause us to reflect, yet it cannot make us laugh.

But if the witty character of our example does not belong to the thought, then it must be sought for in the form of expression in the wording. We have only to study the peculiarity of this mode of expression to realize what one may term word- or form-technique. Also we may discover the things that are intimately related to the very nature of wit, since the character as well as the effect of wit disappears when one set of expressions is changed for others. At all events we are in full accord with our authors when we put so much value upon the verbal form of the wit. Thus K. Fischer (p. 72) says: "It is, in the first place, the naked form which is responsible for the perception of wit, and one is reminded of a saying of Jean Paul's which affirms and proves this nature of wit in the same expression. 'Thus the mere position conquers, be it that of warriors or of sentences.'"

Formation of Mixed Words

Now wherein lies the "technique" of this wit? What has occurred to the thought, in our own conception, that it became changed into wit and caused us to laugh heartily? The comparison of our conception with the text of the poet teaches us that two processes took place. In the first place there occurred an important abbreviation. In order to express fully the thought contained in the witticism we had to append to the words "Rothschild treated me just as an equal, on a familiar basis," an additional sentence which in its briefest form reads: i.e., so far as a millionaire can do this. Even then we feel the necessity of an additional explanatory sentence. [2] The poet expresses it in terser terms as follows: "Rothschild treated me just like an equal, quite *famillionaire.*" The entire restriction, which the second sentence imposes on the first thus verifying the familiar

treatment, has been lost in the jest. But it has not been so entirely lost as not to leave a substitute from which it can be reconstructed. A second change has also taken place. The word “familiar” in the witless expression of the thought has been transformed into *“famillionaire”* in the text of the wit, and there is no doubt that the witty character and ludicrous effect of the joke depends directly upon this word-formation. The newly formed word is identical in its first part with the word “familiar” of the first sentence, and its terminal syllables correspond to the word “millionaire” of the second sentence. In this manner it puts us in a position to conjecture the second sentence which was omitted in the text of the wit. It may be described as a composite of two constituents “familiar” and “millionaire,” and one is tempted to depict its origin from the two words graphically.

FAMILIAR
MILLIONAIRE
FAMILLIONAIRE

The process, then, which has carried the thought into the witticism can be represented in the following manner, which, although at first rather fantastic, nevertheless furnishes exactly the actual existing result: “Rothschild treated me quite familiarly, i.e., as well as a millionaire can do that sort of thing.”

Now imagine that a compressing force is acting upon these sentences and assume that for some reason or other the second sentence is of lesser resistance. It is accordingly forced toward the vanishing point, but its important component, the word “millionaire,” which strives against the compressing power, is pushed, as it were, into the first sentence and becomes fused with the very similar element, the word “familiar” of this sentence. It is just this possibility, provided by chance to save the essential part of the second sentence, which favors the disappearance of the other less important components. The jest then takes shape in this manner: “Rothschild treated me in a very famillionaire [(=mili) (=aire)] way.”

Apart from such a compressing force, which is really unknown to us, we may describe the origin of the wit-formation, that is, the technique of the wit in this case, as a *condensation with substitutive formation.* In our example the substitutive formation consists in the formation of a mixed word. This fused word “famillionaire,” incomprehensible in itself but instantly understood in its context and recognized as senseful, is now the

carrier of the mirth-provoking stimulus of the jest, whose mechanism, to be sure, is in no way clearer to us through the discovery of the technique. To what extent can a linguistic process of condensation with substitutive formation produce pleasure through a fused word and force us to laugh? We make note of the fact that this is a different problem, the treatment of which we can postpone until we shall find access to it later. For the present we shall continue to busy ourselves with the technique of wit.

Our expectation that the technique of wit cannot be considered an indifferent factor in the examination of the nature of wit prompts us to inquire next whether there are other examples of wit formed like Heine's "famillionaire." Not many of these exist, but enough to constitute a small group which may be characterized as the blend-word formations or fusions. Heine himself has produced a second witticism from the word "millionaire" by copying himself, as it were, when he speaks of a "millionarr" (*Ideen,* Chap. XIV). This is a visible condensation of "millionaire" and "narr" (fool) and, like the first example, expresses a suppressed by-thought. Other examples of a similar nature are as follows.

During the war between Turkey and the Balkan States, in 1912, *Punch* depicted the part played by Rumania by representing the latter as a highwayman holding up the members of the Balkan alliance. The picture was entitled: *Kleptorumania.* Here the word is a fusion of Kleptomania and Rumania and may be represented as follows:

KLEPTOMANIA
RUMANIA
KLEPTORUMANIA

A naughty jest of Europe has rebaptized a former potentate, Leopold, into *Cleopold* because of his relation to a lady surnamed Cleo. This is a clear form of condensation which by the addition of a single letter forever vividly preserves a scandalous allusion.

In an excellent chapter on this same theme Brill gives the following example. [3]

"De Quincey once remarked that old persons are apt to fall into 'anecdotage.'" The word *Anecdotage,* though in itself incomprehensible, can be readily analyzed to show its original full sense; and on analysis we find that it is made up of two words, *anecdote* and *dotage.* That is, instead of saying that old persons are apt to fall into dotage and that old persons

are fond of telling anecdotes, De Quincey fuses the two words into a neologism, *anecdotage,* and thus simultaneously expresses both ideas. The technique, therefore, lies in the fusion of the two words. Such a fusion of words is called condensation. Condensation is a substitutive formation, i.e., instead of *anecdote* and *dotage* we have *anecdotage.*

"In a short story which I have recently read, one of the characters, a 'sport,' speaks of the Christmas season as the *alcoholidays.* By reduction it can be easily seen that we have here a compound word, a combination of *alcohol* and *holidays* which can be graphically represented as follows:

alcoHOL
HOLidays
ALCOHOLIDAYS

"Here the condensation expresses the idea that holidays are conducive to alcoholic indulgence. In other words, we have here a fused word, which, though strange in appearance, can be easily understood in its proper context. The witticism may be described as a condensation with substitution.

"The same mechanism is found in the following: A dramatic critic, summarizing three paragraphs to the effect that most plays now produced in New York City are violently emotional and hysterical, remarks: 'Thespis has taken up his home in Dramatteawan.' The last word is a condensation of *drama* and *Matteawan.* The substitution not only expressed the critic's idea that most of the plays at present produced in New York are violent, emotional and hysterical, that is insane, but it also contains a clever allusion to the nature of the problem presented by most of these plays. Matteawan is a state hospital for criminal insane. Most of the plays are not only insane, but also criminal since they treat of murders, divorces, robberies, scandals, etc."

When Flaubert published his famous romance *Salammbo,* which treats of life in ancient Carthage, it was scoffingly referred to by Sainte-Beuve as *Carthaginoiserie* on account of its tedious detailed descriptions.

Carthaginoiserie
chinoiserie

During a conversation with a lady I unintentionally furnished the material for a jest. I spoke to her about the great merits of an investigator

whom I considered unjustly ignored. She remarked, “But the man really deserves a monument.” “Perhaps he will get one some day,” I answered, “but at the moment his success is very limited.” “Monument” and “moment” are contrasts. The lady then united these contrasts and said: “Well, let us wish him a *monumentary* success.”

If at this stage the reader should become displeased with a viewpoint which threatens to destroy his pleasure in wit without explaining the source of this pleasure I must beg him to be patient for a while, because we are now confronted with the technique of wit, the examination of which promises many revelations if only we enter into it far enough. Besides the analysis of the examples thus far cited, which show simply a process of condensation, there are others in which the changed expressions manifest themselves in other ways.

Condensation with Modification and Substitution

The following witticisms of Mr. N. will serve as illustrations.

“I was driving with him tête-à-bête.” Nothing is simpler than the reduction of this jest. Evidently it can only mean: I was driving tête-à-tête with Mr. X. and X. is a stupid ass (beast).

Neither of these two sentences is witty nor is there any wit if one combines them into this one: “I was out driving tête-à-tête with that stupid ass (beast).” The wit appears when the words “stupid ass” are omitted and when, as a substitute for them, the first “t” of the second “tête” is changed to “b.” This slight modification brings back to expression the suppressed “bête.” The technique of this group of witticisms may be described as “condensation with a slight modification.” And it would seem that the more insignificant the substitutive modification, the better is the wit.

Quite similar, although not without its complications, is the technique of another form of witticism. During a discussion about a person in whom there was something to praise and much to criticise, N. remarked: “Yes, vanity is one of his four heels of Achilles.” [4] This modification consists in the fact that instead of the one vulnerable heel which was attributed to Achilles we have here four heels. Four heels means four feet and that number is only found on animals. The two thoughts condensed in the witticism are as follows: Except for his vanity he is an admirable fellow; still I do not care for him, for he is more of an animal than a human being. [5]

A similar but simpler joke I heard *statu nascendi* in a family circle. One of two brothers who were attending college was an excellent scholar while the other was only an average student. It so happened that the model boy had a setback in school. The mother discussed this matter and expressed her fear lest this event be the beginning of a lasting deterioration. The boy who until then had been overshadowed by his brother willingly grasped this opportunity to remark: "Yes, Carl is going backward on all-fours."

Here the modification consists in a small addition as an assurance that in his judgment his brother is going backward. This modification represents and takes the place of a passionate plea for his own cause which may be expressed as follows: After all, you must not think that he is so much cleverer than I am simply because he has more success in school. He is really a stupid ass, i.e., much more stupid than I am.

A good illustration of condensation with slight modification is furnished by a well-known witty jest of Mr. N., who remarked about a character in public life that he had a "*great future behind him.*" The butt of this joke was a young man whose ancestry, rearing, and personal qualities seemed to destine him for the leadership of a great party and the attainment of political power at its head. But times changed, the party became politically incompetent, and it could readily be foreseen that the man who was predestined to become its leader would come to nothing. The briefest reduction of the meaning by which one could replace this joke would be: The man has had a great future before him, but that is now past. Instead of "has had" and the appended afterthought there is a small change in the main sentence in which "before" is replaced by its opposite "behind." [6]

Mr. N. made use of almost the same modification in the case of the nobleman who was appointed minister of agriculture for no other reason than that he was interested in agriculture. Public opinion had an opportunity to find out that he was the most incompetent man who had ever been intrusted with this office. When, however, he had relinquished his portfolio and had withdrawn to his agricultural pursuits Mr. N. said of him: "*Like Cincinnatus of Old he has returned to his place in front of the plough.*"

That Roman, who was likewise called to his office from his farm, returned to his place behind the plough. In those days, just as in the

present time, in front of the plough walked — the ox.

We could easily increase these examples by many others, but I am of the opinion that we are in need of no more cases in order to grasp thoroughly the character of the technique of this second group — condensation with modification. If we now compare the second group with the first, the technique of which consisted in condensation with a mixed word-formation, we readily see that the differences are not vital and that the lines of demarcation are indistinct. The mixed word-formation, like the modification, became subordinated to the idea of substitutive formation, and if we desire we can also describe the mixed word-formation as a modification of the parent word through the second elements.

We may make our first pause here and ask ourselves with what known factor in the literature of wit our first result, either in whole or in part, coincides. It obviously agrees with the factor of brevity which Jean Paul calls the soul of wit (*supra*, p. 11). But brevity alone is not wit or every laconism would be witty. The brevity of wit must be of a special kind. We recall that Lipps has attempted to describe more fully the peculiarity of the brevity of wit (*v. s.*, p. 11). Here our investigation started and demonstrated that the brevity of wit is often the result of a special process which has left a second trace — the substitutive formation — in the wording of the wit. By applying the process of reduction, which aims to cause a retrogression in the peculiar process of condensation, we find also that wit depends only upon the verbal expression which was produced by the process of condensation. Naturally our entire interest now centers upon this peculiar and hitherto almost neglected mechanism. Furthermore, we cannot yet comprehend how it can give origin to all that is valuable in wit; namely, the resultant pleasure.

Condensation in Dreams

Have processes similar to those here described as the technique of wit already been noted in another sphere of our psychic life? To be sure, in one apparently remote sphere. In 1900 I published a book which, as indicated by its title (*The Interpretation of Dreams* [7]), makes the attempt to explain the riddle of the dream and to trace the dream to normal psychic operations. I had occasion to contrast there the manifest and often peculiar dream-content with the latent but altogether real thoughts of the dream

from which it originated, and I took up the investigation of the processes which make the dream from the latent dream-thought. I also investigated the psychological forces which participated in this transposition. The sum of the transforming processes I designated as the dream-work and, as a part of this dream-work, I described the process of condensation. This process has a striking similarity to the technique of wit and, like the latter, it leads to abbreviations and brings about substitutive formations of like character.

From recollections of his own dreams the reader will be familiar with the compositions of persons and objects that appear in them; indeed, the dream makes similar compositions of words which can then be reduced by analysis (e.g., Autodidasker — Autodidakt and Lasker [8]). On other occasions and even much more frequently, the condensation work of the dream produces no compositions, but pictures which closely resemble an object or person up to a certain addition or variation which comes from another source, like the modifications in the witticisms of Mr. N. We cannot doubt that in this case, as in the other, we deal with a similar psychic process which is recognizable by identical results. Such a far-reaching analogy between wit-technique and dream-work will surely arouse our interest in the former and stimulate our expectation of finding some explanation of wit from a comparison with the dream. We forbear, however, to enter upon this work by bearing in mind that we have investigated the technique of wit in only a very small number of witty jests, so that we cannot be certain that the analogy, the workings of which we wish to explore, will hold good. Hence we turn away from the comparison with the dream and again take up the technique of wit, leaving, however, at this place of our investigation a visible thread, as it were, which later we shall take up again.

Wit Formed by Word-division

The next point we shall discuss is whether the process of condensation with substitutive formation is demonstrable in all witticisms so that it may be designated as a universal character of the technique of wit. I recall a joke which has clung to my mind through certain peculiar circumstances. One of the great teachers of my youth, whom we considered unable to appreciate a joke — he had never told us a single joke of his own — came into the Institute laughing. With an unwonted readiness he explained the

cause of his good humor. “I have read an excellent joke,” he said. *“A young man who claimed to be a relative of the great J. J. Rousseau, and who bore his name, was introduced into a Parisian drawing-room. It should be added that he was decidedly red-headed. He behaved in such an awkward manner that the hostess ventured this criticism to the gentleman who had introduced him— ‘Vous m’avez fait connaître un jeune homme roux et sot, mais non pas un Rousseau.’”*

At this point our teacher started to laugh again. According to the nomenclature of our authors this is sound-wit and a poor kind at that, since it plays with a proper name.

But what is the technique of this wit? It is quite clear that the character which we had perhaps hoped to demonstrate universally leaves us in the lurch in the first new example. Here there is no omission and scarcely an abbreviation. In the witticism the lady expresses almost everything that we can ascribe to the thoughts. “You have made me look forward to meeting a relative of J. J. Rousseau. I expected that he was perhaps even mentally related to him. Imagine my surprise to find this red-haired foolish boy, a *roux et sot.”* To be sure, I was able to add and insert something, but this attempt at reduction does not annul the wit. It remains fixed and attached to the sound similarity of Rousseau [roux sot]. This proves that condensation with substitution plays no part in the production of this witticism.

With what else do we have to deal? New attempts at reduction taught me that the joke will persistently continue until the name Rousseau is replaced by another. If, e.g., I substitute the name Racine for it I find that although the lady’s criticism is just as feasible as before it immediately loses every trace of wit. Now I know where I can look for the technique of this joke although I still hesitate to formulate it. I shall make the following attempt: The technique of the witticism lies in the fact that one and the same word — the name — is used in a twofold application, once as a whole and once divided into its syllables like a charade.

I can mention a few examples of identical technique. A witticism of this sort was utilized by an Italian lady to avenge a tactless remark made to her by the first Napoleon. Pointing to her compatriots at a court ball he said: *“Tutti gli Italian danzano si male”* (all Italians dance so badly). To which she quickly replied: *“Non tutti, ma buona parte”* (Not all, but a great many) — Buona parte [=Buonaparte]. [9] Brill reports still another

example in which the wit depends on the twofold application of a name: *"Hood once remarked that he had to be a lively Hood for a livelihood."* [10]

At one time when Antigone was produced in Berlin a critic found that the presentation entirely lacked the character of antiquity. The wits of Berlin incorporated this criticism in the following manner: *"Antique? Oh, nay"* (Th. Vischer and K. Fischer).

Manifold Application of the Same Material

In these examples, which will suffice for this species of wit, the technique is the same. A name is made use of twice; first, as a whole, and then divided into its syllables — and in their divided state the syllables yield a different meaning. [11] The manifold application of the same word, once as a whole and then as the component syllables into which it divides itself, was the first case that came to our attention in which technique deviated from that of condensation. Upon brief reflection, however, we must divine from the abundance of examples that come to us that the newly discovered technique can hardly be limited to this single means. Obviously there are any number of hitherto unobserved possibilities for one to utilize the same word or the same material of words in manifold application *in one sentence.* May not all these possibilities furnish technical means for wit? It would seem so, judging by the following examples.

"Two witty statesmen, X and Y, met at a dinner. X, acting as toastmaster, introduced Y as follows: 'My friend, Y, is a very wonderful man. All you have to do is to open his mouth, put in a dinner, and a speech appears, etc.' Responding to the speaker, Y said: 'My friend, the toastmaster, told you what a wonderful man I am, that all you have to do is to open my mouth, put in a dinner, and a speech appears. Now let me tell you what a wonderful man he is. All you have to do is open anybody's mouth, put in his speech, and the dinner appears.'" [12]

In examples of this sort, one can use the same material of words and simply change slightly their order. The slighter the change, the more one gets the impression that different sense was expressed with the same words, the better is the technical means of wit. And how simple are the means of its production! *"Put in a dinner and a speech appears — put in a speech and a dinner appears."* This is really nothing but an exchange of places of these two phrases whereby what was said of Y becomes

differentiated from what is said of X. To be sure, this is not the whole technique of the joke. [13]

Great latitude is afforded the technique of wit if one so extends the *"manifold application of the same material"* that the word — or the words — upon which the wit depends may be used first unchanged and then with a slight modification. An example is another joke of Mr. N. He heard a gentleman, who himself was born a Jew, utter a malicious statement about Jewish character. "Mr. Councilor," said he, "I am familiar with your *antesemitism*, but your *antisemitism* is new to me."

Here only one single letter is changed, the modification of which could hardly be noticed in careless pronunciation. This example reminds one of the other modification jokes of Mr. N., but it differs from them in lacking the condensation. Everything that was to be said has been told in the joke. "I know that you yourself were formerly a Jew, therefore I am surprised that you should rail against the Jew."

An excellent example of such wit modification is also the familiar exclamation: *"Traduttore — Traditore."* [14]

The similarity between the two words, almost approaching identity, results in a very impressive representation of the inevitability by which a translator becomes a transgressor — in the eyes of the author.

The manifoldness of slight modifications possible in these jokes is so great that none is quite similar to the other. Here is a joke which is supposed to have arisen at an examination for the degree of law. The candidate was translating a passage from the Corpus juris, *"Labeo ait."* "'I fall (fail),' says he," volunteered the candidate. "'You fall (fail),' says I," replied the examiner and the examination ended. Whoever mistakes the name of the celebrated Jurist for a word to which he attaches a false meaning certainly deserves nothing better. But the technique of the witticism lies in the fact that the examiner used almost the same words in punishing the applicant which the latter used to prove his ignorance. Besides, the joke is an example of repartee whose technique, as we shall see, is closely allied to the one just mentioned.

Words are plastic and may be moulded into almost any shape. There are some words which have lost their true original meaning in certain usages which they still enjoy in other applications. In one of Lichtenberg's jokes just those conditions have been sought for in which the nuances of the wordings have removed their basic meaning.

"How goes it?" asked the blind of the lame one. "As you see," replied the lame one to the blind.

Language is replete with words which taken in one sense are full of meaning and in another are colorless. There may be two different derivatives from the same root, one of which may develop into a word with a full meaning while the other may become a colorless suffix or prefix, and yet both may have the same sound. The similarity of sound between a word having full meaning and one whose meaning is colorless may also be accidental. In both cases the technique of wit can make use of such relationship of the speech material. The following examples illustrate some of these points.

"Do you call a man kind who remits nothing to his family while away?" asked an actor. *"Call that kindness?" "Yes, unremitting kindness,"* was the reply of Douglas Jerrold. The wit here depends on the first syllable *un* of the word *unremitting. Un* is usually a prefix denoting "not," but by adding it to "remitting" a new relationship is unexpectedly established which changes the meaning of the context. *"An undertaker is one who always carries out what he undertakes."* The striking character upon which the wit here depends is the manifold application of the words *undertaker* and *carry out.* Undertaker commonly denotes one who manages funerals. Only when taken in this sense and using the words *carry out* literally is the sentence witty. The wit lies in the manifold application of the same words.

Double Meaning and Play on Words

If we delve more deeply into the variety of "manifold application" of the same word we suddenly notice that we are confronted with forms of "double meaning" or "plays on words" which have been known a long time and which are universally acknowledged as belonging to the technique of wit. Then why have we bothered our brains about discovering something new when we could just as well have gleaned it from the most superficial treatise on wit? We can say in self-defense only that we are presenting another side of the same phenomena of verbal expressions. What the authors call the "playful" character of wit we treat from the point of view of "manifold application."

Further examples of manifold application which may also be designated under a new and third group, the class of double meaning, may be divided into subdivisions. These, to be sure, are not essentially

differentiated from one another any more than the whole third group from the second. In the first place we have:

(a) Cases of double meaning of a name and its verbal significance: e.g., *"Discharge thyself of our company, Pistol"* (Henry IV, Act II). *"For Suffolk's duke may he suffocate"* (Henry VI, Act I). Heine says, *"Here in Hamburg rules not the rascally Macbeth, but Banko* (Banquo)."

In those cases where the unchanged name cannot be used, — one might say "misused," — one can get a double meaning by means of familiar slight modifications: *"Why have the French rejected Lohengrin?"* was a question asked some time ago. The answer was, *"On Elsa's* (Alsace) *account."*

(b) Cases where a double meaning is obtained by using a word which has both a verbal and metaphoric sense furnish an abundant source for the technique of wit. A medical colleague, who was well known for his wit, once said to Arthur Schnitzler, the writer: *"I am not at all surprised that you became a great poet. Your father had already held up the mirror to his contemporaries."* The mirror used by the father of the writer, the famous Dr. Schnitzler, was the laryngoscope. According to the well-known quotation from *Hamlet* (Act III, Scene 2), the object of the play as well as the writer who creates it is to "hold, as 't were, the mirror up to nature; to show virtue her own feature, scorn her own image, and the very age and body of the time his form and pressure."

(c) Cases of actual double meaning or play on words — the ideal case, as it were, of manifold application. Here no violence is done to the word. It is not torn into syllables. It need not undergo any modifications. It need not exchange its own particular sphere, say as a proper name, for another. Thanks to certain circumstances it can express two meanings just as it stands in the structure of the sentence. Many examples are at our disposal.

One of the first royal acts of the last Napoleon was, as is well known, the confiscation of the estates belonging to the House of Orleans. *"C'est le premier vol de l'aigle"* was an excellent play on words current at that time. "Vol" means both flight and theft. Louis XV wished to test the wit of one of his courtiers whose talent in that direction he had heard about. He seized his first opportunity to command the cavalier to concoct a joke at his (the king's) expense. He wanted to be the "subject" of the witticism. The courtier answered him with the clever *bonmot, "Le roi n'est pas sujet."* "Subject" also means "vassal." (Taken from K. Fischer.)

A physician, leaving the sick-bed of a wife, whose husband accompanied him, exclaimed doubtfully: "I do not like her looks." "I have not liked her looks for a long time," was the quick rejoinder of the husband. The physician, of course, referred to the condition of the wife, but he expressed his apprehension about the patient in such words as to afford the husband the means of utilizing them to assert his conjugal aversion. Concerning a satirical comedy Heine remarked: *"This satire would not have been so biting had the author of it had more to bite."* This jest is a better example of metaphoric and common double meaning than of real play upon words, but at present we are not concerned about such strict lines of demarcation. *Charles Matthews, the elder, one of England's greatest actors, was asked what he was going to do with his son* (the young man was destined for architecture). *"Why"* answered the comedian, *"he is going to draw houses like his father." Foote once asked a man why he forever sang one tune. "Because it haunts me," replied the man. "No wonder," said Foote, "you are continually murdering it."* Said the Dyspeptic Philosopher: *"One swallow doesn't make a summer, nor quench the thirst."*

A gentleman had shown much ingenuity in evading a notorious borrower whom he had sent away many times with the request to call when he was "in." One day, however, the borrower eluded the servant at the door and cornered his victim.

"Ah," said the host, seeing there was no way out of it, "at last I am in."

"No," returned the borrower in anticipation, "at last I am in and you are out."

Heine said in the *Harzreise: "I cannot recall at the moment the names of all the students, and among the professors there are some who have no name as yet."*

Dr. Johnson said of the University of St. Andrews in Scotland, which was poor in purse, but prolific in the distribution of its degrees: *"Let it persevere in its present plan and it may become rich* by degrees." Here the wit depends more on the manifold application than on the play on words.

The keen-witted writer, Horatio Winslow, sums up the only too-familiar history of some American families as follows:

A TALE OF TWO AMERICAN GENERATIONS

Gold Mine

Gold Spoon

Gold Cure

The last couplet, gold cure, refers to the familiar cure for alcoholism. This wit is an excellent example of unification — everything is, as it were, of gold. The manifold meanings of the adjective which do not very strikingly contrast with one another make possible this "manifold application."

Ambiguity

Another play on words will facilitate the transition to a new subdivision of the technique of double meaning. The witty colleague who was responsible for the joke mentioned above is likewise responsible for this joke, current during the trial of Dreyfus:

"This girl reminds me of Dreyfus. The army does not believe in her innocence."

The word innocence, whose double meaning furnishes the basis of the witticism, has in one connection the customary meaning which is the opposite of guilt or transgression, while in the other connection it has a sexual sense, the opposite of which is sexual experience. There are very many such examples of double meaning and in each one the point of the joke refers especially to a sexual sense. The group could be designated as "ambiguous." *A good example to illustrate this is the story told of a wealthy but elderly gentleman who showed his devotion to a young actress by many lavish gifts. Being a respectable girl she took the first opportunity to discourage his attentions by telling him that her heart was already given to another man. "I never aspired as high as that," was his polite answer.*

If one compares this example of double-meaning-with-ambiguity with other examples one cannot help noticing a difference which is not altogether inconsequential to the technique. In the joke about "innocence" one meaning of the word is just as good for our understanding of it as the other. One can really not decide whether the sexual or non-sexual significance of the word is more applicable and more familiar. But it is different with the other example mentioned. Here the final sense of the words, "I never aspired as high as that," is by far more obtrusive and covers and conceals, as it were, the sexual sense which could easily escape the unsuspecting person. In sharp contrast to this let us examine another

example of double meaning in which there is no attempt made to veil its sexual significance — e.g., Heine's characterization of a complaisant lady: *"She could pass* (*abschlagen*) *nothing except her water."* It sounds like an obscene joke and the wit in it is scarcely noticed. [15] But the peculiarity that both senses of the double meaning are not equally manifested can occur also in witticisms without sexual reference providing that one sense is more common or that it is preferred on account of its connection with the other parts of the sentence (e.g., *c'est le premier vol de l'aigle*). All these examples I propose to call double meaning with allusion.

We have by this time become familiar with such a large number of different techniques of wit that I am afraid we may lose sight of them. Let us, therefore, attempt to make a summary.

I. CONDENSATION
(a) with mixed word-formation.
(b) with modification.
II. THE APPLICATION OF THE SAME MATERIAL
(c) The whole and the part.
(d) Change of order.
(e) Slight modification.
(f) The same words used in their full or colorless sense.
III. DOUBLE MEANING
(g) Name and verbal significance.
(h) Metaphorical and verbal meaning.
(i) True double meaning (play on words).
(j) Ambiguous meaning.
(k) Double meaning with allusion.

This variety causes confusion. It might vex us because we have devoted so much time to the consideration of the technical means of wit, and the stress laid on the forms might possibly arouse our suspicions that we are overvaluing their importance so far as the knowledge of the nature of wit is concerned. But this conjecture is met by the one irrefutable fact: namely, that each time the wit disappears as soon as we remove the effect that was brought to expression by these techniques. We are thus directed to search for the unity in this variety. It must be possible to bring all these techniques under one head. As we have remarked before, it is not difficult to unite the second and third groups, for the double meaning, the play on

words, is nothing but the ideal case of utilizing the same material. The latter is here apparently the more comprehensive conception. The examples of dividing, changing the order of the same material, manifold application with slight modifications (c, d, e) — all these could, without difficulty, be subordinated under the conception of double meaning. But what community exists between the technique of the first group — condensation with substitutive formation — and the two other groups — manifold application of the same material?

The Tendency to Economy

It seems to me that this agreement is very simple and clear. The application of the same material is only a special case of condensation and the play on words is nothing but a condensation without substitutive formation. Condensation thus remains as the chief category. A compressing or — to be more exact — an economic tendency controls all these techniques. As Prince Hamlet says: "Thrift, Horatio, thrift." It seems to be all a matter of economy.

Let us examine this economy in individual cases. *"C'est le premier vol de l'aigle."* That is, the first flight of the eagle. Certainly, but it is a depredatious flight. Luckily for the gist of this joke "vol" signifies flight as well as depredation. Has nothing been condensed and economized by this? Certainly, the entire second thought, and it was dropped without any substitution. The double sense of the word "vol" makes such substitution superfluous, or what is just as correct: The word "vol" contains the substitution for the repressed thought without the necessity of supplementing or varying the first sentence. Therein consists the benefit of the double meaning.

Another example: *Gold mine, — gold spoon*, the enormous economy of expression the single word "gold" produces. It really tells the history of two generations in the life of some American families. The father made his fortune through hard toiling in the gold fields during the early pioneer days. The son was born with a golden spoon in his mouth; having been brought up as the son of a wealthy man, he becomes a chronic alcoholic and has to take the gold cure.

Thus there is no doubt that the condensation in these examples produces economy and we shall demonstrate that the same is true in all cases. Where is the economy in such jokes as *"Rousseau — roux et sot,"*

or *"Antigone — antique-oh-nay"* in which we first failed to find the prime factors in causing us to establish the technique of the manifold application of the same material? In these cases condensation will naturally not cover the ground, but when we exchange it for the broader conception of "economy" we find no difficulty. What we save in such examples as those just given is quite obvious. We save ourselves the trouble of making a criticism, of forming a judgment. Both are contained in the names. The same is true in the *"livelihood"* example and the others, thus far analyzed. Where one does not save much is in the example of *"I am in and you are out,"* at least the wording of a new answer is saved. The wording of the address, *"I am in,"* serves also for the answer. It is little, but in this little lies the wit. The manifold application of the same words in addressing and answering surely comes under the heading of economy. Note how Hamlet sums up the quick succession of the death of his father and the marriage of his mother:

"the funeral baked meats
Did coldly furnish forth the marriage tables."

But before we accept the "tendency to economize" as the universal character of wit and ask whence it originates, what it signifies, and how it gives origin to the resultant pleasure, we shall concede a doubt which may justly be considered. It may be true that every technique of wit shows the tendency to economize in expression, but the relationship is not reversible. Not every economy in expression or every brevity is witty on that account. We once raised this question when we still hoped to demonstrate the condensation process in every witticism and at that we justly objected by remarking that a laconism is not necessarily wit. Hence it must be a peculiar form of brevity and economy upon which the character of the wit depends, and just as long as we are ignorant of this peculiarity the discovery of the common element in the technique of wit will bring us no nearer a solution. Besides, we have the courage to acknowledge that the economies caused by the technique of wit do not impress us as very much. They remind one of the manner in which many a housewife economizes when she spends time and money to reach a distant market because the vegetables can there be had a cent cheaper. What does wit save by means of its technique? Instead of putting together a few new words, which, for the most part, could have been accomplished without any effort, it goes to

the trouble of searching for the word which comprises both ideas. Indeed, it must often at first transform the expression of one of the ideas into an unusual form until it furnishes an associative connection with the second thought. Would it not have been simpler, easier, and really more economical to express both thoughts as they happen to come even if no agreement in expression results? Is not the economy in verbal expression more than abrogated through the expenditure of intellectual work? And who economized through it, whom does it benefit? We can temporarily circumvent these doubts by leaving them unsolved until later on. Are we really familiar enough with all the forms of techniques of wit? It will surely be safer to gather new examples and submit them to analysis.

Puns

Indeed, we have not yet given consideration to one of the largest groups into which the techniques of wit may be divided. In this we have perhaps been influenced by the low estimate in which this form of wit is held. It embraces those jokes which are commonly called "puns." These are generally counted as the lowest form of wit, perhaps because they are "cheapest" and can be formed with the least effort. They really make the least demands on the technique of expression just as the actual play on words makes the most. Whereas in the latter both meanings find expression in the identical word, and hence usually in a word used only once, in the pun it is enough if two words for both meanings resemble each other through some slight similarity in structure, in rhythmic consonance, in the community of several vowels, or in some other similar manner. The following examples illustrate these points:

"We are now fallen into that critical age wherein *censores* liberorum are become *censores librorum: Lectores, Lictores."*

Professor Cromwell says that Rome in exchanging her religion changed *Jupiter* to *Jew Peter.*

It is related that some students wishing to play a trick on Agassiz, the great naturalist, constructed an insect made up of parts taken from different bugs and sent it to him with the question, "What kind of a bug is this?" His answer was "Humbug."

Puns are especially fond of modifying one of the vowels of the word; e.g., Hevesi (*Almanaccando, Reisen in Italien,* p. 87) says of an Italian poet who was hostile to the German emperor, but who was, nevertheless,

forced to sing his praises in his hexameters, *"Since he could not exterminate the Cæsars he at least annihilated the cæsuras."*

From the multitude of puns which are at our disposal it may be of special interest to us to quote a really poor example for which Heine (*Book Le Grand,* Chapter V) is responsible. *After parading for a long time before his lady as an "Indian Prince" the suitor suddenly lays aside his mask and confesses, "Madam, I have lied to you. I have never been in Calcutta any more than that Calcutta roast which I relished yesterday for lunch."* Obviously the fault of this witticism lies in the fact that both words are not merely similar, but identical. The bird which served as a roast for his lunch is called so because it comes from, or at least is supposed to come from, the same city of Calcutta.

K. Fischer has given much attention to this form of wit and insists upon making a sharp distinction between it and the "play on words" (p. 78). "A pun," he says, "is a bad play on words, for it does not play with the word as a word, but merely as a sound." The play on words, however, "transfers itself from the sound of the word into the word itself." On the other hand, he also classifies such jokes as "famillionaire, Antigone (Antique-Oh-nay)," etc., with sound-wit. I see no necessity to follow him in this. In the plays on words, also, the word serves us only as a sound to which this or that meaning attaches itself. Here also usage of language makes no distinction, and when it treats "puns" with disdain but the play on words with a certain respect it seems that these estimations are determined by others as technical viewpoints. One should bear in mind the forms of wit which are referred to as puns. There are persons who have the ability, when they are in a high-spirited mood, to reply with a pun for a long time to every sentence addressed to them. Brill [16] relates that at a gathering some one spoke disparagingly of a certain drama and wound up by saying, *"It was so poor that the first act had to be rewritten." "And now it is rerotten," added the punster of the gathering.*

At all events we can already infer from the controversies about the line of demarcation between puns and play on words that the former cannot aid us in finding an entirely new technique of wit. Even if no claims are made for the pun that it utilizes the manifold application of the same material, the accent, nevertheless, falls upon the rediscovering of the familiar and upon the agreement between both words forming the pun. Thus the latter is

only a subspecies of the group which reaches its height in the real play on words.

Displacements

There are some witticisms, however, whose techniques baffle almost every attempt to classify them under any of the groups so far investigated. *It is related that while Heine and the poet Soulié were once chatting together in a Parisian drawing-room, there entered one of those Parisians whom one usually compared to Midas, but not alone on account of their money. He was soon surrounded by a crowd which treated him with the greatest deference. "Look over there," said Soulié to Heine, "and see how the nineteenth century is worshipping the Golden Calf." Heine cast one glance upon the object of adoration and replied, as if correcting his friend: "Oh, he must be older than that"* (K. Fischer, p. 82).

Wherein lies the technique of this excellent witticism? According to K. Fischer it lies in the play on words. Thus, for example, he says, "the words 'Golden Calf' may signify Mammon as well as idol-worship, — in the first case the gold is paramount; in the second case it is the animal picture. It may likewise serve to designate in a rather uncomplimentary way one who has very much money and very little brains." If we apply the test and take away the expression "Golden Calf" we naturally also abrogate the wit. We then cause Soulié to say, "Just see how the people are thronging about that blockhead only because he is rich." To be sure, this is no longer witty. Nor would Heine's answer be possible under these circumstances. But let us remember that it is not at all a matter of Soulié's witty comparison, but of Heine's retort, which is surely much more witty. We have then no right to disturb the phrase "the golden calf" which remains as a basis for Heine's words and the reduction can only be applied to the latter. If we dilate upon the words, "Oh, he must be older than that," we can only proceed as follows:

"Oh, he is no longer a calf; he is already a full-grown ox." Heine's wit is therefore based on the fact that he no longer took the "golden calf" metaphorically, but personally by referring it to the moneyed individual himself. If this double meaning is not already contained in the opinion of Soulié!

Let us see. We believe that we can state that this reduction has not altogether destroyed Heine's joke, but, on the contrary, it has left its

essential element untouched. It reads as if Soulié were now saying, “Just see how the nineteenth century is worshipping the golden calf,” and as if Heine were retorting, “Oh, he is no longer a calf. He is already an ox.” And even in this reduced form it is still a witticism. However, another reduction of Heine’s words is not possible.

It is a pity that this excellent example contains such complicated technical conditions. And as it cannot aid us toward enlightenment we shall leave it to search for another in which we imagine we can perceive a relationship with the former one.

It is a “bath” joke treating of the dread which some Jews are said to have for bathing. We demand no patent of nobility for our examples nor do we make inquiries about their origin. The only qualifications we require are that they should make us laugh and serve our theoretical interest. It is to be remarked that both these demands are satisfied best by Jewish jokes.

Two Jews meet near a bathing establishment. “Have you taken a bath?” asked one. “How is that?” replies the other. “Is one missing?”

When one laughs very heartily about a joke he is not in the best mood to investigate its technique. It is for this reason that some difficulties are experienced in delving into their analyses. “That is a comic misunderstanding” is the thought that comes to us. Yes, but how about the technique of this joke? Obviously the technique lies in the double meaning of the word *take.* In the first case the word is used in a colorless idiomatic sense, while in the second it is the verb in its full meaning. It is, therefore, a case where the same word is taken now in the “full” and now in the “empty” sense (Group II, f). And if we replace the expression “take a bath” by the simpler equivalent “bathed” the wit disappears. The answer is no longer fitting. The joke, therefore, lies in the expression “take a bath.”

This is quite correct, yet it seems that in this case, also, the reduction was applied in the wrong place, for the joke does not lie in the question, but in the answer, or rather in the counter question: “How is that? Is there one missing?” Provided the same is not destroyed the answer cannot be robbed of its wit by any dilation or variation. We also get the impression that in the answer of the second Jew the overlooking of the bath is more significant than the misconception of the word “take.” However, here, too, things do not look quite clear and we will, therefore, look for a third example.

Once more we shall resort to a Jewish joke in which, however, the Jewish element is incidental only. Its essence is universally human. It is true that this example, too, contains undesirable complications, but luckily they are not of the kind so far which have kept us from seeing clearly.

In his distress a needy man borrowed twenty-five dollars from a wealthy acquaintance. The same day he was discovered by his creditor in a restaurant eating a dish of salmon with mayonnaise. The creditor reproached him in these words: "You borrow money from me and then order salmon with mayonnaise. Is that what you needed the money for?" "I don't understand you," responded the debtor, "when I have no money I can't eat salmon with mayonnaise. When I have money I mustn't eat it. Well then, when shall I ever eat salmon with mayonnaise?"

Here we no longer discover any double meaning. Even the repetition of the words "salmon with mayonnaise" cannot contain the technique of the witticism, as it is not the "manifold application of the same material," but an actual, identical repetition required by the context. We may be temporarily nonplussed in this analysis, and, as a pretext, we may wish to dispute the character of the wit in the anecdote which causes us to laugh. What else worthy of notice can be said about the answer of the poor man? It may be supposed that the striking thing about it is its logical character, but, as a matter of fact, the answer is illogical. The debtor endeavors to justify himself for spending the borrowed money on luxuries and asks, with some semblance of right, when he is to be allowed to eat salmon. But this is not at all the correct answer. The creditor does not blame him for eating salmon on the day that he borrowed the money, but reminds him that in his condition he has no right to think of such luxuries at all. The poor *bon vivant* disregards this only possible meaning of the reproach, centers his answer about another point, and acts as if he did not understand the reproach.

Is it possible that the technique of this joke lies in this deviation of the answer from the sense of reproach? A similar changing of the viewpoint — displacement of the psychic accent — may perhaps also be demonstrated in the two previous examples which we felt were related to this one. This can be successfully shown and solves the technique of these examples. Soulié calls Heine's attention to the fact that society worships the "golden calf" in the nineteenth century just as the Jewish nation once did in the desert. To this an answer from Heine like the following would

seem fit: “Yes, that is human nature. Centuries have changed nothing in it;” or he might have remarked something equally apposite. But Heine deviates in his manner from the instigated thought. Indeed, he does not answer at all. He makes use of the double meaning found in the phrase “golden calf” to go off at a tangent. He seizes upon one of the components of the phrase, namely, “the calf,” and answers as if Soulié’s speech placed the emphasis on it— “Oh, he is no longer a calf, etc.” [17]

The deviation is much more evident in the bath joke. This example requires a graphic representation. The first Jew asks, “Have you taken a *bath?*” The emphasis lies upon the bath element. The second answers as if the query were: “Have you *taken* a bath?” The displacement would have been impossible if the question had been: “Have you bathed?” The witless answer would have been: “Bathed? What do you mean? I don’t know what that means.” However, the technique of the wit lies in the displacement of the emphasis from “to bathe” to “to take.” [18]

Let us return to the example “salmon with mayonnaise,” which is the purest of its kind. What is new in it will direct us into various paths. In the first place we have to give the mechanism of this newly discovered technique. I propose to designate it as having *displacement* for its most essential element. The deviation of the trend of thought consists in displacing the psychic accent to another than the original theme. It is then incumbent upon us to find out the relationship of the technique of displacement to the expression of the witticism. Our example (salmon with mayonnaise) shows us that the displacement technique is absolutely independent of the verbal expression. It does not depend upon words, but upon the mental trend, and to abrogate it we are not helped by substitution so long as the sense of the answer is adhered to. The reduction is possible only when we change the mental trend and permit the gastronomist to answer directly to the reproach which he eluded in the conception of the joke. The reduced conception will then be: “What I like I cannot deny myself, and it is all the same to me where I get the money for it. Here you have my explanation as to why I happen to be eating salmon with mayonnaise today just after you have loaned me some money.” But that would not be a witticism but a *cynicism.* It will be instructive to compare this joke with one which is closely allied to it in meaning.

A man who was addicted to drink supported himself in a small city by giving lessons. His vice gradually became known and he lost most of his

pupils in consequence. A friend of his took it upon himself to admonish him to reform. "Look here," he said, "you could have the best scholars in town if you would give up drinking. Why not do it?" "What are you talking about?" was the indignant reply. "I am giving lessons in order to be able to drink. Shall I give up drinking in order to obtain scholars?"

This joke, too, carries the stamp of logic which we have noted in the case of "salmon with mayonnaise," but it is no longer displacement-wit. The answer is a direct one. The cynicism, which is veiled there, is openly admitted here, "For me drink is the most important thing." The technique of this witticism is really very poor and cannot explain its effect. It lies merely in the change in order of the same material, or to be more exact, in the reversal of the means-and-end relationship between drink and giving lessons or getting scholars. As I gave no greater emphasis in the reduction to this factor of the expression the witticism is somewhat blurred; it may be expressed as follows: "What a senseless demand to make. For me, drink is the most important thing and not the scholars. Giving lessons is only a means towards more drink." The wit is really dependent upon the expression.

In the bath wit, the dependence of the witticism upon the wording "have you taken a bath" is unmistakable and a change in the wording nullifies the joke. The technique in this case is quite complicated. It is a combination of double meaning (sub-group f) and displacement. The wording of the question admits a double meaning. The joke arises from the fact that the answer is given not in the sense expected by the questioner, but has a different subordinate sense. By making the displacement retrogressive we are accordingly in position to find a reduction which leaves the double meaning in the expression and still does away with the wit.

"Have you taken a bath?" "Taken what? A bath? What is that?" But that is no longer a witticism. It is simply either a spiteful or playful exaggeration.

In Heine's joke about the "golden calf" the double meaning plays a quite similar part. It makes it possible for the answer to deviate from the instigated stream of thought — a thing which happens in the joke about "salmon and mayonnaise" — without any such dependence upon the wording. In the reduction Soulié's speech and Heine's answer would be as follows: "It reminds one very much of the worship of the golden calf when

one sees the people throng around that man simply because he is rich." Heine's answer would be: "That he is made so much of on account of his wealth is not the worst part. You do not emphasize enough the fact that his ignorance is forgiven on account of his wealth." Thus, while the double meaning would be retained the displacement-wit would be eliminated.

Here we may be prepared for the objection which might be raised, namely, that we are seeking to tear asunder these delicate differentiations which really belong together. Does not every double meaning furnish occasion for displacement and for a deviation of the stream of thought from one sense to another? And shall we agree that a "double meaning" and "displacement" should be designated as representatives of two entirely different types of wit? It is true that a relation between double meaning and displacement actually exists, but it has nothing to do with our differentiation of the techniques of wit. In cases of double meaning the wit contains nothing but a word capable of several interpretations which allows the hearer to find the transition from one thought to another, and which with a little forcing may be compared to a displacement. In the cases of displacement-wit, however, the witticism itself contains a stream of thought in which the displacement is brought about. Here the displacement belongs to the work which is necessary for its understanding. Should this differentiation not be clear to us we can make use of the reduction method, which is an unfailing way for tangible demonstration. We do not deny, however, that there is something in this objection. It calls our attention to the fact that we cannot confuse the psychic processes in the formation of wit (the wit-work) with the psychic processes in the conception of the wit (the understanding-work). The object of our present investigation will be confined only to the former. [19]

Are there still other examples of the technique of displacement? They are not easily found, but the following witticism is a very good specimen. It also shows a lack of overemphasized logic found in our former examples.

A horse-dealer in recommending a saddle horse to his client said: "If you mount this horse at four o'clock in the morning you will be in Monticello at six-thirty in the morning." "What will I do in Monticello at six-thirty in the morning?" asked the client.

Here the displacement is very striking. The horse-dealer mentions the early arrival in the small city only with the obvious intention of proving

the efficiency of the horse. The client disregards the capacity of the animal, about which he evidently has no more doubts, and takes up only the data of the example selected for the test. The reduction of this joke is comparatively simple.

More difficulties are encountered by another example, the technique of which is very obscure. It can be solved, however, through the application of double meaning with displacement. The joke relates the subterfuge employed by a “schadchen” (Jewish marriage broker). It belongs to a class which will claim more of our attention later.

The “schadchen” had assured the suitor that the father of the girl was no longer living. After the engagement had been announced the news leaked out that the father was still living and serving a sentence in prison. The suitor reproached the agent for deceiving him. “Well,” said the latter, “what did I tell you? Do you call that living?”

The double meaning lies in the word “living,” and the displacement consists in the fact that the “schadchen” avoids the common meaning of the word, which is a contrast to “death,” and uses it in the colloquial sense: “You don’t call that living.” In doing this he explains his former utterance as a double meaning, although this manifold application is here quite out of place. Thus far the technique resembles that of the “golden calf” and the “bath” jokes. Here, however, another factor comes into consideration which disturbs the understanding of the technique through its obtrusiveness. One might say that this joke is a “characterization-wit.” It endeavors to illustrate by example the marriage agent’s characteristic admixture of mendacious impudence and repartee. We shall learn that this is only the “show-side” of the façade of the witticism, that is, its sense. Its object serves a different purpose. We shall also defer our attempt at reduction. [20]

After these complicated examples, which are not at all easy to analyze, it will be gratifying to find a perfectly pure and transparent example of “displacement-wit.” *A beggar implored the help of a wealthy baron for a trip to Ostend, where he asserted the physicians had ordered him to take sea baths for his health. “Very well, I shall assist you,” said the rich baron, “but is it absolutely necessary for you to go to Ostend, which is the most expensive of all watering-places?” “Sir,” was the reproving reply, “nothing is too expensive for my health.”* Certainly that is a proper attitude, but hardly proper for the supplicant. The answer is given from the

viewpoint of a rich man. The beggar acts as if it were his own money that he was willing to sacrifice for his health, as if money and health concerned the *same* person.

Nonsense as a Technical Means

Let us take up again in this connection the instructive example of "salmon with mayonnaise." It also presents to us a side in which we noticed a striking display of logical work and we have learned from analyzing it that this logic concealed an error of thought, namely, a displacement of the stream of thought. Henceforth, even if only by way of contrast association, we shall be reminded of other jokes which, on the contrary, present clearly something contradictory, something nonsensical, or foolish. We shall be curious to discover wherein the technique of the witticism lies. I shall first present the strongest and at the same time the purest example of the entire group. Once more it is a Jewish joke.

Ike was serving in the artillery corps. He was seemingly an intelligent lad, but he was unwieldy and had no interest in the service. One of his superiors, who was kindly disposed toward him, drew him aside and said to him: "Ike, you are out of place among us. I would advise you to buy a cannon and make yourself independent."

The advice, which makes us laugh heartily, is obvious nonsense. There are no cannon to be bought and an individual cannot possibly make himself independent as a fighting force or establish himself, as it were. One cannot remain one minute in doubt but that this advice is not pure nonsense, but witty nonsense and an excellent joke. By what means does the nonsense become a witticism?

We need not meditate very long. From the discussions of the authors in the Introduction we can guess that sense lurks in such witty nonsense, and that this sense in nonsense transforms nonsense into wit. In our example the sense is easily found. The officer who gives the artilleryman, Ike, the nonsensical advice pretends to be stupid in order to show Ike how stupidly he is acting. He imitates Ike as if to say, "I will now give you some advice which is exactly as stupid as you are." He enters into Ike's stupidity and makes him conscious of it by making it the basis of a proposition which must meet with Ike's wishes, for if Ike owned a cannon and took up the art of warfare on his own account, of what advantage would his intelligence and ambition be to him? How would he take care of the cannon and

acquaint himself with its mechanism in order to meet the competition of other possessors of cannon?

I am breaking off the analysis of this example to show the same sense in nonsense in a shorter and simpler, though less glaring case of nonsense-wit.

"Never to be born would be best for mortal man." "But," added the sages of the *Fliegende Blätter, "hardly one man in a hundred thousand has this luck."*

The modern appendix to the ancient philosophical saying is pure nonsense, and becomes still more stupid through the addition of the seemingly careful "hardly." But this appendix in attaching itself to the first sentence incontestably and correctly limits it. It can thus open our eyes to the fact that that piece of wisdom so reverently scanned, is neither more nor less than sheer nonsense. He who is not born of woman is not mortal; for him there exists no "good" and no "best." The nonsense of the joke, therefore, serves here to expose and present another bit of nonsense as in the case of the artilleryman. Here I can add a third example which, owing to its context, scarcely deserves a detailed description. It serves, however, to illustrate the use of nonsense in wit in order to represent another element of nonsense.

A man about to go upon a journey intrusted his daughter to his friend, begging him to watch over her chastity during his absence. When he returned some months later he found that she was pregnant. Naturally he reproached his friend. The latter alleged that he could not explain this unfortunate occurrence. "Where has she been sleeping?" the father finally asked. "In the same room with my son," replied the friend. "How is it that you allowed her to sleep in the same room with your son after I had begged you so earnestly to take good care of her?" remonstrated the father. "Well," explained the friend, "there was a screen between them. There was your daughter's bed and over there was my son's bed and between them stood the screen." "And suppose he went behind the screen? What then?" asked the parent. "Well, in that case," rejoined the friend thoughtfully, "it might be possible."

In this joke — aside from the other qualities of this poor witticism — we can easily get the reduction. Obviously, it would read like this: "You have no right to reproach me. How could you be so foolish as to leave your daughter in a house where she must live in the constant companionship of

a young man? As if it were possible for a stranger to be responsible for the chastity of a maiden under such circumstances!" The seeming stupidity of the friend here also serves as a reflection of the stupidity of the father. By means of the reduction we have eliminated the nonsense contained in the witticism as well as the witticism itself. We have not gotten rid of the "nonsense" element itself, as it finds another place in the context of the sentence after it has been reduced to its true meaning.

We can now also attempt the reduction of the joke about the cannon. The officer might have said: "I know, Ike, that you are an intelligent business man, but I must tell you that you are very stupid if you do not realize that one cannot act in the army as one does in business, where each one is out for himself and competes with the other. Military service demands subordination and co-operation."

The technique of the nonsense witticisms hitherto discussed really consists in advancing something apparently absurd or nonsensical which, however, discloses a sense serving to illustrate and represent some other actual absurdity and nonsense.

Has the employment of contradiction in the technique of wit always this meaning? Here is another example which answers this affirmatively. On an occasion when Phocion's speech was applauded he turned to his friends and asked: *"Did I say something foolish?"*

This question seems paradoxical, but we immediately comprehend its meaning. "What have I said that has pleased this stupid crowd? I ought really to be ashamed of the applause, for if it appealed to these fools, it could not have been very clever after all."

Other examples teach us that absurdity is used very often in the technique of wit without serving at all the purpose of uncovering another piece of nonsense.

A well-known university teacher who was wont to spice richly with jokes his rather dry specialty was once congratulated upon the birth of his youngest son, who was bestowed upon him at a rather advanced age. "Yes," said he to the well-wishers, "it is remarkable what mortal hands can accomplish." This reply seems especially meaningless and out of place, for children are called the blessings of God to distinguish them from creations of mortal hands. But it soon dawns upon us that this answer has a meaning and an obscene one at that. The point in question is not that the happy father wishes to appear stupid in order to make something else

or some other persons appear stupid. The seemingly senseless answer causes us astonishment. It puzzles us, as the authors would have it. We have seen that the authors deduce the entire mechanism of such jokes from the change of the succession of "clearness and confusion." We shall try to form an opinion about this later. Here we content ourselves by remarking that the technique of this witticism consists in advancing such confusing and senseless elements.

An especially peculiar place among the nonsense jokes is assumed by this joke of Lichtenberg.

"He was surprised that the two holes were cut in the pelts of cats just where their eyes were located." It is certainly foolish to be surprised about something that is obvious in itself, something which is really the explanation of an identity. It reminds one of a seriously intended utterance of Michelet (*The Woman*) which, as I remember it, runs as follows: *"How beautifully everything is arranged by nature. As soon as the child comes into the world it finds a mother who is ready to care for it."* This utterance of Michelet is really silly, but the one of Lichtenberg is a witticism, which makes use of the absurdity for some purpose. There is something behind it. What? At present that is something we cannot discuss.

Sophistic Faulty Thinking

We have learned from two groups of examples that the wit-work makes use of deviations from normal thought, namely, *displacement* and *absurdity,* as technical means of presenting witty expressions. It is only just to expect that other faulty thinking may find a similar application. Indeed, a few examples of this sort can be cited.

A gentleman entered a shop and ordered a fancy cake, which, however, he soon returned, asking for some liqueur in its stead. He drank the liqueur, and was about to leave without paying for it. The shopkeeper held him back. "What do you want of me?" he asked. "Please pay for the liqueur," said the shopkeeper. "But I have given you the fancy cake for it." "Yes, but you have not paid for that either." "Well, neither have I eaten it."

This little story also bears the semblance of logic which we already know as the suitable façade for faulty thinking. The error, obviously, lies in the fact that the cunning customer establishes a connection between the return of the fancy cake and its exchange for the liqueur, a connection

which really does not exist. The state of affairs may be divided into two processes which as far as the shopkeeper is concerned are independent of each other. He first took the fancy cake and returned it, so that he owes nothing for it. He then took the liqueur, for which he owes money. One might say that the customer uses the relation “for it” in a double sense, or, to speak more correctly, by means of a double sense he forms a relation which does not hold in reality. [21]

The opportunity now presents itself for making a not unimportant confession. We are here busying ourselves with an investigation of technique of wit by means of examples, and we ought to be sure that the examples which we have selected are really true witticisms. The facts are, however, that in a series of cases we fall into doubt as to whether or not the example in question may be called a joke. We have no criterion at our disposal before investigation itself furnishes one. Usage of language is unreliable and is itself in need of examination for its authority. To decide the question we can rely on nothing else but a certain “feeling,” which we may interpret by saying that in our judgment the decision follows certain criteria which are not yet accessible to our knowledge. We shall naturally not appeal to this “feeling” for substantial proof. In the case of the last-mentioned example we cannot help doubting whether we may present it as a witticism, as a sophistical witticism, or merely as a sophism. The fact is that we do not yet know wherein the character of wit lies.

On the other hand the following example, which evinces, as it were, the complementary faulty thinking, is a witticism without any doubt. Again it is a story of a marriage agent. *The agent is defending the girl he has proposed against the attacks of her prospective fiancé. “The mother-in-law does not suit me,” the latter remarks. “She is a crabbed, foolish person.” “That’s true,” replies the agent, “but you are not going to marry the mother-in-law, but the daughter.” “Yes, but she is no longer young, and she is not pretty, either.” “That’s nothing: if she is not young or pretty you can trust her all the more.” “But she hasn’t much money.” “Why talk of money? Are you going to marry money? You want a wife, don’t you?” “But she is a hunchback.” “Well, what of that? Do you expect her to have no blemishes at all?”*

It is really a question of an ugly girl who is no longer young, who has a paltry dowry and a repulsive mother, and who is besides equipped with a pretty bad deformity, relations which are not at all inviting to matrimony.

The marriage agent knows how to present each individual fault in a manner to cause one to become reconciled to it, and then takes up the unpardonable hunch back as the one fault which can be excused in any one. Here again there is the semblance of logic which is characteristic of sophisms, and which serves to conceal the faulty thinking. It is apparent that the girl possesses nothing but faults, many of which can be overlooked, but one that cannot be passed by. The chances for the marriage become very slim. The agent acts as if he removed each individual fault by his evasions, forgetting that each leaves behind some depreciation which is added to the next one. He insists upon dealing with each factor individually, and refuses to combine them into a sum-total.

A similar omission forms the nucleus of another sophism which causes much laughter, though one can well question its right to be called a joke.

A. had borrowed a copper kettle from B., and upon returning it was sued by B. because it had a large hole which rendered it unserviceable. His defense was this: "In the first place I never borrowed any kettle from B., secondly the kettle had a hole in it when I received it from B., thirdly the kettle was in perfect condition when I returned it." Each separate protest is good by itself, but taken together they exclude each other. A. treats individually what must be taken as a whole, just as the marriage agent when he deals with the imperfections of the bride. One can also say that A. uses "and" where only an "either-or" is possible.

Another sophism greets us in the following marriage agent story. *The suitor objects because the bride has a short leg and therefore limps. The agent contradicts him. "You are wrong," he says. "Suppose you marry a woman whose legs are sound and straight. What do you gain by it? You are not sure from day to day that she will not fall down, break a leg, and then be lame for the rest of her life. Just consider the pain, the excitement, and the doctor's bill. But if you marry this one nothing can happen. Here you have a finished job."*

Here the semblance of logic is very shallow, for no one will by any means admit that a "finished misfortune" is to be preferred to a mere possibility of such. The error in the stream of thought will be seen more easily in a second example.

In the temple of Cracow sat the great Rabbi N. praying with his disciples. Suddenly he emitted a cry and in response to his troubled disciples said: "The great Rabbi L. died just now in Lemberg." The

congregation thereupon went into mourning for the deceased. In the course of the next day travelers from Lemberg were asked how the rabbi had died, and what had caused his death. They knew nothing about the event, however, as, they said, they had left him in the best of health. Finally it was definitely ascertained that the Rabbi of Lemberg had not died at the hour on which Rabbi N. had felt his death telepathically, and that he was still living. A stranger seized the opportunity to banter a pupil of the Cracow rabbi about the episode. "That was a glorious exhibition that your rabbi made of himself when he saw the Rabbi of Lemberg die," he said. "Why, the man is still living!" "No matter," replied the pupil. "To look from Cracow to Lemberg was wonderful anyhow."

Here the faulty thinking common to both of the last examples is openly shown. The value of fanciful ideas is unfairly matched against reality; possibility is made equivalent to actuality. To look from Cracow to Lemberg despite the miles between would have been an imposing telepathic feat had it resulted in some truth, but the disciple gives no heed to that. It might have been possible that the Rabbi of Lemberg had died at the moment when the Rabbi of Cracow had proclaimed his death, but the pupil displaces the accent from the condition under which the teacher's act would be remarkable to the unconditional admiration of this act. *"In magnis rebus voluisse sat est"* is a similar point of view. Just as in this example reality is sacrificed in favor of possibility, so in the foregoing example the marriage agent suggests to the suitor that the possibility of the woman's becoming lame through an accident is a far more important consideration to be taken into account; whereas the question as to whether or not she is lame is put altogether into the background.

Automatic Errors of Thought

Another interesting group attaches itself to this one of sophistical faulty thinking, a group in which the faulty thinking may be designated as *automatic.* It is perhaps only a stroke of fate that all of the examples which I shall cite for this new group are again stories referring to marriage agents.

The agent brought along an assistant to a conference about a bride. This assistant was to confirm his assertions. "She is as well made as a pine tree," said the agent. "Like a pine tree," repeated the echo. "She has eyes which one must appreciate." "Wonderful eyes," confirmed the echo.

“She is cultured beyond words. She possesses extraordinary culture.” “Wonderfully cultured,” repeated the assistant. “However, one thing is true,” confessed the agent. “She has a slight hunch on her back.” “And what a hunch!” confirmed the echo.

The other stories are quite analogous to this one, but they are cleverer.

On being introduced to his prospective bride the suitor was rather unpleasantly surprised, and drawing aside the marriage agent he reproachfully whispered to him: “Why have you brought me here? She is ugly and old. She squints, has bad teeth, and bleary eyes.” “You can talk louder,” interrupted the agent. “She is deaf, too.”

A prospective bridegroom made his first call on his future bride in company with the agent, and while in the parlor waiting for the appearance of the family the agent drew the young man’s attention to a glass closet containing a handsome silver set. “Just look at these things,” he said. “You can see how wealthy these people are.” “But is it not possible that these articles were just borrowed for the occasion,” inquired the suspicious young man, “so as to give the appearance of wealth?” “What an idea,” answered the agent protestingly. “Who in the world would lend them anything?”

In all three cases one finds the same thing. A person who reacts several times in succession in the same manner continues in the same manner on the next occasion where it becomes unsuited and runs contrary to his intentions. Falling into the automatism of habit he fails to adapt himself to the demands of the situation. Thus in the first story the assistant forgot that he was taken along in order to influence the suitor in favor of the proposed bride, and as he had thus far accomplished his task by emphasizing through repetition the excellencies attributed to the lady, he now emphasizes also her timidly conceded hunch back which he should have belittled.

The marriage agent in the second story is so fascinated by the failings and infirmities of the bride that he completes the list from his own knowledge, which it was certainly neither his business nor his intention to do. Finally in the third story he is so carried away by his zeal to convince the young man of the family’s wealth that in order to corroborate his proofs he blurts out something which must upset all his efforts. Everywhere the automatism triumphs over the appropriate variation of thought and expression.

That is quite easy to understand, although it must cause confusion when it is brought to our attention that these three stories could just as well be termed “comical” as “witty.” Like every act of unmasking and self-betrayal the discovery of the psychic automatism also belongs to technique of the comic. We suddenly see ourselves here confronted with the problem of the relationship of wit to the comic element — a subject which we endeavored to avoid (see the Introduction). Are these stories only “comical” and not “witty” also? Does the comic element employ here the same means as does the wit? And again, of what does the peculiar character of wit consist?

We must adhere to the fact that the technique of the group of witticisms examined last consists of nothing else but the establishment of “faulty thinking.” We are forced to admit, however, that so far the investigation has led us further into darkness than to illumination. Nevertheless we do not abandon the hope of arriving at a result by means of a more thorough knowledge of the technique of wit which may become the starting-point for further insight.

Unification

The next examples of wit with which we wish to continue our investigation do not give us as much work. Their technique reminds us very much of what we already know. Here is one of Lichtenberg’s jokes. *“January,”* he says, *“is the month in which one extends good wishes to his friends, and the rest are months in which the good wishes are not fulfilled.”*

As these witticisms may be called clever rather than strong, we shall reinforce the impression by examining a few more.

“Human life is divided into two halves; during the first one looks forward to the second, and during the second one looks backward to the first.”

“Experience consists in experiencing what one does not care to experience.” (The last two examples were cited by K. Fischer.)

One cannot help being reminded by these examples of a group, treated of before, which is characterized by the “manifold application of the same material.” The last example especially will cause us to ask why we have not inserted it there instead of presenting it here in a new connection. “Experience” is described through its own terms just as some of the

examples cited above. Neither would I be against this correction. However, I am of the opinion that the other two cases, which are surely similar in character, contain a different factor which is more striking and more important than the manifold application of the same word which shows nothing here touching upon double meaning. And what is more, I wish to emphasize that new and unexpected identities are here formed which show themselves in relations of ideas to one another, in relations of definitions to each other, or to a common third. I would call this process *unification.* Obviously it is analogous to condensation by compression into similar words. Thus the two halves of human life are described by the inter-relationship discovered between them: during the first part one longs for the second, and in the second one longs for the first. To speak more precisely there were two relationships very similar to each other which were selected for description. The similarity of the relationship that corresponds to the similarity of the words which, just for this reason, might recall the manifold application of the same material — (looks forward) (=looks backward).

In Lichtenberg's joke, January and the months contrasted with it are characterized again by a modified relationship to a third factor: these are good wishes which one receives in the first month, but are not fulfilled during the other months. The differentiation from the manifold application of the same material which is really related to double meaning is here quite clear.

A good example of unification-wit needing no explanation is the following:

J. B. Rousseau, the French poet, wrote an ode to posterity (*à la postérité*). *Voltaire, thinking that the poor quality of the poem in no way justified its reaching posterity, wittily remarked, "This poem will not reach its destination"* (K. Fischer).

The last example may remind us of the fact that it is essentially unification which forms the basis of the so-called repartee in wit. For ready repartee consists in using the defense for aggression and in "turning the tables" or in "paying with the same coin." That is, the repartee consists in establishing an unexpected identity between attack and counter-attack.

For example, *a baker said to a tavern keeper, one of whose fingers was festering: "I guess your finger got into your beer." The tavern keeper*

replied: "You are wrong. One of your rolls got under my finger nail" (Ueberhorst: *Das Komische,* II, 1900).

While Serenissimus was traveling through his domains he noticed a man in the crowds who bore a striking resemblance to himself. He beckoned him to come over and asked: *"Was your mother ever employed in my home?" "No, sire,"* replied the man, *"but my father was."*

While Duke Karl of Würtemberg was riding horseback he met a dyer working at his trade. *"Can you color my white horse blue?" "Yes, sire,"* was the rejoinder, *"if the animal can stand the boiling!"*

In this excellent repartee, which answers a foolish question with a condition that is equally impossible, there occurs another technical factor which would have been omitted if the dyer's reply had been: "No, sire, I am afraid that the horse could not stand being boiled."

Another peculiarly interesting technical means at the disposal of unification is the addition of the conjunction "and." Such correlation signifies a connection which could not be understood otherwise. When Heine (*Harzreise*) says of the city of Göttingen, *"In general the inhabitants of Göttingen are divided into students, professors, Philistines, and cattle,"* we understand this combination exactly in the sense which he furthermore emphasized by adding: "These four social groups are distinguished little less than sharply." Again, when he speaks about the school where he had to submit *"to so much Latin, drubbing, and geography,"* he wants to convey by this combination, which is made very conspicuous by placing the drubbing between the two studies, that the schoolboy's conception unmistakably described by the drubbing should be extended also to Latin and geography.

In Lipps's book we find among the examples of "witty enumeration" (Koordination) the following verse, which stands nearest to Heine's "students, professors, Philistines, and cattle."

"With a fork and with much effort his mother pulled him from a mess."

"As if effort were an instrument like the fork," adds Lipps by way of explanation. But we get the impression that there is nothing witty in this sentence. To be sure it is very comical, whereas Heine's co-ordination is undoubtedly witty. We shall, perhaps, recall these examples later when we shall no longer be forced to evade the problem of the relationship between wit and the comic.

Representation Through the Opposite

We have remarked in the example of the Duke and the dyer that it would still have been a joke by means of unification had the dyer replied, "No, I fear that the horse could not stand being boiled." In substituting a "yes" for the "no" which rightly belonged there, we meet a new technical means of wit the application of which we shall study in other examples.

This joke, which resembles the one we have just cited from K. Fischer, is somewhat simpler. *"Frederick the Great heard of a Silesian clergyman who had the reputation of communicating with spirits. He sent for him and received him with the following question: 'Can you call up ghosts?' 'At your pleasure, your majesty,' replied the clergyman, 'but they won't come.'"* Here it is perfectly obvious that the wit lies in the substitution of its opposite for the only possible answer, "No." To complete this substitution "but" had to be added to "yes," so that "yes" plus "but" gives the equivalent for "no."

This "representation through the opposite," as we choose to call it, serves the mechanism of wit in several ways. In the following cases it appears almost in its pure form:

"This woman resembles Venus de Milo in many points. Like her she is extraordinarily old, has no teeth, and has white spots on the yellow surface of her body" (Heine).

Here ugliness is depicted by making it agree with the most beautiful. Of course these agreements consist of attributes expressed in double meaning or of matters of slight importance. The latter applies to the second example.

"The attributes of the greatest men were all united in himself. Like Alexander his head was tilted to one side: like Cæsar he always had something in his hair. He could drink coffee like Leibnitz, and once settled in his armchair he forgot eating and drinking like Newton, and like him had to be awakened. He wore a wig like Dr. Johnson, and like Cervantes the fly of his trousers was always open" (Lichtenberg: *The Great Mind*).

J. V. Falke's *Lebenserinnerungen an eine Reise nach Ireland* (page 271) furnishes an exceptionally good example of "representation through the opposite" in which the use of words of a double meaning plays absolutely no part. The scene is laid in a wax figure museum, like Mme. Tussaud's. A lecturer discourses on one figure after another to his audience, which is composed of old and young people. *"This is the Duke of Wellington and*

his horse," he says. Whereupon a young girl remarks, *"Which is the duke and which is the horse?" "Just as you like, my pretty child,"* is the reply. *"You pay your money and you take your choice."*

The reduction of this Irish joke would be: "It is gross impudence on the part of the museum's management to offer such an exhibition to the public. It is impossible to distinguish between the horse and the rider (playful exaggeration), and it is for this exhibit that one pays one's hard-earned money!" The indignant expression is now dramatized and applied to a trivial occurrence. In the place of the entire audience there appears one woman and the riding figure becomes individually determined. It is necessarily the Duke of Wellington, who is so very popular in Ireland. But the insolence of the museum proprietor or lecturer who takes money from the public and offers nothing in return is represented by the opposite, through a speech, in which he extols himself as a conscientious business man whose fondest desire is to respect the rights to which the public is entitled through the admission fee. One then realizes that the technique of this joke is not very simple. In so far as a way is found to allow the swindler to assert his scrupulosity it may be said that the joke is a case of "representation through the opposite." The fact, however, that he does it on an occasion where something different is demanded of him, and the fact that he replies in terms of commercial integrity when he is expected to discuss the similarity of the figures, shows that it is a case of displacement. The technique of the joke lies in the combination of both technical means.

Outdoing-wit

This example is closely allied to another small group which might be called "outdoing-wit." Here "yes," which would be proper in the reduction, is replaced by "no," which, owing to its context, is equivalent to a still stronger "yes." The same mechanism holds true when the case is reversed. The contradiction takes the place of an exaggerated confirmation. An example of this nature is seen in the following epigram from Lessing. [22]

"The good Galathee! 'Tis said that she dyes her hair black, yet it was black when she bought it."

Lichtenberg's make-believe mocking defense of philosophy is another example.

“There are more things in heaven and earth than are dreamt of in your philosophy,” Prince Hamlet had disdainfully declared. Lichtenberg well knew that this condemnation was by no means severe enough, in that it does not take into account all that can be said against philosophy. He therefore added the following: *“But there is also much in philosophy which is found neither in heaven nor on earth.”* To be sure, his assertion supplements what was lacking in Hamlet’s philosophical utterance, but in doing this he adds another and still greater reproach.

More transparent still, because they show no trace of displacement, are two Jewish jokes which are, however, of the coarse kind.

Two Jews were conversing about bathing. “I take a bath once a year,” said one, “whether I need one or not.”

It is clear that this boastful assurance of his cleanliness only betrays his state of uncleanliness.

A Jew noticed remnants of food on the beard of another. “I can tell you what you ate yesterday,” he remarked. “Well, let’s hear it,” said another. “Beans,” said the first one. “You are wrong,” responded the other. “I had beans the day before yesterday.”

The following example is an excellent “outdoing” witticism which can be traced easily to representation through the opposite.

The king condescended to pay a visit at a surgical clinic, and found the professor of surgery engaged in amputating a leg. He watched the various steps of the operation with interest and expressed his royal approval with these loud utterances: “Bravo, bravo, Professor.” When the operation was over the professor approached the king, bowed low, and asked: “Does your majesty also command the amputation of the other leg?”

Whatever the professor may have thought during this royal applause surely could not have been expressed unchanged. His real thoughts were: “Judging by this applause he must be under the impression that I am amputating the poor devil’s diseased leg by order of and for the pleasure of the king. To be sure, I have other reasons for performing this operation.” But instead of expressing these thoughts he goes to the king and says: “I have no other reasons but your majesty’s order for performing this operation. The applause you accorded me has inspired me so much that I am only awaiting your majesty’s command to amputate the other leg also.” He thus succeeded in making himself understood by expressing the opposite of what he really thought but had to keep to himself. Such an

expression of the opposite represents an incredible exaggeration or outdoing.

As we gather from these examples, representation through the opposite is a means frequently and effectively used in the technique of wit. We need not overlook, however, something else, namely, that this technique is by no means confined only to wit. When Marc Antony, after his long speech in the Forum had changed the mood of the mob listening to Cæsar's obsequies, at last repeats the words,

"For Brutus was an honorable man,"

he well knows that the mob will scream the true meaning of his words at him, namely,

"They are traitors: nice honorable men!"

Or when *Simplicissimus* transcribes a collection of unheard-of brutalities and cynicisms as expressions of "people with temperaments," this, too, is a representation through the opposite. However, this is no longer designated as wit, but as "irony." Indeed, the only technique that is characteristic of irony is representation through the opposite. Besides, one reads and hears about "ironical wit." Hence there is no longer any doubt that technique alone is not capable of characterizing wit. There must be something else which we have not yet discovered. On the other hand, however, the fact that the reduction of the technique destroys the wit still remains uncontradicted. For the present it may be difficult for us to unite for the explanation of wit the two strong points which we have already gained.

Indirect Expression

Since representation through the opposite belongs to the technical means of wit, we may also expect that wit could make use of its reverse, namely, the representation through the similar and cognate. Indeed, when we continue our investigation we find that this forms the technique of a new and especially extensive group of thought-witticisms. We can describe the peculiarity of this technique much better if instead of representation through the "cognate" we use the expression representation through "relationships and associations." We shall start with the last characteristic and illustrate it by an example.

Indirect Expression with Allusion

It is an American anecdote and runs as follows. *By undertaking a series of risky schemes, two not very scrupulous business men had succeeded in amassing an enormous fortune and were now intent on forcing their way into good society. Among other things they thought it advisable to have their portraits painted by the most prominent and most expensive painters in the city, men whose works were considered masterpieces. The costly pictures were exhibited for the first time at a great evening gathering, and the hosts themselves led the most prominent connoisseur and art critic to the wall of the salon on which both portraits were hanging side by side, in order to elicit from him a favorable criticism. He examined the portraits for a long time, then shook his head as if he were missing something. At length he pointed to the bare space between the pictures, and asked, "And where is the Savior?"*

The meaning of this expression is clear. It is again the expression of something which cannot be represented directly. In what way does this "indirect expression" come about? By a series of very obvious associations and conclusions let us work backwards from the verbal setting.

The query, "*where is the Savior?*" or "*where is the picture of the Savior?*" arouses the conjecture that the two pictures have reminded the speaker of a similar arrangement familiar to him as it is familiar to us. This arrangement, of which one element is here missing, shows the figure of the Savior between two other figures. There is only one such case: Christ hanging between the two thieves. The missing element is emphasized by the witticism, and the similarity rests in the figures at the right and left of the Savior, which are not mentioned in the jest. It can only mean that the pictures hanging in the drawing-room are likewise those of thieves. This is what the critic wished to, but could not say, "You are a pair of scoundrels," or more in detail, "What do I care about your portraits? You are a pair of scoundrels, that I know." And by means of a few associations and conclusive inferences he has said it in a manner which we designate as "allusion."

We immediately remember that we have encountered the process of allusion before. Namely, in double meaning, when one of the two meanings expressed by the same word stands out very prominently, because being used much oftener and more commonly, our attention is

directed to it first, whereas the other meaning remains in the background because it is more remote — such cases we wished to describe as double meaning with allusion. In an entire series of examples which we have hitherto examined, we have remarked that their technique is not simple and we realized that the process of allusion was the factor that complicated it. For example, see the contradiction-witticism in which the congratulations on the birth of the youngest child are acknowledged by the remark that it is remarkable what human hands can accomplish (p. 77).

In the American anecdote we have the process of allusion without the double meaning, and we find that the character of this process consists in completing the picture through mental association. It is not difficult to guess that the utilized association can be of more than one kind. So as not to be confused by large numbers we shall discuss only the most pronounced variations, and shall give only a few examples.

The association used in the substitution may be a mere sound, so that this sub-group may be analogous to word-wit in the pun. However, it is not similarity in sound of two words, but of whole sentences, characteristic combinations of words, and similar means.

For example, Lichtenberg coined the saying: *"New baths heal well,"* which immediately reminds one of the proverb, *"New brooms clean well,"* whose first and last words, as well as whose whole sentence structure, is the same as in the first saying. It has undoubtedly arisen in the witty thinker's mind as an imitation of the familiar proverb. Thus Lichtenberg's saying is an allusion to the latter. By means of this allusion something is suggested that cannot be frankly said, namely, that the efficacy of the baths taken as cures is due to other things beside the thermal springs whose attributes are the same everywhere.

The solution of the technique of another one of Lichtenberg's jokes is similar: *"The girl barely twelve modes old."* That sounds something like the chronological term *"twelve moons"* (i.e., months), and may originally have been a mistake in writing in the permissible poetical expression. But there is a good deal of sense in designating the age of a feminine creature by the changing modes instead of by the changing of moons.

The connection of similarity may even consist of a single slight modification. This technique again runs parallel with a word-technique. Both kinds of witticisms create almost the identical impression, but they are more easily distinguishable by the processes of the wit-work.

The following is an example of such a word-witticism or pun. The great singer, Mary Wilt, who was famous not merely on account of the magnitude of her voice, suffered the mortification of having a title of a play, dramatized from the well-known novel of Jules Verne, serve as an allusion to her corpulency. *"The trip around the Wilt* (world) *in eighty days."*

Or: *"Every fathom a queen,"* which is a modification of the familiar Shakespearian quotation, *"Every inch a king,"* and served as an allusion to a prominent woman who was unusually big physically. There would really be no serious objection if one should prefer to classify this witticism as a substitution for condensation with modification (cf. tête-à-bête, p. 25).

Discussing the hardships of the medical profession, namely, that physicians are obliged to read and study constantly because remedies and drugs once considered efficacious are later rejected as useless, and that despite the physician's best efforts the patient often refuses to pay for the treatment, one of the doctors present remarked: *"Yes, every drug has its day,"* to which another added, *"But not every Doc gets his pay."* These two witty remarks are both modifications with allusion of the well-known saying, *"Every dog has his day."* But here, too, the technique could be described as fusion with modification.

If the modification contents itself with a change in letters, allusions through modifications are barely distinguishable from condensation with substitutive formation, as shown in this example: *"Mellingitis," the allusion to the dangerous disease meningitis, refers to the danger which the conservative members of a provincial borough in England thought impended if the socialist candidate Mellon were elected.*

The negative particles make very good allusions at the cost of very little changing. Heine referred to Spinoza as:

"My fellow *un*believer Spinoza."

"We, by the *Un*grace of God, Laborers, Bondsmen, Negroes, Serfs," etc., is a manifesto (which Lichtenberg quotes no further) of these unfortunates who probably have more right to that title than kings and dukes have to the unmodified one.

Omission

Finally *omission,* which is comparable to condensation without substitutive formation, is also a form of allusion. For in every allusion

there is really something omitted, namely, the trend of thought that leads to the allusion. It is only a question of whether the gap, or the substitute in the wording of the allusion which partly fills in the gap, is the more obvious element. Thus we come back through a series of examples from the very clear cases of omission to those of actual allusion.

Omission without substitution is found in the following example. There lived in Vienna a clever and bellicose writer whose sharp invectives had repeatedly brought him bodily assault at the hands of the persons he assailed. During a conversation about a new misdeed by one of his habitual opponents, some one said, *"When X. hears this he will receive another box on his ear."* The technique of this wit shows in the first place the confusion about the apparent contradiction, for it is by no means clear to us why a box on one's ear should be the direct result of having heard something. The contradiction disappears if one fills in the gap by adding to the remark: *"then he will write such a caustic article against that person that, etc."* Allusions through omission and contradiction are thus the technical means of this witticism.

Heine remarked about some one: *"He praises himself so much that pastils for fumigation are advancing in price."* This omission can easily be filled in. What has been omitted is replaced by an inference which then strikes back as an allusion to the same. For self-praise has always carried an evil odor with it.

Once more we encounter the two Jews in front of the bathing establishment. *"Another year has passed by already,"* says one with a sigh.

These examples leave no doubt that the omission is meant as an allusion.

A still more obvious omission is contained in the next example, which is really a genuine and correct allusion-witticism. Subsequent to an artists' banquet in Vienna a joke book was given out in which, among others, the following most remarkable proverb could be read:

"A wife is like an umbrella, at worst one may also take a cab."

An umbrella does not afford enough protection from rain. The words *"at worst"* can mean only: when it is raining hard. A cab is a public conveyance. As we have to deal here with the figure of comparison, we shall put off the detailed investigation of this witticism until later on.

Heine's "Bäder von Lucca" contains a veritable wasps' nest of stinging allusions which make the most artistic use of this form of wit as polemics against the Count of Platen. Long before the reader can suspect their application, a certain theme, which does not lend itself especially to direct presentation, is preluded by allusions of the most varied material possible; e.g., in Hirsch-Hyacinth's twisting of words: You are too corpulent and I am too lean; you possess too much conceit and I the more business ability; I am a practicus and you are a diarrheticus, in fine, "You are altogether my Antipodex"— "Venus Urinia" — the thick Gudel of Dreckwall in Hamburg, etc. Then the occurrences of which the poet speaks take a turn in which it merely seems to show the impolite sportiveness of the poet, but soon it discloses the symbolic relation to the polemical intention, and in this way it also reveals itself as allusion. At last the attack against Platen bursts forth, and now the allusions to the subject of the Count's love for men seethe and gush from each one of the sentences which Heine directs against the talent and the character of his opponent, e.g.:

"Even if the Muses are not well disposed to him, he has at least the genius of speech in his power, or rather he knows how to violate him; for he lacks the free love of this genius, besides he must perseveringly run after this youth, and he knows only how to grasp the outer forms which, in spite of their beautiful rotundity, never express anything noble."

"He has the same experience as the ostrich, which considers itself sufficiently hidden when it sticks its head into the sand so that only its backside is visible. Our illustrious bird would have done better if he had stuck his backside into the sand, and had shown us his head."

Allusion is perhaps the commonest and most easily employed means of wit, and is at the basis of most of the short-lived witty productions which we are wont to weave into our conversation. They cannot bear being separated from their native soil nor can they exist independently. Once more we are reminded by the process of allusion of that relationship which has already begun to confuse our estimation of the technique of wit. The process of allusion is not witty in itself; there are perfectly formed allusions which have no claims to this character. Only those allusions which show a "witty" element are witty, hence the characteristics of wit, which we have followed even into its technique, again escape us.

I have sometimes called allusion "indirect expression," and now recognize that the different kinds of allusion with representation through

the opposite, as well as the techniques still to be mentioned, can be united into a single large group for which "indirect expression" would be the comprehensive name. Hence, *errors of thought — unification — indirect representation* — are those points of view under which we can group the techniques of thought-wit which became known to us.

Representation Through the Minute or the Minutest Element

On continuing the investigation of our material we think we recognize a new sub-group of indirect representation which though sharply defined can be illustrated only by few examples. It is that of representation through a minute or minutest element; solving the problem by bringing the entire character to full expression through a minute detail. Correlating this group with the mechanism of allusion is made possible by looking at the triviality as connected with the thing to be presented and as a result of it. For example:

A Jew who was riding in a train had made himself very comfortable; he had unbuttoned his coat, and had put his feet on the seat, when a fashionably dressed gentleman came in. The Jew immediately put on his best behavior and assumed a modest position. The stranger turned over the pages of a book, did some calculation, and pondered a moment and suddenly addressed the Jew. "I beg your pardon, how soon will we have Yom Kippur?" (*Day of Atonement*). *"Oh, oh!" said the Jew, and put his feet back on the seat before he answered.*

It cannot be denied that this representation through something minute is allied to the tendency of economy which we found to be the final common element in the investigation of the technique of word-wit.

The following example is much similar.

The doctor who had been summoned to help the baroness in her confinement declared that the critical moment had not arrived, and proposed to the baron that they play a game of cards in the adjoining room in the meantime. After a while the doleful cry of the baroness reached the ears of the men. "Ah, mon Dieu, que je souffre!" The husband jumped up, but the physician stopped him saying, "That's nothing; let us play on." A little while later the woman in labor-pains was heard again: "My God, my God, what pains!" "Don't you want to go in, Doctor?" asked the baron. "By no means, it is not yet time," answered the doctor. At last there rang

from the adjacent room the unmistakable cry, "A-a-a-ai-e-e-e-e-e-e-E-E-E!" The physician then threw down the cards and said, "Now it's time."

How the pain allows the original nature to break through all the strata of education, and how an important decision is rightly made dependent upon a seemingly inconsequential utterance — both are shown in this good joke by the successive changes in the cries of this child-bearing lady of quality.

Comparison

Another kind of indirect expression of which wit makes use is *comparison,* which we have not discussed so far because an examination of comparison touches upon new difficulties, or rather it reveals difficulties which have made their appearance on other occasions. We have already admitted that in many of the examples examined we could not banish all doubts as to whether they should really be counted as witty, and have recognized in this uncertainty a serious shock to the principles of our investigation. But in no other material do I feel this uncertainty greater and nowhere does it occur more frequently than in the case of comparison-wit. The feeling which usually says to me — and I dare say to a great many others under the same conditions — this is a joke, this may be written down as witty before even the hidden and essential character of the wit has been uncovered — this feeling I lack most. If at first I experience no hesitation in declaring the comparison to be a witticism, then the next instant I seem to think that the pleasure I thus found was of a different quality than that which I am accustomed to ascribe to a joke. Also the fact that witty comparisons but seldom can evoke the explosive variety of laughter by which a good joke proves itself makes it impossible for me to cast aside the existing doubts, even when I limit myself to the best and most effective examples.

It is easy to demonstrate that there are some especially good and effective examples of comparison which in no way give us the impression of witticisms. A beautiful example of this kind which I have not yet tired of admiring, and the impression of which still clings to me, I shall not deny myself the pleasure of citing. It is a comparison with which Ferd. Lassalle concluded one of his famous pleas (*Die Wissenschaft und die Arbeiter*): "A man like myself who, as I explained to you, had devoted his whole life to the motto 'Die Wissenschaft und die Arbeiter' (Science and

the Workingman), would receive the same impression from a condemnation which in the course of events confronts him *as would the chemist, absorbed in his scientific experiments, from the cracking of a retort. With a slight knitting of his brow at the resistance of the material, he would, as soon as the disturbance was quieted, calmly continue his labor and investigations."*

One finds a rich assortment of pertinent and witty comparisons in the writings of Lichtenberg (2 B. of the Göttingen edition, 1853). I shall take the material for our investigation from that source.

"It is almost impossible to carry the torch of truth through a crowd without singeing somebody's beard." This may seem witty, but on closer examination one notices that the witty effect does not come from the comparison itself but from a secondary attribute of the same. For the expression "the torch of truth" is no new comparison, but one which has been used for a long time and which has degenerated into a fixed phrase, as always happens when a comparison has the luck to be absorbed into the common usage of speech. But whereas we hardly notice the comparison in the saying, "the torch of truth," its original full force is restored it by Lichtenberg, since by building further on the comparison it results in a deduction. But the taking of blurred expressions in their full sense is already known to us as a technique of wit; it finds a place with the Manifold Application of the Same Material (p. 35). It may well be that the witty impression created by Lichtenberg's sentence is due only to its relation to this technique of wit.

The same explanation will undoubtedly hold good for another witty comparison by the same author.

"The man was not exactly a shining light, but a great candlestick…. He was a professor of philosophy."

To call a scholar a shining light, a *"lumen mundi,"* has long ceased to be an effective comparison, whether it be originally qualified as a witticism or not. But here the comparison was freshened up and its full force was restored to it by deducting a modification from it and in this way setting up a second and new comparison. The way in which the second comparison came into existence seems to contain the condition of the witticism and not the two comparisons themselves. This would then be a case of Identical Wit Technique as in the example of the torch.

The following comparison seems witty on other but similarly classifiable grounds: *"I look upon reviews as a kind of children's disease* which more or less attacks new-born books. There are cases on record where the healthiest died of it, and the puniest have often lived through it. Many do not get it at all. Attempts have frequently been made to prevent the disease by means of *amulets of prefaces and dedications, or to color them up by personal pronunciamentos; but it does not always help."*

The comparison of reviews with children's diseases is based in the first place upon their susceptibility to attack shortly after they have seen the light of the world. Whether this makes it witty I do not trust myself to decide. But when the comparison is continued, it is found that the later fates of the new books may be represented within the scope of the same or by means of similar comparisons. Such a continuation of a comparison is undoubtedly witty, but we know already to what technique it owes its witty flavor; it is a case of *unification* or the establishment of an unexpected association. The character of the unification, however, is not changed by the fact that it consists here of a relationship with the first comparison.

Doubt in Witty Comparisons

In a series of other comparisons one is tempted to ascribe an indisputably existing witty impression to another factor which again in itself has nothing to do with the nature of the comparison. These are comparisons which are strikingly grouped, often containing a combination that sounds absurd, which comes into existence as a result of the comparison. Most of Lichtenberg's examples belong to this group.

"It is a pity that one cannot see the *learned bowels* of the writers, in order to find out what they have eaten." *"The learned bowels"* is a confusing, really absurd attribute which is made clear only by the comparison. How would it be if the witty impression of this comparison should be referred entirely and fully to the confusing character of their composition? This would correspond to one of the means of wit well known to us, namely, representation through absurdity.

Lichtenberg has used the same comparison of the imbibing of reading and educational material with the imbibing of physical nourishment.

"He thought highly of *studying in his room* and was heartily in favor of *learned stable fodder."*

The same absurd or at least conspicuous attributes, which as we are beginning to notice are the real carriers of the wit, mark other comparisons of the same author.

"This is the weatherside of my moral constitution, here I can stand almost anything."

"Every person has also his *moral backside* which he does not show *except under the stress of necessity* and which he covers as long as possible with the *pants of good-breeding."*

The "moral backside" is the peculiar attribute which exists as the result of a comparison. But this is followed by a continuation of the comparison with a regular play on words ("necessity") and a second, still more unusual combination ("the pants of good-breeding"), which is possibly witty in itself; for the pants become witty, as it were, because they are the pants of good-breeding. Therefore it may not take us by surprise if we get the impression of a very witty comparison; we are beginning to notice that we show a general tendency in our estimation to extend a quality to the whole thing when it clings only to one part of it. Besides, the "pants of good-breeding" remind us of a similar confusing verse of Heine.

"Until, at last, the buttons tore from the pants of my patience."

It is obvious that both of the last comparisons possess a character which one cannot find in all good, i.e., fitting, comparisons. One might say that they are in a large manner "debasing," for they place a thing of high category, an abstraction (good-breeding, patience), side by side with a thing of a very concrete nature of a very low kind (pants). Whether this peculiarity has something to do with wit we shall have to consider in another connection. Let us attempt to analyze another example in which the degrading character is exceptionally well defined. In Nestroy's farce *"Einen Jux will er sich machen,"* the clerk, Weinberl, who resolves in his imagination how he will ponder over his youth when he has some day become a well-established old merchant, says: *"When in the course of confidential conversation the ice is chopped up before the warehouse of memory; when the portal of the storehouse of antiquity is unlocked again; and when the mattings of phantasy are stocked full with wares of yore."* These are certainly comparisons of abstractions with very common, concrete things, but the witticism depends — exclusively or only partially — upon the circumstance that a clerk makes use of these comparisons which are taken from the sphere of his daily occupation. But to bring the

abstract in relation to the commonplace with which he is otherwise filled is an act of *unification.* Let us revert to Lichtenberg's comparisons.

Peculiar Attributions

"The motives for our actions may be arranged like the thirty-two winds, and their names may be classified in a similar way, e.g., Bread-bread-glory or Glory-glory-bread."

As so often happens in Lichtenberg's witticisms, in this case, too, the impression of appropriateness, cleverness, and ingenuity is so marked that our judgment of the character of the witty element is thereby misled. If something witty is intermingled in such an utterance with the excellent sense, we probably are deluded into declaring the whole to be an exceptional joke. Moreover, I dare say that everything that is really witty about it results from the strangeness of the peculiar combination bread-bread-glory. Thus as far as wit is concerned it is representation through absurdity.

The peculiar combination or absurd attribution can alone be represented as a product of a comparison.

Lichtenberg says: *"A twice-sleepy woman — a once-sleepy church pew."* Behind each one there is a comparison with a bed; in both cases there is besides the comparison also the technical factor of *allusion.* Once it is an allusion to the soporific effect of sermons, and the second time to the inexhaustible theme of sex.

Having found hitherto that a comparison as often as it appears witty owes this impression to its connection with one of the techniques of wit known to us, there are nevertheless some other examples which seem to point to the fact that a comparison as such can also be witty.

This is Lichtenberg's characteristic remark about certain odes. "They are in poetry what Jacob Böhm's immortal writings are in prose — *they are a kind of picnic in which the author supplies the words, and the readers the meaning."*

"When he *philosophizes,* he generally sheds *an agreeable moonlight* over his topics, which is in the main quite pleasant, but which does not show any one subject clearly."

Again, Heine's description: *"Her face resembled a kodex palimpsestus, where under the new block-lettered text of a church father peek forth the half-obliterated verses of an ancient Hellenic erotic poet."*

Or, the continued comparison of a very degrading tendency, in the "Bäder von Lucca."

"*The Catholic priest* is more like a clerk who is employed in a big business; the church, the big house at the head of which is the Pope, gives him a definite salary. He works lazily like one who is not working on his own account, he has many colleagues, and so easily remains unnoticed in the big business enterprise. He is concerned only in the credit of the house and still more in its preservation, since he would be deprived of his means of sustenance in case it went bankrupt. *The Protestant clergyman*, on the other hand, is his own boss, and carries on the religious businesses on his own account. He has no wholesale trade like his Catholic brother-tradesman, but deals merely at retail; and since he himself must understand it, he cannot be lazy. He must praise his *articles of faith* to the people and must disparage the articles of his competitors. Like a true small trader he stands in his retail store, full of envy of the industry of all large houses, particularly the large house in Rome which has so many thousand bookkeepers and packers on its payroll, and which owns factories in all four corners of the world."

In the face of this, as in many other examples, we can no longer dispute the fact that a comparison may in itself be witty, and that the witty impression need not necessarily depend on one of the known techniques of wit. But we are entirely in the dark as to what determines the witty character of the comparison, since it certainly does not cling to the similarity as a form of expression of the thought, or to the operation of the comparison. We can do nothing but include comparison with the different forms of "indirect representation" which are at the disposal of the technique of wit, and the problem, which confronted us more distinctly in the mechanism of comparison than in the means of wit hitherto treated, must remain unsolved. There must surely be a special reason why the decision whether something is a witticism or not presents more difficulties in cases of comparison than in other forms of expression.

This gap in our understanding, however, offers no ground for complaint that our first investigation has been unsuccessful. Considering the intimate connection which we had to be prepared to ascribe to the different types of wit, it would have been imprudent to expect that we could fully explain this aspect of the problem before we had cast a glance over the others. We shall have to take up this problem at another place.

Review of the Techniques of Wit

Are we sure that none of the possible techniques of wit has escaped our investigation? Not exactly; but by a continued examination of new material, we can convince ourselves that we have become acquainted with the most numerous and most important technical means of wit-work — at least with as much as is necessary for formulating a judgment about the nature of this psychic process. At present no such judgment exists; on the other hand, we have come into possession of important indications, from the direction of which we may expect a further explanation of the problem. The interesting processes of condensation with substitutive formation, which we have recognized as the nucleus of the technique of word-wit, directed our attention to the dream-formation in whose mechanism the identical psychic processes were discovered. Thither also we are directed by the technique of the thought-wit, namely displacement, faulty thinking, absurdity, indirect expression, and representation through the opposite — each and all are also found in the technique of dreams. The dream is indebted to displacement for its strange appearance, which hinders us from recognizing in it the continuation of our waking thoughts; the dream's use of absurdity and contradiction has cost it the dignity of a psychic product, and has misled the authors to assume that the determinants of dream-formation are: collapse of mental activity, cessation of criticism, morality, and logic. Representation through the opposite is so common in dreams that even the popular but entirely misleading books on dream interpretation usually put it to good account. Indirect expression, the substitution for the dream-thought by an allusion, by a trifle or by a symbolism analogous to comparison, is just exactly what distinguishes the manner of expression of the dream from our waking thoughts. [23] Such a far-reaching agreement as found between the means of wit-work and those of dream-work can scarcely be accidental. To show those agreements in detail and to trace their motivations will be one of our future tasks.

ENDNOTES.

[1] Since this joke will occupy us again and we do not wish to disturb the discussion following here, we shall find occasion later to point out a correction in Lipps's given interpretation which follows our own.

[2] The same holds true for Lipps's interpretation.

[3] *Psychoanalysis:* Its Theories and Application, 2nd Ed., p. 331.

[4] This same witticism was supposed to have been coined before by Heine concerning Alfred de Musset.

[5] One of the complications involved in the technique of this example lies in the fact that the modification through which the omitted abuse is substituted is to be taken as an allusion to the latter, for it leads to it only through a process of deduction.

[6] Another factor which I shall mention later on is also effective in the technique of this witticism. It has to do with the inner character of the modification (representation through the opposite — contradiction). The technique of wit does not hesitate to make use simultaneously of several means, with which, however, we can only become acquainted in their sequential order.

[9] Cited by Brill: *Psychoanalysis,* p. 335.

[10] l. c., p. 334.

[11] The excellence of these jokes depends upon the fact that they, at the same time, present another technical means of a much higher order.

[12] Given by Translator.

[13] This resembles an excellent joke of Oliver Wendell Holmes cited by Brill: "Put not your trust in money, but put your money in trust." A contradiction is here announced which does not appear. At all events it is a good example of the untranslatableness of the witticisms of such technique.

[14] Brill cites a very analogous modification wit: *Amantes — Amentes* (lovers — lunatics).

[15] Compare here K. Fischer (p. 85), who applies the term "double meaning" to those witticisms in which both meanings are not equally prominent, but where one overshadows the other. I have applied this term differently. Such a nomenclature is a matter of choice. Usage of speech has rendered no definite decision about them.

[16] l. c., page 339.

[17] Heine's answer is a combination of two wit-techniques — a displacement and an allusion — for he does not say directly: "He is an ox."

[18] The word "take," owing to its meanings, lends itself very well towards the formation of plays upon words, a pure example of which I wish to cite as a contrast to the displacement mentioned above. While walking with his friend, in front of a café, a well-known stock-plunger and bank director made this proposal: "Let us go in and take something." His friend held him back and said: "My dear sir, remember there are people in there."

[19] For the latter see a later chapter. It will perhaps not be superfluous to add here a few words for better understanding. The displacement regularly occurs between a statement and an answer, and turns the stream of thought to a direction different from the one started in the statement. The justification for separating the displacement from the double meaning is best seen in the examples where both are combined, that is, where the wording of the statement admits of a double meaning which was not intended by the speaker, but which reveals in the answer the way to the displacement (see examples).

[20] See Chapter III.

[21] A similar nonsense technique results when the joke aims to maintain a connection which seems to be removed through the special conditions of its content. A joke of this sort is related by J. Falke (l. c.): *"Is this the place where the Duke of Wellington spoke these words?" "Yes, this is the place; but he never spoke these words."*

[22] Following an example of the *Greek Anthology.*

III. The Tendencies of Wit

NEAR [1] the end of the preceding chapter as I was writing down Heine's comparison of the Catholic priest to an employee of a large business house, and the comparison of the Protestant divine to an independent retail dealer, I felt an inhibition which nearly prevented me from using this comparison. I said to myself that among my readers probably there would be some who hold in veneration not only religion, but also its administration and administrators. These readers might take offense at the comparison and get so wrought up about it that it would take away all interest in the investigation as to whether the comparison seemed witty in itself or was witty only through its garnishings. In other examples, e.g., the one mentioned above concerning the agreeable moonlight shed by a certain philosophy, there would be no worry that for some readers it might be a disturbing influence in our investigation. Even the most religious person would remain in the right mood to form a judgment about our problem.

It is easy to guess the character of the witticism by the kind of reaction that wit exerts on the hearer. Sometimes wit is wit for its own sake and serves no other particular purpose; then again, it places itself at the service of such a purpose, i.e., it becomes purposive. Only that form of wit which has such a tendency runs the risk of ruffling people who do not wish to hear it.

Theo. Vischer called wit without a tendency *"abstract"* wit, I prefer to call it *"harmless"* wit.

As we have already classified wit according to the material touched by its technique into word- and thought-wit, it is incumbent upon us to investigate the relation of this classification to the one just put forward. Word- and thought-wit on the one hand, and abstract- and tendency-wit on the other hand, bear no relation of dependence to each other; they are two entirely independent classifications of witty productions. Perhaps some one may have gotten the impression that harmless witticisms are preponderately word-witticisms, whereas the complicated techniques of thought-witticisms are mostly made to serve strong tendencies. There are harmless witticisms that operate through play on words and sound similarity, and just as harmless ones which make use of all means of thought-wit. Nor is it less easy to prove that tendency-wit as far as

technique is concerned may be merely the wit of words. Thus, for example, witticisms that *"play"* with proper names often show an insulting and offending tendency, and yet they, too, belong to word-wit. Again, the most harmless of all jests are word-witticisms. Examples of this nature are the popular "shake-up" rhymes (Schüttelreime) in which the technique is represented through the manifold application of the same material with a very peculiar modification:

"Having been forsaken by *Dame Luck,* he degenerated into a *Lame Duck."*

Let us hope that no one will deny that the pleasure experienced in this kind of otherwise unpretentious rhyming is of the same nature as the one by which we recognize wit.

Good examples of abstract or harmless thought-witticisms abound in Lichtenberg's comparisons with which we have already become acquainted. I add a few more. *"They sent a small Octavo to the University of Göttingen; and received back in body and soul a quarto"* (a fourth-form boy).

"In order to erect this building well, one must lay above all things a good foundation, and I know of no firmer than by laying immediately over every pro-layer a contra-layer."

"One man begets the thought, the second acts as its godfather, the third begets children by it, the fourth visits it on its death-bed, and the fifth buries it" (comparison with unification).

"Not only did he disbelieve in ghosts, but he was not ever afraid of them." The witticism in this case lies exclusively in the absurd representation which puts what is usually considered less important in the comparative and what is considered more important in the positive degree. If we divest it of its dress it says: it is much easier to use our reason and make light of the fear of ghosts than to defend ourselves against this fear when the occasion presents itself. But this rendering is no longer witty; it is merely a correct and still too little respected psychological fact suggesting what Lessing expresses in his well-known words:

"Not all are free who mock their chains."

Harmless and Tendency Wit

I shall take the opportunity presented here of clearing up what may still lead to a possible misunderstanding. “Harmless” or “abstract” wit should in no way convey the same meaning as “shallow” or “poor” wit. It is meant only to designate the opposite of the “tendency” wit to be described later. As shown in the aforementioned examples, a harmless jest, i.e., a witticism without a tendency, can also be very rich in content and express something worth while. The quality of a witticism, however, is independent of the wit and represents the quality of the thought which is here expressed wittily by means of a special contrivance. To be sure, just as watch-makers are wont to enclose very good works in valuable cases, so it may likewise happen with wit that the best witty activities are used to invest the richest thoughts.

Now, if we pay strict attention to the distinction between thought-content and the witty wording of thought-wit, we arrive at an insight which may clear up much uncertainty in our judgment of wit. For it turns out — astonishing as it may seem — that our enjoyment of a witticism is supplied by the combined impression of content and wit-activity, and that one of the factors is likely to deceive us about the extent of the other. It is only the reduction of the witticism that lays bare to us our mistaken judgment.

The same thing applies to word-wit. When we hear that *“experience consists simply of experiencing what one wishes he had not experienced,”* we are puzzled, and believe that we have learnt a new truth; it takes some time before we recognize in this disguise the platitude, “adversity is the school of wisdom” (K. Fischer). The excellent wit-activity which seeks to define “experience” by the almost exclusive use of the word “experience” deceives us so completely that we overestimate the content of the sentence. The same thing happens in many similar cases and also in Lichtenberg’s unification-witticism about January (p. 89), which expresses nothing but what we already know, namely, that New Year’s wishes are as seldom realized as other wishes.

We find the contrary true of other witticisms, in which obviously what is striking and correct in the thought captivates us, so that we call the saying an excellent witticism, whereas it is only the thought that is brilliant while the wit-activity is often weak. It is especially true of Lichtenberg’s wit that the path of the thought is often of more value than its witty expression, though we unjustly extend the value of the former to

the latter. Thus the remark about the “torch of truth” (p. 115) is hardly a witty comparison, but it is so striking that we are inclined to lay stress on the sentence as exceptionally witty.

Lichtenberg’s witticisms are above all remarkable for their thought-content and their certainty of hitting the mark. Goethe has rightly remarked about this author that his witty and jocose thoughts positively conceal problems. Or perhaps it may be more correct to say that they touch upon the solutions of problems. When, for example, he presents as a witty thought:

“He always read *Agamemnon* instead of the German word *angenommen*, so thoroughly had he read Homer” (technically this is absurdity plus sound similarity of words). Thus he discovered nothing less than the secret of mistakes in reading. [2] The following joke, whose technique (p. 78) seemed to us quite unsatisfactory, is of a similar nature.

“He was surprised that there were two holes cut in the pelts of cats just where the eyes were located.” The stupidity here exhibited is only seemingly so; in reality this ingenuous remark conceals the great problem of teleology in the structure of animals; it is not at all so self-evident that the eyelid cleft opens just where the cornea is exposed, until the science of evolution explains to us this coincidence.

Let us bear in mind that a witty sentence gave us a general impression in which we were unable to distinguish the amount of thought-content from the amount of wit-work; perhaps even a more significant parallel to it will be found later.

Pleasure Results from the Technique

For our theoretical explanation of the nature of wit, harmless wit must be of greater value to us than tendency-wit and shallow wit more than profound wit. Harmless and shallow plays on words present to us the problem of wit in its purest form, because of the good sense therein and because there is no purposive factor nor underlying philosophy to confuse the judgment. With such material our understanding can make further progress.

At the end of a dinner to which I had been invited, a pastry called Roulard was served; it was a culinary accomplishment which presupposed a good deal of skill on the part of the cook. “Is it home-made?” asked one

of the guests. "Oh, yes" replied the host, "it is a Home-Roulard" (Home Rule).

This time we shall not investigate the technique of this witticism, but shall center our attention upon another, and that one the most important factor. As I remember, this improvised joke delighted all the guests and made us laugh. In this case, as in countless others, the feeling of pleasure of the hearer cannot have originated from any purposive element nor the thought-content of the wit; so we are forced to connect the feeling of pleasure with the technique of wit. The technical means of wit which we have described, such as condensation, displacement, indirect expression, etc., have therefore the faculty to produce a feeling of pleasure in the hearer, although we cannot as yet see how they acquired that faculty. By such easy stages we get the second axiom for the explanation of wit; the first one (p. 17) states that the character of wit depends upon the mode of expression. Let us remember also that the second axiom has really taught us nothing new. It merely isolates a fact that was already contained in a discovery which we made before. For we recall that whenever it was possible to reduce the wit by substituting for its verbal expression another set of words, at the same time carefully retaining the sense, it not only eliminated the witty character but also the laughableness (*Lacheffekt*) that constitutes the pleasure of wit.

At present we cannot go further without first coming to an understanding with our philosophical authorities.

The philosophers who adjudge wit to be a part of the comic and deal with the latter itself in the field of æsthetics, characterize the æsthetic presentation by the following conditions: that we are not thereby interested in or about the objects, that we do not need these objects to satisfy our great wants in life, but that we are satisfied with the mere contemplation of the same, and with the pleasure of the thought itself. "This pleasure, this mode of conception is purely æsthetical, it depends entirely on itself, its end is only itself and it fulfills no other end in life" (K. Fischer, p. 68).

We scarcely venture a contradiction to K. Fischer's words — perhaps we merely translate his thoughts into our own mode of expression — when we insist that the witty activity is, after all, not to be designated as aimless or purposeless, since it has for its aim the evocation of pleasure in the hearer. I doubt whether we are able to undertake anything which has no

object in view. When we do not use our psychic apparatus for the fulfillment of one of our indispensable gratifications, we let it work for pleasure, and we seek to derive pleasure from its own activity. I suspect that this is really the condition which underlies all æsthetic thinking, but I know too little about æsthetics to be willing to support this theory. About wit, however, I can assert, on the strength of the two impressions gained before, that it is an activity whose purpose is to derive pleasure — be it intellectual or otherwise — from the psychic processes. To be sure, there are other activities which accomplish the same thing. They may be differentiated from each by the sphere of psychic activity from which they wish to derive pleasure, or perhaps by the methods which they use in accomplishing this. At present we cannot decide this, but we firmly maintain that at last we have established a connection between the technique of wit partly controlled by the tendency to economize (p. 53) and the production of pleasure.

But before we proceed to solve the riddle of how the technical means of wit-work can produce pleasure in the hearer, we wish to mention that, for the sake of simplicity and more lucidity, we have altogether put out of the way all tendency witticisms. Still we must attempt to explain what the tendencies of wit are and in what manner wit makes use of these tendencies.

Hostile and Obscene Wit

We are taught above all by an observation not to put aside the tendency-wit when we are investigating the origin of the pleasure in wit. The pleasurable effect of harmless wit is usually of a moderate nature; all that it can be expected to produce in the hearer is a distinct feeling of satisfaction and a slight ripple of laughter; and as we have shown by fitting examples (p. 132) at least a part of this effect is due to the thought-content. The sudden irresistible outburst of laughter evoked by the tendency-wit rarely follows the wit without a tendency. As the technique may be identical in both, it is fair to assume that by virtue of its purpose, the tendency-wit has at its disposal sources of pleasure to which harmless wit has no access.

It is now easy to survey wit-tendencies. Wherever wit is not a means to its end, i.e., harmless, it puts itself in the service of but two tendencies which may themselves be united under one viewpoint; it is either *hostile*

wit serving as an aggression, satire, or defense, or it is *obscene* wit serving as a sexual exhibition. Again it is to be observed that the technical form of wit — be it a word- or thought-witticism — bears no relation to these two tendencies.

It is a much more complicated matter to show in what way wit serves these tendencies. In this investigation I wish to present first not the hostile but the exhibition wit. The latter has indeed very seldom been deemed worthy of an investigation, as if an aversion had transferred itself here from the material to the subject; however, we shall not allow ourselves to be misled thereby, for we shall soon touch upon a detail in wit which promises to throw light on more than one obscure point.

We all know what is meant by a "smutty" joke. It is the intentional bringing into prominence of sexual facts or relations through speech. However, this definition is no sounder than other definitions. A lecture on the anatomy of the sexual organs or on the physiology of reproduction need not, in spite of this definition, have anything in common with an obscenity. It must be added that the smutty joke is directed toward a certain person who excites one sexually, and who becomes cognizant of the speaker's excitement by listening to the smutty joke, and thereby in turn becomes sexually excited. Instead of becoming sexually excited the listener may react with shame and embarrassment, which merely signifies a reaction against the excitement and indirectly an admission of the same. The smutty joke was originally directed against the woman and is comparable to an attempt at seduction. If a man tells or listens to obscene jokes in male society, the original situation, which cannot be realized on account of social inhibitions, is thereby also represented. Whoever laughs at a smutty joke does the same as the spectator who laughs at a sexual aggression.

The sexual element which is at the basis of the obscene joke comprises more than that which is peculiar to both sexes, and goes beyond that which is common to both sexes, it is connected with all these things that cause shame, and includes the whole domain of the excrementitious. However, this was the sexual domain of childhood, where the imagination fancied a cloaca, so to speak, within which the sexual elements were either badly or not at all differentiated from the excrementitious. [3] In the whole mental domain of the psychology of the neuroses, the sexual still includes the excrementitious, and it is understood in the old, infantile sense.

The smutty joke is like the denudation of a person of the opposite sex toward whom the joke is directed. Through the utterance of obscene words the person attacked is forced to picture the parts of the body in question, or the sexual act, and is shown that the aggressor himself pictures the same thing. There is no doubt that the original motive of the smutty joke was the pleasure of seeing the sexual displayed.

It will only help to clarify the subject if here we go back to the fundamentals. One of the primitive components of our libido is the desire to see the sexual exposed. Perhaps this itself is a development — a substitution for the desire to touch which is assumed to be the primary pleasure. As it often happens, the desire to see has here also replaced the desire to touch. [4] The libido for looking and touching is found in every person in two forms, active and passive, or masculine and feminine; and in accordance with the preponderance of sex characteristics it develops preponderately in one or the other direction. In young children one can readily observe the desire to exhibit themselves nude. If the germ of this desire does not experience the usual fate of being covered up and repressed, it develops into a mania for exhibitionism, a familiar perversion among grown-up men. In women the passive desire to exhibit is almost regularly covered by the masked reaction of sexual modesty; despite this, however, remnants of this desire may always be seen in women's dress. I need only mention how flexible and variable convention and circumstances make that remaining portion of exhibitionism still allowed to women.

The Transformation of the Obscenity into Obscene Wit

In the case of men a great part of this striving to exhibit remains as a part of the libido and serves to initiate the sexual act. If this striving asserts itself on first meeting the woman it must make use of speech for two motives. First, in order to make itself known to the woman; and secondly, because the awakening of the imagination through speech puts the woman herself in a corresponding excitement and awakens in her the desire to passive exhibitionism. This speech of courtship is not yet smutty, but may pass over into the same. Wherever the yieldingness of the woman manifests itself quickly, smutty speech is short-lived, for it gives way to the sexual act. It is different if the rapid yielding of the woman cannot be counted upon, but instead there appears the defense reaction. In that case

the sexually exciting speech changes into obscene wit as its own end; as the sexual aggression is inhibited in its progress towards the act, it lingers at the evocation of the excitement and derives pleasure from the indications of the same in the woman. In this process the aggression changes its character in the same way as any libidinous impulse confronted by a hindrance; it becomes distinctly hostile and cruel, and utilizes the sadistical components of the sexual impulse against the hindrance.

Thus the unyieldingness of the woman is therefore the next condition for the development of smutty wit; to be sure, this resistance must be of the kind to indicate merely a deferment and make it appear that further efforts will not be in vain. The ideal case of such resistance on the part of the woman usually results from the simultaneous presence of another man, a third person, whose presence almost excludes the immediate yielding of the woman. This third person soon becomes of the greatest importance for the development of the smutty wit, but next to him the presence of the woman must be taken account of. Among rural people or in the ordinary hostelry one can observe that not till the waitress or the hostess approaches the guests does the obscene wit come out; in a higher order of society just the opposite happens, here the presence of a woman puts an end to smutty talk. The men reserve this kind of conversation, which originally presupposed the presence of bashful women, until they are alone, "by themselves." Thus gradually the spectator, now turned the listener, takes the place of the woman as the object of the smutty joke, and through such a change the smutty joke already approaches the character of wit.

Henceforth our attention may be centered upon two factors, first upon the rôle that the third person — the listener — plays, and secondly, upon the intrinsic conditions of the smutty joke itself.

Tendency-wit usually requires three persons. Besides the one who makes the wit there is a second person who is taken as the object of the hostile or sexual aggression, and a third person in whom the purpose of the wit to produce pleasure is fulfilled. We shall later on inquire into the deeper motive of this relationship, for the present we shall adhere to the fact which states that it is not the maker of the wit who laughs about it and enjoys its pleasurable effect, but it is the idle listener who does. The same relationship exists among the three persons connected with the smutty

joke. The process may be described as follows: As soon as the libidinous impulse of the first person, to satisfy himself through the woman, is blocked, he immediately develops a hostile attitude towards this second person and takes the originally intruding third person as his confederate. Through the obscene speech of the first person the woman is exposed before the third person, who as a listener is fascinated by the easy gratification of his own libido.

It is curious that common people so thoroughly enjoy such smutty talk, and that it is a never-lacking activity of cheerful humor. It is also worthy of notice that in this complicated process which shows so many characteristics of tendency-wit, no formal demands, such as characterize wit, are made upon "smutty wit." The unveiled nudity affords pleasure to the first and makes the third person laugh.

Not until we come to the refined and cultured does the formal determination of wit arise. The obscenity becomes witty and is tolerated only if it is witty. The technical means of which it mostly makes use is allusion, i.e., substitution through a trifle, something remotely related, which the listener reconstructs in his imagination as a full-fledged and direct obscenity. The greater the disproportion between what is directly offered in the obscenity and what is necessarily aroused by it in the mind of the listener, the finer is the witticism and the higher it may venture in good society. Besides the coarse and delicate allusions, the witty obscenity also utilizes all other means of word- and thought-wit, as can be easily demonstrated by examples.

The Function of Wit in the Service of the Tendency

It now becomes comprehensible what wit accomplishes through this service of its tendency. It makes possible the gratification of a craving (lewd or hostile) despite a hindrance which stands in the way; it eludes the hindrance and so derives pleasure from a source that has become inaccessible on account of the hindrance. The hindrance in the way is really nothing more than the higher degree of culture and education which correspondingly increases the inability of the woman to tolerate the stark sex. The woman thought of as present in the final situation is still considered present, or her influence acts as a deterrent to the men even in her absence. One often notices how cultured men are influenced by the

company of girls of a lower station in life to change witty obscenities to broad smut.

The power which renders it difficult or impossible for the woman, and in a lesser degree for the man, to enjoy unveiled obscenities we call "repression," and we recognize in it the same psychic process which keeps from consciousness in severe nervous attacks whole complexes of emotions with their resultant affects, and has shown itself to be the principal factor in the causation of the so-called psychoneuroses. We acknowledge to culture and higher civilization an important influence in the development of repressions, and assume that under these conditions there has come about a change in our psychic organization which may also have been brought along as an inherited disposition. In consequence of it, what was once accepted as pleasureful is now counted unacceptable and is rejected by means of all the psychic forces. Owing to the repression brought about by civilization many primary pleasures are now disapproved by the censor and lost. But the human psyche finds renunciation very difficult; hence we discover that tendency-wit furnishes us with a means to make the renunciation retrogressive and thus to regain what has been lost. When we laugh over a delicately obscene witticism, we laugh at the identical thing which causes laughter in the ill-bred man when he hears a coarse, obscene joke; in both cases the pleasure comes from the same source. The coarse, obscene joke, however, could not incite us to laughter, because it would cause us shame or would seem to us disgusting; we can laugh only when wit comes to our aid.

What we had presumed in the beginning seems to have been confirmed, namely, that tendency-wit has access to other sources of pleasure than harmless wit, in which all the pleasure is somehow dependent upon the technique. We can also reiterate that owing to our feelings we are in no position to distinguish in tendency-wit what part of the pleasure originates from the technique and what part from the tendency. *Strictly speaking, we do not know what we are laughing about.* In all obscene jokes we succumb to striking mistakes of judgment about the "goodness" of the joke as far as it depends upon formal conditions; the technique of these jokes is often very poor while their laughing effect is enormous.

Invectives Made Possible Through Wit

We next wish to determine whether the rôle of wit in the service of the hostile tendency is the same.

Right from the start we meet with similar conditions. Since our individual childhood and the childhood of human civilization, our hostile impulses towards our fellow-beings have been subjected to the same restrictions and the same progressive repressions as our sexual strivings. We have not yet progressed so far as to love our enemies, or to extend to them our left cheek after we are smitten on the right. Furthermore, all moral codes about the subjection of active hatred bear even to-day the clearest indications that they were originally meant for a small community of clansmen. As we all may consider ourselves members of some nation, we permit ourselves for the most part to forget these restrictions in matters touching a foreign people. But within our own circles we have nevertheless made progress in the mastery of hostile emotions. Lichtenberg drastically puts it when he says: "Where nowadays one says, 'I beg your pardon,' formerly one had recourse to a cuff on the ear." Violent hostility, no longer tolerated by law, has been replaced by verbal invectives, and the better understanding of the concatenation of human emotions robs us, through its consequential *"Tout comprendre c'est tout pardonner,"* more and more of the capacity to become angry at our fellowman who is in our way. Having been endowed with a strong hostile disposition in our childhood, higher personal civilization teaches us later that it is undignified to use abusive language; even where combat is still permitted, the number of things which may be used as means of combat has been markedly restricted. Society, as the third and dispassionate party in the combat to whose interest it is to safeguard personal safety, prevents us from expressing our hostile feelings in action; and hence, as in sexual aggression, there has developed a new technique of invectives, the aim of which is to enlist this third person against our enemy. By belittling and humbling our enemy, by scorning and ridiculing him, we indirectly obtain the pleasure of his defeat by the laughter of the third person, the inactive spectator.

We are now prepared for the rôle that wit plays in hostile aggression. Wit permits us to make our enemy ridiculous through that which we could not utter loudly or consciously on account of existing hindrances; in other words, *wit affords us the means of surmounting restrictions and of opening up otherwise inaccessible pleasure sources.* Moreover, the listener will be

induced by the gain in pleasure to take our part, even if he is not altogether convinced, — just as we on other occasions, when fascinated by harmless witticism, were wont to overestimate the substance of the sentence wittily expressed. “To prejudice the laughter in one’s own favor” is a completely pertinent saying in the German language.

One may recall Mr. N.’s witticism given in the last chapter (p. 28). It is of an insulting nature, as if the author wished to shout loudly: But the minister of agriculture is himself an ox! But he, as a man of culture, could not put his opinion in this form. He therefore appealed to wit which assured his opinion a reception at the hands of the listeners which, in spite of its amount of truth, never would have been received if in an unwitty form. Brill cites an excellent example of a similar kind: *Wendell Phillips, according to a recent biography by Dr. Lorenzo Sears, was on one occasion lecturing in Ohio, and while on a railroad journey going to keep one of his appointments met in the car a number of clergymen returning from some sort of convention. One of the ministers, feeling called upon to approach Mr. Phillips, asked him, “Are you Mr. Phillips?” “I am, sir.” “Are you trying to free the niggers?” “Yes, sir; I am an abolitionist.” “Well, why do you preach your doctrines up here? Why don’t you go over into Kentucky?” “Excuse me, are you a preacher?” “I am, sir.” “Are you trying to save souls from hell?” “Yes, sir, that’s my business.” “Well, why don’t you go there?”* The assailant hurried into the smoker amid a roar of unsanctified laughter. This anecdote nicely illustrates the tendency-wit in the service of hostile aggression. The minister’s behavior was offensive and irritating, yet Wendell Phillips as a man of culture could not defend himself in the same manner as a common, ill-bred person would have done, and as his inner feelings must have prompted him to do. The only alternative under the circumstances would have been to take the affront in silence, had not wit showed him the way, and enabled him by the technical means of unification to turn the tables on his assailant. He not only belittled him and turned him into ridicule, but by his clever retort, “Well, why don’t you go there?” fascinated the other clergymen, and thus brought them to his side.

Although the hindrance to the aggression which the wit helped to elude was in these cases of an inner nature — the æsthetic resistance against insulting — it may at other times be of a purely outer nature. So it was in the case when Serenissimus asked the stranger who had a striking

resemblance to himself: “Was your mother ever in my home?” and he received the ready reply, “No, but my father was.” The stranger would certainly have felled the imprudent inquirer who dared to make an ignominious allusion to the memory of his mother; but this imprudent person was Serenissimus, who may not be felled and not even insulted unless one wishes to pay for this revenge with his life. The only thing left was to swallow the insult in silence; but luckily wit pointed out the way of requiting the insult without personally imperiling one’s self. It was accomplished simply by treating the allusion with the technical means of unification and employing it against the aggressor. The impression of wit is here so thoroughly determined by the tendency that in view of the witty rejoinder we are inclined to forget that the aggressor’s inquiry is itself made witty by allusion.

Rebellion Against Authority Through Wit

The prevention of abuse or insulting retorts through outer circumstances is so often the case that tendency-wit is used with special preference as a weapon of attack or criticism of superiors who claim to be an authority. Wit then serves as a resistance against such authority and as an escape from its pressure. In this factor, too, lies the charm of caricature, at which we laugh even if it is badly done simply because we consider its resistance to authority a great merit.

If we keep in mind that tendency-wit is so well adapted as a weapon of attack upon what is great, dignified, and mighty, that which is shielded by internal hindrances or external circumstance against direct disparagement, we are forced to a special conception of certain groups of witticisms which seem to occupy themselves with inferior and powerless persons. I am referring to the marriage-agent stories, — with a few of which we have become familiar in the investigation of the manifold techniques of thought-wit. In some of these examples, “But she is deaf, too!” and “Who in the world would ever lend these people anything!” the agent was derided as a careless and thoughtless person who becomes comical because the truth escapes his lips automatically, as it were. But does on the one hand what we have learned about the nature of tendency-wit, and on the other hand the amount of satisfaction in these stories, harmonize with the misery of the persons at whom the joke seems to be pointed? Are these worthy opponents of the wit? Or, is it not more plausible to suppose that

the wit puts the agent in the foreground only in order to strike at something more important; does it, as the saying goes, strike the saddle pack, when it is meant for the mule? This conception can really not be rejected.

The above-mentioned interpretation of the marriage-agent stories admits of a continuation. It is true that I need not enter into them, that I can content myself with seeing the farcical in these stories, and can dispute their witty character. However, such subjective determination of wit actually exists. We have now become cognizant of it and shall later on have to investigate it. It means that only that is a witticism which I wish to consider as such. What may be wit to me, may be only an amusing story to another. But if a witticism admits of doubt, that can be due only to the fact that it is possessed of a show-side, — in our examples it happens to be a façade of the comic, — upon which one may be satisfied to bestow a single glance while another may attempt to peep behind. We also suspect that this façade is intended to dazzle the prying glance which is to say that such stories have something to conceal.

At all events, if our marriage-agent stories are witticisms at all, they are all the better witticisms because, thanks to their façade, they are in a position to conceal not only what they have to say but also that they have something — forbidden — to say. But the continuation of the interpretation, which reveals this hidden part and shows that these stories having a comical façade are tendency-witticisms, would be as follows: Every one who allows the truth to escape his lips in an unguarded moment is really pleased to have rid himself of this thought. This is a correct and far-reaching psychological insight. Without the inner assent no one would allow himself to be overpowered by the automatism which here brings the truth to light. [5] The marriage agent is thus transformed from a ludicrous personage into an object deserving of pity and sympathy. How blest must be the man, able at last to unburden himself of the weight of dissimulation, if he immediately seizes the first opportunity to shout out the last fragment of truth! As soon as he sees that his case is lost, that the prospective bride does not suit the young man, he gladly betrays the secret that the girl has still another blemish which the young man had overlooked, or he makes use of the chance to present a conclusive argument in detail in order to express his contempt for the people who employ him: “Who in the world would ever lend these people anything!”

The ludicrousness of the whole thing now reverts upon the parents, — hardly mentioned in the story, — who consider such deceptions justified to clutch a man for their daughter; it also reflects upon the wretched state of the girls who get married through such contrivances, and upon the want of dignity of the marriage contracted after such preliminaries. The agent is the right person to express such criticisms, for he is best acquainted with these abuses; but he may not raise his voice, because he is a poor man whose livelihood depends altogether on turning these abuses to his advantage. But the same conflict is found in the national spirit which has given rise to these and similar stories; for he is aware that the holiness of wedlock suffers severely by reference to some of the methods of marriage-making.

We recall also the observation made during the investigation of wit-technique, namely, that absurdity in wit frequently stands for derision and criticism in the thought behind the witticism, wherein the wit-work follows the dream-work. This state of affairs, we find, is here once more confirmed. That the derision and criticism are not aimed at the agent, who appears in the former examples only as the whipping boy of the joke, is shown by another series in which the agent, on the contrary, is pictured as a superior person whose dialectics are a match for any difficulty. They are stories whose façades are logical instead of comical — they are sophistic thought-witticisms. In one of them (p. 83) the agent knows how to circumvent the limping of the bride by stating that in her case it is at least "a finished job"; another woman with straight limbs would be in constant danger of falling and breaking a leg, which would be followed by sickness, pains, and doctor's fees — all of which can be avoided by marrying the one already limping. Again in another example (p. 81) the agent is clever enough to refute by good arguments each of the whole series of the suitor's objections against the bride; only to the last, which cannot be glossed over, he rejoins, "Do you expect her to have no blemishes at all?" as if the other objections had not left behind an important remnant. It is not difficult to pick out the weak points of the arguments in both examples, a thing which we have done during the investigation of the technique. But now something else interests us. If the agent's speech is endowed with such a strong semblance of logic, which on more careful examination proves to be merely a semblance, then the truth must be lurking in the fact that the witticism adjudges the agent to be right. The

thought does not dare to admit that he is right in all seriousness, and replaces it by the semblance which the wit brings forth; but here, as it often happens, the jest betrays the seriousness of it. We shall not err if we assume that all stories with logical façades really mean what they assert even if these assertions are deliberately falsely motivated. Only this use of sophism for the veiled presentation of the truth endows it with the character of wit, which is mainly dependent upon tendency. What these two stories wish to indicate is that the suitor really makes himself ridiculous when he collects together so sedulously the individual charms of the bride which are transient after all, and when he forgets at the same time that he must be prepared to take as his wife a human being with inevitable faults; whereas, the only virtue which might make tolerable marriage with the more or less imperfect personality of the woman, — mutual attachment and willingness for affectionate adaptation, — is not once mentioned in the whole affair.

Ridicule of the suitor as seen in these examples in which the agent quite correctly assumes the rôle of superiority, is much more clearly depicted in other examples. The more pointed the stories, the less wit-technique they contain; they are, as it were, merely borderline cases of wit with whose technique they have only the façade-formation in common. However, in view of the same tendency and the concealment of the same behind the façade, they obtain the full effect of wit. The poverty of technical means makes it clear also that many witticisms of that kind cannot dispense with the comic element of jargon which acts similarly to wit-technique without great sacrifices.

The following is such a story, which with all the force of tendency-wit obviates all traces of that technique. *The agent asks: "What are you looking for in your bride?" The reply is: "She must be pretty, she must be rich, and she must be cultured." "Very well," was the agent's rejoinder. "But what you want will make three matches."* Here the reproach is no longer embodied in wit, but is made directly to the man.

In all the preceding examples the veiled aggression was still directed against persons; in the marriage-agent jokes it is directed against all the parties involved in the betrothal — the bridegroom, bride, and her parents. The object of attack by wit may equally well be institutions, persons, in so far as they may act as agents of these, moral or religious precepts, or even philosophies of life which enjoy so much respect that they can be

challenged in no other way than under the guise of a witticism, and one that is veiled by a façade at that. No matter how few the themes upon which tendency-wit may play, its forms and investments are manifold. I believe that we shall do well to designate this species of tendency-wit by a special name. To decide what name will be appropriate is possible only after analyzing a few examples of this kind.

The Witty Cynicism

I recall the two little stories about the impecunious gourmand who was caught eating "salmon with mayonnaise," and about the tippling tutor; these witty stories, which we have learned to regard as sophistical displacement-wit, I shall continue to analyze. We have learned since then that when the semblance of logic is attached to the façade of a story, the actual thought is as follows: The man is right; but on account of the opposing contradiction, I did not dare to admit the fact except for one point in which his error is easily demonstrable. The "point" chosen is the correct compromise between his right and his wrong; this is really no decision, but bespeaks the conflict within ourselves. Both stories are simply epicurean. They say, Yes, the man is right; nothing is greater than pleasure, and it is fairly immaterial in what manner one procures it. This sounds frightfully immoral, and perhaps it is, but fundamentally it is nothing more than the "*Carpe diem*" of the poet who refers to the uncertainty of life and the bareness of virtuous renunciation. If we are repelled by the idea that the man in the joke about "salmon with mayonnaise" is in the right, then it is merely due to the fact that it illustrates the sound sense of the man in indulging himself — an indulgence which seems to us wholly unnecessary. In reality each one of us has experienced hours and times during which he has admitted the justice of this philosophy of life and has reproached our system of morality for knowing only how to make claims upon us without reimbursing us. Since we no longer lend credence to the idea of a hereafter in which all former renunciations are supposed to be rewarded by gratification — (there are very few pious persons if one makes renunciation the password of faith)— "*Carpe diem*" becomes the first admonition. I am quite ready to postpone the gratification, but how do I know whether I shall still be alive to-morrow?

"Di doman' non c'e certezza." [6]

I am quite willing to give up all the paths to gratification interdicted by society, but am I sure that society will reward me for this renunciation by opening for me — even after a certain delay — one of the permitted paths? One can plainly tell what these witticisms whisper, namely, that the wishes and desires of man have a right to make themselves perceptible next to our pretentious and inconsiderate morality. And in our times it has been said in emphatic and striking terms that this morality is merely the selfish precept of the few rich and mighty who can gratify their desires at any time without deferment. As long as the art of healing has not succeeded in safeguarding our lives, and as long as the social organizations do not do more towards making conditions more agreeable, just so long cannot the voice within us which is striving against the demands of morality, be stifled. Every honest person finally makes this admission — at least to himself. The decision in this conflict is possible only through the roundabout way of a new understanding. One must be able to knit one's life so closely to that of others, and to form such an intimate identification with others, that the shortening of one's own term of life becomes surmountable; one should not unlawfully fulfill the demands of one's own needs, but should leave them unfulfilled, because only the continuance of so many unfulfilled demands can develop the power to recast the social order. But not all personal needs allow themselves to be displaced in such a manner and transferred to others, nor is there a universal and definite solution of the conflict.

We now know how to designate the witticisms just discussed; they are cynical witticisms, and what they conceal are cynicisms.

Among the institutions which cynical wit is wont to attack there is none more important and more completely protected by moral precepts, and yet more inviting of attack, than the institution of marriage. Most of the cynical jokes are directed against it. For no demand is more personal than that made upon sexual freedom, and nowhere has civilization attempted to exert a more stringent suppression than in the realm of sexuality. For our purposes a single example suffices: the "Entries in the Album of Prince Carnival" mentioned on page 108.

"A wife is like an umbrella, at worst one may always take a cab."

We have already elucidated the complicated technique of this example; it is a puzzling and seemingly impossible comparison which however, as

we now see, is not in itself witty; it shows besides an allusion (cab=public conveyance), and as the strongest technical means it also shows an omission which serves to make it still more unintelligible. The comparison may be worked out in the following manner. A man marries in order to guard himself against the temptations of sensuality, but it then turns out that after all marriage affords no gratification for one of stronger needs, just as one takes along an umbrella for protection against rain only to get wet in spite of it. In both cases one must search for better protection; in one case one must take a public cab, in the other women procurable for money. Now the wit has almost entirely been replaced by cynicism. That marriage is not the organization which can satisfy a man's sexuality, one does not dare to say loudly and frankly unless indeed it be one like Christian v. Ehrenfels, [7] who is forced to it by the love of truth and the zeal of reform. The strength of this witticism lies in the fact that it has expressed the thought even though it had to be done through all sorts of roundabout ways.

Cynical Witticisms and Self-criticism

A particularly favorable case for tendency-wit results if the intended criticism of the inner resistance is directed against one's own person, or, more carefully expressed, against a person in whom one takes interest, that is, a composite personality such as one's own people. This determination of self-criticism may make clear why it is that a number of the most excellent jokes of which we have shown here many specimens should have sprung into existence from the soil of Jewish national life. They are stories which were invented by Jews themselves and which are directed against Jewish peculiarities. The Jewish jokes made up by non-Jews are nearly all brutal buffooneries in which the wit is spared by the fact that the Jew appears as a comic figure to a stranger. The Jewish jokes which originate with Jews admit this, but they know their real shortcomings as well as their merits, and the interest of the person himself in the thing to be criticised produces the subjective determination of the wit-work which would otherwise be difficult bring about. Incidentally I do not know whether one often finds a people that makes merry so unreservedly over its own shortcomings.

As an illustration I can point to the story cited on page 112 in which the Jew in the train immediately abandons all sense of decency of deportment

as soon as he recognizes the new arrival in his coupé as his coreligionist. We have come to know this joke as an illustration by means of a detail — representation through a trifle; it is supposed to represent the democratic mode of thought of the Jew who recognizes no difference between master and servant, but unfortunately this also disturbs discipline and co-operation. Another especially interesting series of jokes presents the relationship between the poor and the rich Jews: their heroes are the "shnorrer," [8] and the charitable gentleman or the baron. *The shnorrer, who was a regular Sunday-dinner guest at a certain house, appeared one day accompanied by a young stranger, who prepared to seat himself at the table. "Who is that?" demanded the host. "He became my son-in-law last week," was the reply, "and I have agreed to supply his board for the first year."* The tendency of these stories is always the same, and is most distinctly shown in the following story. *The shnorrer supplicates the baron for money to visit the bathing resort Ostend, as the physician has ordered him to take sea-baths for his ailment. The baron remarks that Ostend is an especially expensive resort, and that a less fashionable place would do just as well. But the shnorrer rejects that proposition by saying, "Herr Baron, nothing is too expensive for my health."* That is an excellent displacement-witticism which we could have taken as a model of its kind. The baron is evidently anxious to save his money, but the shnorrer replies as if the baron's money were his own, which he may then consider secondary to his health. One is forced to laugh at the insolence of the demand, but these jokes are exceptionally unequipped with a façade to becloud the understanding. The truth is that the shnorrer who mentally treats the rich man's money as his own, really possesses almost the right to this mistake, according to the sacred codes of the Jews. Naturally the resistance which is responsible for this joke is directed against the law which even the pious find very oppressing.

Another story relates *how on the steps of a rich man's house a shnorrer met one of his own kind. The latter counseled him to depart, saying, "Do not go up to-day, the Baron is out of sorts and refuses to give any one more than a dollar." "I will go up anyway," replied the first. "Why in the world should I make him a present of a dollar? Is he making me any presents?"*

This witticism makes use of the technique of absurdity by permitting the shnorrer to declare that the baron gives him nothing at the same moment in which he is preparing to beg him for the donation. But the

absurdity is only apparent, for it is almost true that the rich man gives him nothing, since he is obligated by the mandate to give alms, and strictly speaking must be thankful that the shnorrer gives him an opportunity to be charitable. The ordinary, bourgeois conception of alms is at cross-purposes with the religious one; it openly revolts against the religious conception in the *story about the baron who, having been deeply touched by the shnorrer's tale of woe, rang for his servants and said: "Throw him out of the house; he is breaking my heart."* This obvious exposition of the tendency again creates a case of border-line wit. From the no longer witty complaint: "It is really no advantage to be a rich man among Jews. The foreign misery does not grant one the pleasure of one's own fortune," these last stories are distinguished only by the illustration of a single situation.

Other stories as the following, which, technically again presenting border-lines of wit, have their origin in a deeply pessimistic cynicism. *A patient whose hearing was defective consulted a physician who made the correct diagnosis, namely, that the patient probably drank too much whiskey and consequently was becoming deaf. He advised him to desist from drinking and the patient promised to follow his advice. Some time thereafter the doctor met him on the street and inquired in a loud voice about his condition. "Thank you, Doctor," was the reply, "there is no necessity for speaking so loudly, I have given up drinking whiskey and consequently I hear perfectly." Some time afterwards they met again. The doctor again inquired into his condition in the usual voice, but noticed that he did not make himself understood. "It seems to me that you are deaf again because you have returned to drinking whiskey," shouted the doctor in the patient's ear. "Perhaps you are right," answered the latter, "I have taken to drinking again, and I shall tell you why. As long as I did not drink I could hear, but all that I heard was not as good as the whiskey."* Technically this joke is nothing more than an illustration. The jargon and the ability of the raconteur must aid the producing of laughter. But behind it there lies the sad question, "Is not the man right in his choice?"

It is the manifold hopeless misery of the Jews to which these pessimistical stories allude, which urged me to add them to tendency-wit.

Critical and Blasphemous Witticisms

Other jokes, cynical in a similar sense, and not only stories about Jews, attack religious dogmas and the belief in God Himself. The story about the "telepathic look of the rabbi," whose technique consisted in the faulty thinking which made phantasy equal to reality, (the conception of displacement is also tenable) is such a cynical or critical witticism directed against miracle-workers and also, surely, against belief in miracles. Heine is reported to have made a directly blasphemous joke as he lay dying. *When the kindly priest commended him to God's mercy and inspired him with the hope that God would forgive him his sins, he replied: "Bien sûr qu'il me pardonnera; c'est son métier."* That is a derogatory comparison; technically its value lies only in the allusion, for a métier — business or vocation — is plied either by a craftsman or a physician, and what is more he has only a single métier. The strength of the wit, however, lies in its tendency. The joke is intended to mean nothing else, but: Certainly he will forgive me; that is what he is here for, and for no other purpose have I engaged him (just as one retains one's doctor or one's lawyer). Thus, the helpless dying man is still conscious of the fact that he has created God for himself and has clothed Him with the power in order to make use of Him as occasion arises. The so-called creature makes itself known as the Creator only a short time before his extinction.

Skeptical Wit

To the three kinds of tendency-wit discussed so far — exhibitionistic or obscene wit, aggressive or hostile wit, and cynical wit (critical, blasphemous) — I desire to add a fourth and the most uncommon of all, whose character can be elucidated by a good example.

Two Jews met in a train at a Galician railway station. "Where are you traveling?" asked one. "To Cracow," was the reply. "Now see here, what a liar you are!" said the first one, bristling. "When you say that you are traveling to Cracow, you really wish me to believe that you are traveling to Lemberg. Well, but I am sure that you are really traveling to Cracow, so why lie about it?"

This precious story, which creates an impression of exaggerated subtlety, evidently operates by means of the technique of absurdity. The second Jew has put himself in the way of being called a liar because he has said that he is traveling to Cracow, which is his real goal! However, this strong technical means — absurdity — is paired here with another

technique — representation through the opposite, for, according to the uncontradicted assertion of the first, the second one is lying when he speaks the truth, and speaks the truth by means of a lie. However, the more earnest content of this joke is the question of the conditions of truth; again the joke points to a problem and makes use of the uncertainty of one of our commonest notions. Does it constitute truth if one describes things as they are and does not concern himself with the way the hearers will interpret what one has said? Or is this merely Jesuitical truth, and does not the real truthfulness consist much more in having a regard for the hearer and of furnishing him an exact picture of his own mind? I consider jokes of this type sufficiently different from the others to assign them a special place. What they attack is not a person nor an institution, but the certainty of our very knowledge — one of our speculative gifts. Hence the name "skeptical" witticism will be the most expressive for them.

In the course of our discussion of the tendencies of wit we have gotten perhaps many an elucidation and certainly found numerous incentives for further investigations. But the results of this chapter combine with those of the preceding chapter to form a difficult problem. If it be true that the pleasure created by wit is dependent upon the technique on one hand and upon the tendency on the other hand, under what common point of view can these two utterly different pleasure-sources of wit be united?

ENDNOTES.

[1] The word tendency encountered hereafter in the expression "Tendency-Wit" (Tendenz Witz) is used adjectively in the same sense as in the familiar phrase "Tendency Play."

B. Synthesis of Wit

IV. The Pleasure Mechanism and the Psychogenesis of Wit

WE can now definitely assert that we know from what sources the peculiar pleasure arises furnished us by wit. We know that we can be easily misled to mistake our sense of satisfaction experienced through the thought-content of the sentence for the actual pleasure derived from the wit, on the other hand, the latter itself has two intrinsic sources, namely, the wit-technique and the wit-tendency. What we now desire to ascertain is the manner in which pleasure originates from these sources and the mechanism of this resultant pleasure.

It seems to us that the desired explanation can be more easily ascertained in tendency-wit than in harmless wit. We shall therefore commence with the former.

The pleasure in tendency-wit results from the fact that a tendency, whose gratification would otherwise remain unfulfilled, is actually gratified. That such gratification is a source of pleasure is self-evident without further discussion. But the manner in which wit brings about gratification is connected with special conditions from which we may perhaps gain further information. Here two cases must be differentiated. The simpler case is the one in which the gratification of the tendency is opposed by an external hindrance which is eluded by the wit. This process we found, for example, in the reply which Serenissimus received to his query whether the mother of the stranger he addressed had ever sojourned in his home, and likewise in the question of the art critic who asked: “And where is the Savior?” when the two rich rogues showed him their portraits. In one case the tendency serves to answer one insult with another; in the other case it offers an affront instead of the demanded expert opinion; in both cases the tendency was opposed by purely external factors, namely, the powerful position of the persons who are the targets of the insult. Nevertheless it may seem strange to us that these and analogous tendency-witticisms have not the power to produce a strong laughing effect, no matter how much they may gratify us.

It is different, however, if no external factors but internal hindrances stand in the way of the direct realization of the tendency, that is, if an inner feeling opposes the tendency. This condition, according to our assumption, was present in the aggressive joke of Mr. N. (p. 28) and in the one of

Wendell Phillips, in whom a strong inclination to use invectives was stifled by a highly developed æsthetic sense. With the aid of wit the inner resistances in these special cases were overcome and the inhibition removed. As in the case of external hindrances, the gratification of the tendency is made possible, and a suppression with its concomitant "psychic damming" is thus obviated. So far the mechanism of the development of pleasure would seem to be identical in both cases.

At this place, however, we are inclined to feel that we should enter more deeply into the differentiation of the psychological situation between the cases of external and internal hindrance, as we have a faint notion that the removal of the inner hindrance might possibly result in a disproportionately higher contribution to pleasure. But I propose that we rest content here, that we be satisfied for the present with this one collection of evidence which adheres to what is essential to us. The only difference between the cases of outer and inner hindrances consists in the fact that here an already existing inhibition is removed, while there the formation of a new inhibition is avoided. We hardly resort to speculation when we assert that a *"psychic expenditure"* is required for the formation as well as for the retention of a psychic inhibition. Now if we find that in both cases the use of the tendency-wit produces pleasure, then it may be assumed *that such resultant pleasure corresponds to the economy of psychic expenditure.*

Thus we are once more confronted with the principle of *economy* which we noticed first in the study of the technique of word-wit. But whereas the economy we believed to have found at first was in the use of few or possibly the same words, we can here foresee an economy of psychic expenditure in general in a far more comprehensive sense, and we think it possible to come nearer to the nature of wit through a better determination of the as yet very obscure idea of "psychic expenditure."

A certain amount of haziness which we could not dissipate during the study of the pleasure mechanism in tendency-wit we accept as a slight punishment for attempting to elucidate the more complicated problem before the simpler one, or the tendency-wit before the harmless wit. We observe that *"economy in the expenditure of inhibitions or suppressions"* seems to be the secret of the pleasurable effect of tendency-wit, and we now turn to the mechanism of the pleasure in harmless wit.

While examining appropriate examples of harmless witticisms, in which we had no fear of false judgment through content or tendency, we were forced to the conclusion that the techniques of wit themselves are pleasure-sources; now we wish to ascertain whether the pleasure may be traced to the economy in psychic expenditure. In a group of these witticisms (plays on words) the technique consisted in directing the psychic focus upon the sound instead of upon the sense of the word, and in allowing the (acoustic) word-disguise to take the place of the meaning accorded to it by its relations to reality. We are really justified in assuming that great relief is thereby afforded to the psychic work, and that in the serious use of words we refrain from this convenient procedure only at the expense of a certain amount of exertion. We can observe that abnormal mental states, in which the possibility of concentrating psychic expenditure on one place is probably restricted, actually allow to come to the foreground word-sound associations of this kind rather than the significance of the words, and that such patients react in their speech with “outer” instead of “inner” associations. Also in children who are still accustomed to treat the word as an object we notice the inclination to look for the same meaning in words of the same or of similar sounds, which is a source of great amusement to adults. If we experience in wit an unmistakable pleasure because through the use of the same or similar words we reach from one set of ideas to a distant other one, (as in “Home-Roulard” from the kitchen to politics), we can justly refer this pleasure to the economy of psychic expenditure. The pleasure of the wit resulting from such a “short-circuit” appears greater the more remote and foreign the two series of ideas which become related through the same word are to each other, or the greater the economy in thought brought about by the technical means of wit. We may add that in this case wit makes use of a means of connection which is rejected by and carefully avoided in serious thinking. [1]

A second group of technical means of wit — unification, similar sounding words, manifold application, modification of familiar idioms, allusions to quotations — all evince one common character, namely, that one always discovers something familiar where one expects to find something new instead. To discover the familiar is pleasurable and it is not difficult to recognize such pleasure as economy-pleasure and to refer it to the economy of psychic expenditure.

That the discovery of the familiar— “recognition” — causes pleasure seems to be universally admitted. Groos says: [2] “Recognition is everywhere bound up with feelings of pleasure where it has not been made too mechanical, (as perhaps in dressing…). Even the mere quality of acquaintanceship is easily accompanied by that gentle delight which Faust experiences when, after an uncanny experience, he steps into his study.” If the act of recognition is so pleasureful, we may expect that man merges into the habit of practicing this activity for its own sake, that is, he experiments playfully with it. In fact, Aristotle recognized in the joy of rediscovery the basis of artistic pleasure, and it cannot be denied that this principle must not be overlooked even if it has not such a far-reaching significance as Aristotle assumes.

Groos then discusses the games, whose character consists of heightening the pleasure of rediscovery by putting hindrances in its path, or in other words by raising a “psychic dam” which is removed by the act of recognition. However, his attempted explanation leaves the assumption that recognition as such is pleasurable, in that he attributes the pleasure of recognition connected with these games to the pleasure in power or to the surmounting of a difficulty. I consider this latter factor as secondary, and I find no occasion for abandoning the simpler explanation, that the recognition *per se,* i.e., through the alleviation of the psychic expenditure, is pleasurable, and that the games founded upon this pleasure make use of the damming-mechanism merely in order to intensify their effect.

We know also that the source of pleasure in rhyme, alliteration, refrain, and other forms of repetition of similar sounding words in poetry, is due merely to the discovery of the familiar. A “sense of power” plays no perceptible rôle in these techniques, which show so marked an agreement with the “manifold application” in wit.

Considering the close connection between recognition and remembering, the assumption is no longer daring that there exists also a pleasure in remembering, i.e., that the act of remembering in itself is accompanied by a feeling of pleasure of a similar origin. Groos seems to have no objection to such an assumption, but he again deducts the pleasure of remembering from the “sense of power” in which he seeks — as I believe unjustly — the principal basis of pleasure in almost all games.

The Factor of Actuality

The use of another technical expedient of wit, which has not yet been mentioned, is also dependent upon "the rediscovery of the familiar." I refer to the factor of *actuality* (dealing with actual persons, things, or events), which in many witticisms provides a prolific source of pleasure and explains several peculiarities in the life history of wit. There are witticisms which are entirely free from this condition, and in a treatise on wit it is incumbent upon us to make use of such examples almost exclusively. But we must not forget that we laughed perhaps more heartily over such perennial witticisms than over others; witticisms whose application now would be difficult, because they would require long commentaries, and even with that aid the former effect could not be attained. These latter witticisms contained allusions to persons and occurrences which were "actual" at the time, which had stimulated general interest and were endowed with tension. After the cessation of this interest, after the settlement of these particular affairs, the witticisms lost a part of their pleasurable effect, and a very considerable. Thus, for example, the joke which my friendly host made when he called the dish that was being served a "Home-Roulard," seems to me by no means as good now as when the question of Home Rule was a continuous headline in the political columns of our newspaper. If I now attempt to express my appreciation of this joke by stating that this one word led us from the idea of the kitchen to the distant field of politics, and saved us a long mental detour, I should have been forced at that time to change this description as follows: "That this word led us from the idea of the kitchen to the very distant field of politics; but that our lively interest was all the keener because this question was constantly absorbing us." The same thing is true of another joke: *"This girl reminds me of Dreyfus; the army does not believe in her innocence,"* which has become blurred in spite of the fact that its technical means has remained unchanged. The confusion arising from the comparison with, and the double meaning of, the word "innocence" cannot do away with the fact that the allusion, which at that time touched upon a matter pregnant with excitement, now recalls an interest set at rest. The many irresistible jokes about the present war will sink in our estimation in a very short time.

A great many witticisms in circulation reach a certain age or rather go through a course composed of a flourishing season and a mature season, and then sink into complete oblivion. The need that people feel to draw

pleasure from their mental processes continually creates new witticisms which are supported by current interests of the day. The vitality of actual witticisms is not their own, it is borrowed by way of allusion from those other interests, the expiration of which determines the fate of the witticism. The factor of actuality which may be added as a transitory pleasure-source of wit, although it is productive in itself, cannot be simply put on the same basis as the rediscovery of the familiar. It is much more a question of a special qualification of the familiar which must be aided by the quality of freshness and recency and which has not been affected by forgetfulness. In the formation of the dream one also finds that there is a special preference for what is recent, and one cannot refrain from inferring that the association with what is recent is rewarded or facilitated by a special pleasure premium.

Unification, which is really nothing more than repetition in the sphere of mental association instead of in material, has been accorded an especial recognition as a pleasure-source of wit by G. Th. Fechner. [3] He says: “In my opinion the principle of uniform connection of the manifold, plays the most important rôle in the field under discussion; it needs, however, the support of subsidiary determinations in order to drive across the threshold the pleasure with its peculiar character which the cases here belonging can furnish.” [4]

In all of these cases of repetition of the same association or of the same word-material, of re-finding the familiar and recent, we surely cannot be prevented from referring the pleasure thereby experienced to the economy in psychic expenditure; providing that this viewpoint proves fertile for the explanation of single facts as well as for bringing to light new generalities. We are fully conscious of the fact that we have yet to make clear the manner in which this economy results and also the meaning of the expression “psychic expenditure.”

The third group of the technique of wit, mostly thought-wit, which includes false logic, displacement, absurdity, representation through the opposite, and other varieties, may seem at first sight to present special features and to be unrelated to the techniques of the discovery of the familiar, or the replacing of object-associations by word-associations. But it will not be difficult to demonstrate that this group, too, shows an economy or facilitation of psychic expenditure.

It is quite obvious that it is easier and more convenient to turn away from a definite trend of thought than to stick to it; it is easier to mix up different things than to distinguish them; and it is particularly easier to travel over modes of reasoning unsanctioned by logic; finally in connecting words or thoughts it is especially easy to overlook the fact that such connections should result in sense. All this is indubitable and this is exactly what is done by the techniques of the wit in question. It will sound strange, however, to assert that such processes in the wit-work may produce pleasure, since outside of wit we can experience only unpleasant feelings of defense against all these kinds of inferior achievement of our mental activity.

Word-pleasure and Pleasure in Nonsense

The "pleasure in nonsense," as we may call it for short, is, in the seriousness of our life, crowded back almost to the vanishing point. To demonstrate it we must enter into the study of two cases in one of which it is still visible and in the other becomes visible for the second time. I refer to the behavior of the learning child and to the behavior of the adult under unstable toxic influences. When the child learns to control the vocabulary of its mother tongue it apparently takes great pleasure in "experimenting playfully" with that material (Groos); it connects words without regard for their meaning in order to obtain pleasure from the rhyme and rhythm. Gradually the child is deprived of this pleasure until only the senseful connection of words is allowed him. But even in later life there is still a tendency to overstep the acquired restrictions in the use of words, a tendency which manifests itself in disfiguring the same by definite appendages, and in changing their forms by means of certain contrivances (reduplication, trembling speech) or even by developing an individual language for use in playing, — efforts which reappear also among the insane of a certain category.

I believe that whatever the motive which actuated the child when it began such playings, in its further development the child indulges in them fully conscious that they are nonsensical and derives pleasure from this stimulus which is interdicted by reason. It now makes use of play in order to withdraw from the pressure of critical reason. More powerful, however, are the restrictions which must develop in education along the lines of right thinking and in the separation of reality from fiction, and it is for this

reason that the resistance against the pressures of thinking and reality is far-reaching and persistent; even the phenomena of phantasy formation come under this point of view. The power of reason usually grows so strong during the later part of childhood and during that period of education which extends over the age of puberty, that the pleasure in "freed nonsense" rarely dares manifest itself. One fears to utter nonsense; but it seems to me that the inclination characteristic of boys to act in a contradictory and inexpedient manner is a direct outcome of this pleasure in nonsense. In pathological cases one often sees this tendency so accentuated that it again controls the speeches and answers of the pupils. In the case of some college students who merged into neuroses I could convince myself that the unconscious pleasure derived from the nonsense produced by them is just as much responsible for their mistakes as their actual ignorance.

Reproduction of Old Liberties

The student does not give up his demonstrations against the pressures of thinking and reality whose domination becomes unceasingly intolerant and unrestricted. A good part of the tendency of students to skylarking is responsible for this reaction. Man is an "untiring pleasure seeker" — I can no longer recall which author coined this happy expression — and finds it extremely difficult to renounce pleasure once experienced. With the hilarious nonsense of "sprees" (*Bierschwefel*), college cries, and songs, the student attempts to preserve that pleasure which results from freedom of thought, a freedom of which he is more and more deprived through scholastic discipline. Even much later, when as a mature man he meets with others at scientific congresses and class reunions and feels himself a student again, he must read at the end of the session the "*Kneipzeitung,*" or the comic college paper, which distorts the newly gained knowledge into the nonsensical and thus compensates him for the newly added mental inhibitions.

The very terms "*Bierschwefel*" and "*Kneipzeitung*" are proof that the reason which has stifled the pleasure in nonsense has become so powerful that not even temporarily can it be abandoned without toxic agency. The change in the state of mind is the most valuable thing that alcohol offers man, and that is the reason why this "poison" is not equally indispensable for all people. The hilarious humor, whether due to endogenous origin or

whether produced toxically, weakens the inhibiting forces among which is reason and thus again makes accessible pleasure-sources which are burdened by suppression. It is very instructive to see how the demand made upon wit sinks with the rise in spirits. The latter actually replace wit, just as wit must make an effort to replace the mental state in which the otherwise inhibited pleasure possibilities (pleasure in nonsense among the rest) assert themselves.

"With little wit and much comfort."

Under the influence of alcohol the adult again becomes a child who derives pleasure from the free disposal of his mental stream without being restricted by the pressure of logic.

We hope we have shown that the technique of absurdity in wit corresponds to a source of pleasure. We need hardly repeat that this pleasure results from the economy of psychic expenditure or alleviation from the pressure of reason.

On reviewing again the wit-technique classified under three headings we notice that the first and last of these groups — the replacement of object-association by word-association, and the use of absurdity as a restorer of old liberties and as a relief from the pressure of intellectual upbringing — can be taken collectively. Psychic relief may in a way be compared to economy, which constitutes the technique of the second group. Alleviation of the already existing psychic expenditure, and economy in the yet to be offered psychic expenditure, are two principles from which all techniques of wit and with them all pleasure in these techniques can be deduced. The two forms of the technique and the resultant pleasures correspond more or less in general to the division of wit into word- and thought-witticisms.

Play and Jest

The preceding discussions have led us unexpectedly to an understanding of the history of the development of psychogenesis of wit which we shall now examine still further. We have become acquainted with the successive steps in wit, the development of which up to tendency-wit will undoubtedly reveal new relationships between the different characters of wit. Antedating wit there exists something which we may designate as "play" or "jest." Play — we shall retain this name — appears in children while they are learning how to use words and connect thoughts;

this playing is probably the result of an impulse which urges the child to exercise its capacities (Groos). During this process it experiences pleasurable effects which originate from the repetition of similarities, the rediscovery of the familiar, sound-associations, etc., which may be explained as an unexpected economy of psychic expenditure. Therefore it surprises no one that these resulting pleasures urge the child to practice playing and impel it to continue without regard for the meaning of words or the connections between sentences. Playing with words and thoughts, motivated by certain pleasures in economy, would thus be the first step of wit.

This playing is stopped by the growing strength of a factor which may well be called criticism or reason. The play is then rejected as senseless or as directly absurd, and by virtue of reason it becomes impossible. Only accidentally is it now possible to derive pleasure from those sources of rediscovery of the familiar, etc., which is explained by the fact that the maturing person has then merged into a playful mood which, as in the case of merriment in the child, removes inhibitions. In this way only is the old pleasure-giving playing made possible, but as men do not wish to wait for these propitious occasions and also hate to forego this pleasure, they seek means to make themselves independent of these pleasant states. The further development of wit is directed by these two impulses; the one striving to elude reason and the other to substitute for the adult an infantile state of mind.

This gives rise to the second stage of wit, the *jest* (*Scherz*). The object of the jest is to bring about the resultant pleasure of playing and at the same time appease the protesting reason which strives to suppress the pleasant feeling. There is but one way to accomplish this. The senseless combination of words or the absurd linking of thoughts must make sense after all. The whole process of wit production is therefore directed towards the discovery of words and thought constellations which fulfill these conditions. The jest makes use of almost all the technical means of wit, and usage of language makes no consequential distinction between jest (*Scherz*) and wit (*Witz*). What distinguishes the jest from wit is the fact that the pith of the sentence withdrawn from criticism does not need to be valuable, new, or even good; it matters only that it can be expressed, even though what it may say is obsolete, superfluous, and useless. The most

conspicuous factor of the jest is the gratification it affords by making possible that which reason forbids.

A mere jest is the following of Professor Kästner, who taught physics at Göttingen in the 16th century, and who was fond of making jokes. Wishing to enroll a student named Warr in his class, he asked him his age, and upon receiving the reply that he was thirty years of age he exclaimed: “Aha, so I have the honor of seeing the thirty years’ War.” [5] When asked what vocations his sons followed Rokitansky jestingly answered: “Two are healing and two are howling,” (two physicians and two singers). The reply was correct and therefore unimpeachable, but it added nothing to what is contained in the parenthetic expression. There is no doubt that the answer assumed another form only because of the pleasure which arises from the unification and assonance of both words.

I believe that we now see our way clear. In estimating the techniques of wit we were constantly disturbed by the fact that these are not peculiar to wit alone, and yet the nature of wit seemed to depend upon them, since their removal by means of reduction nullified the character as well as the pleasure of wit. Now we become aware that what we have described as techniques of wit — and which in a certain sense we shall have to continue to call so — are really the sources from which wit derives pleasure; nor does it strike us as strange that other processes draw from the same sources with the same object in view. The technique, however, which is peculiar to and belongs to wit alone consists in a process of safeguarding the use of this pleasure-forming means against the protest of reason which would obviate the pleasure. We can make few generalizations about this process. The wit-work, as we have already remarked, expresses itself in the selection of such word-material and such thought-situations as to permit the old play with words and thoughts to stand the test of reason; but to accomplish this end the cleverest use must be made of all the peculiarities of the stock of words and of all constellations of mental combinations. Later on perhaps we shall be in a position to characterize the wit-work by a definite attribute; for the present it must remain unexplained how our wit makes its advantageous selections. The tendency and capacity of wit to guard the pleasure-forming word and thought combinations against reason, already makes itself visible as an essential criterion in jests. From the beginning its object is to remove inner inhibitions and thereby render productive those pleasure-sources which

have become inaccessible, and we shall find that it remains true to this characteristic throughout the course of its entire development.

We are now in a position to prescribe a correct place for the factor "sense in nonsense," (see Introduction, page 8), to which the authors ascribe so much significance in respect to the recognition of wit and the explanation of the pleasurable effect. The two firmly established points in the determination of wit — its tendency to carry through the pleasureful play, and its effort to guard it against the criticism of reason — make it perfectly clear why the individual witticism, even though it appear nonsensical from one point of view, must appear full of meaning or at least acceptable from another. How it accomplishes this is the business of the wit-work; if it is not successful it is relegated to the category of "nonsense." Nor do we find it necessary to deduce the resultant pleasure of wit from the conflict of feelings which emerge either directly or by way of "confusion and clearness," from the simultaneous sense and nonsense of the wit. There is just as little necessity for our delving deeper into the question how pleasure can come from the succession of that part of the wit considered senseless and from that part recognized as senseful. The psychogenesis of wit has taught us that the pleasure of wit arises from word-play or from the liberation of nonsense, and that the sense of wit is meant only to guard this pleasure against suppression through reason.

Jest and Wit

Thus the problem of the essential character of wit could almost be explained by means of the jest. We may follow the development of the jest until it reaches its height in the tendency-wit. The jest gives tendency a prior position when it is a question of supplying us with pleasure, and it is content when its utterance does not appear utterly senseless or insipid. But if this utterance is substantial and valuable the jest changes into wit. A thought, which would have been worthy of our interest even when expressed in the most unpretentious form, is now invested in a form which must in itself excite our sense of satisfaction. Such an association we cannot help thinking certainly has not come into existence unintentionally; we must make effort to divine the intention at the bottom of the formation of wit. An incidental observation, made once before, will put us on the right track. We have already remarked that a good witticism gives us, so to speak, a general feeling of satisfaction without our being able to decide

offhand which part of the pleasure comes from the witty form and which part from the excellent thought contained in the context (p. 131). We are deceiving ourselves constantly about this division; sometimes we overvalue the quality of the wit on account of our admiration for the thought contained therein, and then again we overestimate the value of the thought on account of the pleasure afforded us by the witty investment. We know not what gives us pleasure nor at what we are laughing. This uncertainty of our judgment, assuming it to be a fact, may have given the motive for the formation of wit in the literal sense. The thought seeks the witty disguise because it thereby recommends itself to our attention and can thus appear to us more important and valuable than it really is; but above all because this disguise fascinates and confuses our reason. We are apt to attribute to the thought the pleasure derived from the witty form, and we are not inclined to consider improper what has given us pleasure, and in this way deprive ourselves of a source of pleasure. For if wit made us laugh it was because it established in us a mood most unfavorable to reason, which in turn has forced upon us that state of mind which was once contented with mere playing and which wit has attempted to replace with all the means at its command. Although we have already established the fact that such wit is harmless and does not yet show a tendency, we may not deny that, strictly speaking, it is the jest alone which shows no tendency; that is, it serves to produce pleasure only. For wit is really never purposeless even if the thought contained therein shows no tendency and merely serves a theoretical, intellectual interest. Wit carries out its purpose in advancing the thought by magnifying it and by guarding it against reason. Here again it reveals its original nature in that it sets itself up against an inhibiting and restrictive power, or against the critical judgment.

The first use of wit, which goes beyond the mere production of pleasure, points out the road to be followed. Wit is now recognized as a powerful psychic factor whose weight can decide the issue if it falls into this or that side of the scale. The great tendencies and impulses of our psychic life enlist its service for their own purposes. The original purposeless wit, which began as play, becomes related in a *secondary* manner to tendencies from which nothing that is formed in psychic life can escape for any length of time. We already know what it can achieve in the service of the exhibitionistic, aggressive, cynical, and sceptical

tendencies. In the case of obscene wit, which originated in the smutty joke, it makes a confederate of the third person who originally disturbed the sexual situation, by giving him pleasure through the utterance which causes the woman to be ashamed in his presence. In the case of the aggressive tendency, wit by the same means changes the original indifferent hearers into active haters and scorners, and in this way confronts the enemy with a host of opponents where formerly there was but one. In the first case it overcomes the inhibitions of shame and decorum by the pleasure premium which it offers. In the second case it overthrows the critical judgment which would otherwise have examined the dispute in question. In the third and fourth cases where wit is in the service of the cynical and sceptical tendency, it shatters the respect for institutions and truths in which the hearer had believed, first by strengthening the argument, and secondly by resorting to a new method of attack. Where the argument seeks to draw the hearer's reason to its side, wit strives to push aside this reason. There is no doubt that wit has chosen the way which is psychologically more efficacious.

The Development into Tendency-wit

What impressed us in reviewing the achievements of tendency-wit was the effect it produced on the hearer. It is more important, however, to understand the effect produced by wit on the psychic life of the person who makes it, or more precisely expressed, on the psychic life of the person who conceives it. Once before we have expressed the intention, which we find occasion to repeat here, that we wish to study the psychic processes of wit in regard to its apportionment between two persons. We can assume for the present that the psychic process aroused by wit in the hearer is usually an imitation of the psychic processes of the wit producer. The outer inhibitions which are to be overcome in the hearer correspond to the inner inhibitions of the wit producer. In the latter the expectation of the outer hindrance exists, at least as an inhibiting idea. The inner hindrance, which is overcome in tendency-wit, is evident in some single cases; for example, in Mr. N.'s joke (p. 28) we can assume that it not only enables the hearer to enjoy the pleasure of the aggression through injuries but it also makes it possible for him to produce the wit in the first place. Of the different kinds of inner inhibitions or suppressions one is especially worthy of our interest because it is the most far-reaching. We designate

that form by the term “repression.” It is characterized by the fact that it excludes from consciousness certain former emotions and their products. We shall learn that tendency-wit itself is capable of liberating pleasure from sources that have undergone repression. If the overcoming of outer hindrances can be referred, in the manner indicated above, to inner inhibitions and repressions we may say that tendency-wit proves more clearly than any other developmental stage of wit that the main character of wit-making is to set free pleasure by removing inhibitions. It reinforces tendencies to which it gives its services by bringing them assistance from repressed emotions; or it puts itself at the disposal of the repressed tendencies directly.

One may readily concede that these are the functions of tendency-wit, but one must nevertheless admit that we do not understand in what manner these functions can succeed in accomplishing their end. The power of tendency-wit consists in the pleasure which it derives from the sources of word-plays and liberated nonsense, and if one can judge from the impressions received from purposeless jests, one cannot possibly consider the amount of the pleasure so great as to believe that it has the power to annul deep-rooted inhibitions and repressions. As a matter of fact we do not deal here with a simple propelling power but rather with a more complicated mechanism. Instead of covering the long circuitous route through which I arrived at an understanding of this relationship, I shall endeavor to demonstrate it by a short synthetic route.

G. Th. Fechner has established the principle of æsthetic assistance or enhancement which he explains in the following words: “*From the unopposed meeting of pleasurable states* (*Bedingungen*) *which individually accomplish little, there results a greater, often much greater resultant pleasure than is warranted by the sum of the pleasure values of the separate states, or a greater result than could be accounted for as the sum of the individual effects; in fact the mere meeting of this kind can result in a positive pleasure product which overflows the threshold of pleasure when the factors taken separately are too weak to accomplish this. The only condition is that in comparison to others they must produce a greater sense of satisfaction.*” [6] I am of the opinion that the theme of wit does not give us the opportunity to test the correctness of this principle which is demonstrable in many other artistic fields. But from wit we have learned something, which at least comes near this principle, namely, that

in a co-operation of many pleasure-producing factors we are in no position to assign to each one the resultant part which really belongs to it (see p. 131). But the situation assumed in the principle of assistance can be varied, and for these new conditions we can formulate the following combination of questions which are worthy of a reply. What usually happens if in one constellation there is a meeting of pleasurable and painful conditions? Upon what depends the result and the previous intimations of the result? Tendency-wit particularly shows these possibilities. There is one feeling or impulse which strives to liberate pleasure from a certain source and under unrestricted conditions certainly would liberate it, but there is another impulse which works against this development of pleasure, that is, which inhibits or suppresses it. The suppressing stream, as the result shows, must be somewhat stronger than the one suppressed, which however is by no means destroyed.

The Fore-pleasure Principle

But now there appears another impulse which strives to set free pleasure by this identical process, even though from different sources it thus acts like the suppressed stream. What can be the result in such a case? An example can make this clearer than this schematization. There is an impulse to insult a certain person; but this is so strongly opposed by a feeling of decorum and æsthetic culture that the impulse to insult must be crushed. If, for example, by virtue of some changed emotional state the insult should happen to break through, this insulting tendency would subsequently be painfully perceived. Therefore the insult is omitted. There is a possibility, however, of making good wit from the words or thoughts which would have served in the insult; that is, pleasure can be set free from other sources without being hindered by the same suppression. But the second development of pleasure would have to be foregone if the insulting quality of the wit were not allowed to come out, and as the latter is allowed to come to the surface, it is connected with the new release of pleasure. Experience with tendency-wit shows that under such circumstances the suppressed tendency can become so strengthened by the aid of wit-pleasure as to overcome the otherwise stronger inhibition. One resorts to insults because wit is thereby made impossible. But the satisfaction thus obtained is not produced by wit alone; it is incomparably greater, in fact it is by so much greater than the pleasure of the wit, that we

must assume that the former suppressed tendency has succeeded in breaking through, perhaps without the need of an outlet. Under these circumstances tendency-wit causes the most prolific laughter.

Perhaps the investigation of the determinations of laughter will aid us in forming a clearer picture of the process of the aid of wit against suppression. But we see even now that the case of tendency-wit is a special case of the principle of aid. A possibility of the development of pleasure enters into a situation in which another pleasure possibility is so hindered that individually it would not result in pleasure. The result is a development of pleasure which is greater by far than the added possibility. The latter acted, as it were, as an *alluring premium;* with the aid of a small sum of pleasure a very large and almost inaccessible amount is obtained. I have good grounds for thinking that this principle corresponds to an arrangement which holds true in many widely separated spheres of the psychic life, and I consider it appropriate to designate the pleasure serving to liberate the large sum of pleasure as *fore-pleasure* and the principle as the *principle of fore-pleasure.*

Play-pleasure and Removal-pleasure

The effect of tendency-wit may now be formulated as follows: It enters the service of tendencies in order to produce new pleasure by removing suppressions and repressions. This it does, using wit-pleasure as fore-pleasure. When we now review its development we may say that wit has remained true to its nature from beginning to end. It begins as play in order to obtain pleasure from the free use of words and thoughts. As soon as the growing reason forbids this senseless play with words and thoughts, it turns to the jest or joke in order to hold to these sources of pleasure and in order to be able to gain new pleasure from the liberation of the absurd. In the rôle of harmless wit it assists the thoughts and fortifies them against the impugnment of the critical judgment, whereby it makes use of the principle of intermingling the pleasure-sources. Finally, it enters into the great struggling suppressed tendencies in order to remove inner inhibitions in accordance with the principle of fore-pleasure. Reason, critical judgment, and suppression, these are the forces which it combats in turn. It firmly holds on to the original word-pleasure sources, and beginning with the stage of the jest opens for itself new pleasure sources by removing inhibition. The pleasure which it produces, be it play-pleasure or removal-

pleasure, can at all times be traced to the economy of psychic expenditure, in so far as such a conception does not contradict the nature of pleasure, and proves itself productive also in other fields. [7]

ENDNOTES.

[1] If I may be permitted to anticipate what later is discussed in the text I can here throw some light upon the condition which seems to be authoritative in the usage of language when it is a question of calling a joke “good” or “poor.” If by means of a double meaning or slightly modified word I have gotten from one idea to another by a short route, and if this does not also simultaneously result in senseful association between the two ideas, then I have made a “poor” joke. In this poor joke one word or the “point” forms the only existing association between the two widely separated ideas. The joke “Home-Roulard” used above is such an example. But a “good” joke results if the infantile expectation is right in the end and if with the similarity of the word another essential similarity in meaning is really simultaneously produced — as In the examples Traduttore — Traditore (translator — traitor), and Amantes — Amentes (lovers — lunatics). The two disparate ideas which are here linked by an outer association are held together besides by a senseful connection which expresses an important relationship between them. The outer association only replaces the inner connection; it serves to indicate the latter or to clarify it. Not only does “translator” sound somewhat similar to “traitor,” but he is a sort of a traitor whose claims to that name are good. The same may be said of Amantes — Amentes. Not only do the words bear a resemblance, but the similarity between “love” and “lunacy” has been noted from time immemorial.

The distinction made here agrees with the differentiation, to be made later, between a “witticism” and a “jest.” However, it would not be correct to exclude examples like Home-Roulard from the discussion of the nature of wit. As soon as we take into consideration the peculiar pleasure of wit, we discover that the “poor” witticisms are by no means poor as witticisms, i.e., they are by no means unsuited for the production of pleasure.

[7] The nonsense-witticisms, which have been somewhat slighted in this treatise, deserve a short supplementary comment.

In view of the significance attributed by our conception to the factor “sense in nonsense,” one might be tempted to demand that every witticism should be a nonsense-joke. But this is not

necessary, because only the play with thoughts inevitably leads to nonsense, whereas the other source of wit-pleasure, the play with words, makes this impression incidental and does not regularly invoke the criticism connected with it. The double root of wit-pleasure — from the play with words and thoughts, which corresponds to the most important division into word- and thought-witticisms — sets its face against a short formulation of general principles about wit as a tangible aggravation of difficulties. The play with words produces laughter, as is well known, in consequence of the factor of recognition described above, and therefore suffers suppression only in a small degree. The play with thoughts cannot be motivated through such pleasure: it has suffered a very energetic suppression and the pleasure which it can give is only the pleasure of released inhibitions. Accordingly one may say that wit-pleasure shows a kernel of the original play-pleasure and a shell of removal-pleasure. Naturally we do not grant that the pleasure in nonsense-wit is due to the fact that we have succeeded in making nonsense despite the suppression, while we do notice that the play with words gives us pleasure. Nonsense, which has remained fixed in thought wit, acquires secondarily the function of stimulating our attention through confusion, it serves as a reinforcement of the effect of wit, but only when it is insistent, so that the confusion can anticipate the intellect by a definite fraction of time. That nonsense in wit may also be employed to represent a judgment contained within the thought has been demonstrated by the example on p. 73. But even this is not the primal signification of nonsense in wit.

A series of wit-like productions for which we have no appropriate name, but which may lay claim to the designation of “witty nonsense,” may be added to the nonsense-jokes. They are very numerous, but I shall cite only two examples: As the fish was served to a guest at the table he put both hands twice into the mayonnaise and then ran them through his hair. Being looked at by his neighbor with astonishment he seemed to have noticed his mistake and excused himself, saying: “Pardon me, I thought it was spinach.”

Or: “Life is like a suspension bridge,” said the one. “How is that?” asked the other. “How should I know?” was the answer.

These extreme examples produce an effect through the fact that they give rise to the expectation of wit, so that one makes the effort to find the hidden sense behind the nonsense. But none is found, they are really nonsense. Under that deception it was possible for one moment to liberate the pleasure in nonsense. These witticisms are not altogether without tendencies, they furnish the narrator a certain pleasure in that they deceive and annoy the hearer. The latter then calms his anger by resolving that he himself should take the place of the narrator.

V. The Motives of Wit and Wit as a Social Process

IT seems superfluous to speak of the motives of wit, since the purpose of obtaining pleasure must be recognized as a sufficient motive of the wit-work. But on the one hand it is not impossible that still other motives participate in the production of wit, and on the other hand, in view of certain well-known experiences, the theme of the subjective determination of wit must be discussed.

Two things above all urge us to it. Though wit-making is an excellent means of obtaining pleasure from the psychic processes, we know that not all persons are equally able to make use of it. Wit-making is not at the disposal of all, in general there are but a few persons to whom one can point and say that they are witty. Here wit seems to be a special ability somewhere within the region of the old "psychic faculties," and this shows itself in its appearance as fairly independent of the other faculties such as intelligence, phantasy, memory, etc. A special talent or psychic determination permitting or favoring wit-making must be presupposed in all wit-makers.

I am afraid that we shall not get very far in the exploration of this theme. Only now and then do we succeed in proceeding from the understanding of a single witticism to the knowledge of the subjective determinations in the mind of the wit-maker. It is quite accidental that the example of wit with which we began our investigation of the wit-technique permits us also to gain some insight into the subjective determination of the witticism. I am referring to Heine's witticism, to which also Heymans and Lipps have paid attention.

"I was sitting next to Solomon Rothschild and he treated me just as an equal, quite famillionaire" ("Bäder von Lucca").

Subjective Determination of the "Famillionaire" Witticism

Heine put this word in the mouth of a comical person, Hirsch-Hyacinth, collector, operator and tax appraiser from Hamburg, and valet of the aristocratic baron, Cristoforo Gumpelino (formerly Gumpel). Evidently the poet has experienced great pleasure in these productions, for he allows Hirsch-Hyacinth to talk big and puts in his mouth the most amusing and most candid utterances; he positively endows him with the practical wisdom of a Sancho Panza. It is a pity that Heine, as it seems, had no

liking for this dramatic figure and that he drops the delightful character so soon. From many passages it would seem that the poet himself is speaking behind the transparent mask of Hirsch-Hyacinth, and we are quite convinced that this person is nothing but a parody of the poet himself. Hirsch tells of reasons why he has discarded his former name and now calls himself Hyacinth. “Besides I have the advantage,” he continues, “of having an H on my seal already, and therefore I am in no need of having a new letter engraved.” But Heine himself resorted to this economy when he changed his surname “Harry” to “Heinrich” at his baptism. Every one acquainted with the life of the poet will recall that in Hamburg, where one also meets the personage Hirsch-Hyacinth, Heine had an uncle of the same name, who played the greatest rôle in Heine’s life as the wealthy member of the family. The uncle’s name was likewise Solomon, just like the elderly Rothschild who treated the impecunious Hirsch on such a famillionaire basis. What seems to be merely a jest in the mouth of Hirsch-Hyacinth soon reveals a background of earnest bitterness when we attribute it to the nephew Harry-Heinrich. For he belonged to the family, nay, more, it was his earnest wish to marry a daughter of this uncle, but she refused him, and his uncle always treated him on a somewhat famillionaire basis, as a poor relative. His rich relatives in Hamburg always dealt with him condescendingly. I recall the story of one of his old aunts by marriage who, when she was still young and pretty, sat next to some one at a family dinner who seemed to her unprepossessing and whom the other members of the family treated shabbily. She did not feel herself called upon to be any more condescending towards him. Only many years later did she discover that the careless and neglected cousin was the poet Heinrich Heine. We know from many a record how keenly Heine suffered from these repulses at the hands of his wealthy relatives in his youth and during later years. The witticism “famillionaire” grew out of the soil of such a subjective emotional feeling.

One may suspect similar subjective determinations in many other witticisms of the great scoffers, but I know of no other example by which one can show this in such a convincing way. It is therefore hazardous to venture a more definite opinion about the nature of this personal determination. Furthermore, one is not inclined in the first place to claim similar complicated conditions for the origin of each and every witticism. Neither are the witty productions of other celebrated men better suited to

give us the desired insight into the subjective determination of wit. In fact, one gets the impression that the subjective determination of wit production is oftentimes not unrelated to persons suffering from neurotic diseases, when, for example, one learns that Lichtenberg was a confirmed hypochondriac burdened with all kinds of eccentricities. The great majority of witticisms, especially those produced from current happenings, are anonymous; one might be inquisitive to know what kind of people they are who originate them. The physician occasionally has an opportunity to make a study of persons who, if not renowned wits, are recognized in their circle as witty and as originators of many passable witticisms; he is often surprised to find such persons showing dissociated personalities and a predisposition to nervous affections. However, owing to insufficient data, we certainly cannot maintain that such a psychoneurotic constitution is a regular or necessary subjective condition for wit-making.

A clearer case is afforded by Jewish witticisms which, as before mentioned, are made exclusively by Jews themselves, whereas Jewish stories of different origin rarely rise above the level of the comical strain or of brutal mockery (p. 166). The determination for the self-participation here, as in Heine's joke "famillionaire," seems to be due to the fact that the person finds it difficult to express directly his criticism or aggression and is thus compelled to resort to by-ways.

Other subjective determinations or favorable conditions for wit-making are less shrouded in darkness. The motive for the production of harmless wit is usually the ambitious impulse to display one's spirit or to "show off." It is an impulse comparable to the impulse toward sexual exhibition. The existence of numerous inhibited impulses whose suppression retains some weakness produces a state favorable for the production of tendency-wit. Thus certain single components of the sexual constitution may appear as motives for wit-formation. A whole series of obscene witticisms lead one to the conclusion that a person who gives origin to such wit conceals a desire to exhibit. Persons having a powerful sadistical component in their sexuality, which is more or less inhibited in life, are most successful with the tendency-wit of aggression.

The Impulse to Impart Wit

The second fact which impels one to examine the subjective determination of wit is the common experience that nobody is satisfied with making wit for himself. Wit-making is inseparably connected with the desire to impart it; in fact this impulse is so strong that it is often realized after overcoming strong objections. In the comic, too, one experiences pleasure by imparting it to another person; but this is not imperative; one can enjoy the comic alone when one happens on it. Wit, on the other hand, must be imparted. Apparently the process of wit-formation does not end with the conception of wit. There remains something which strives to complete the mysterious process of wit-formation by imparting it.

We cannot conjecture, in the first place, what may have motivated the impulse to impart wit. But in wit we notice another peculiarity which again distinguishes it from the comic. If I encounter the latter I can laugh heartily over it alone; I am naturally pleased if by imparting it to some one else I make him laugh too. In the case of wit, however, which occurs to me or which I have made, I cannot laugh over it in spite of the unmistakable feeling of pleasure which I experience in the witticism. It is possible that my need to impart the witticism to another is in some way connected with the resultant laughter, which is manifest in the other, but denied to me.

But why do I not laugh over my own joke? And what rôle does the other person play in it?

Let us consider the last query first. In the comic usually two persons come into consideration. Besides my own ego there is another person in whom I find something comic; if objects appear comical to me, it takes place by means of a sort of personification which is not uncommon in our notional life. The comic process is satisfied with these two persons, the ego and the object person; there may also be a third person, but it is not obligatory. Wit as a play with one’s own words and thoughts at first dispenses with an object person, but already, upon the first step of the jest, it demands another person to whom it can impart its result, if it has succeeded in safeguarding play and nonsense against the remonstrance of reason. The second person in wit does not, however, correspond to the object person, but to the third person who is the other person in the comic. It seems that in the jest the decision as to whether wit has fulfilled its task is transferred to the other person, as if the ego were not quite certain of its opinion in the matter. The harmless wit is also in need of the other

person's support in order to ascertain whether it has accomplished its purpose. If wit enters the service of sexual or hostile tendencies, it can be described as a psychic process among three persons, just as in the comic, with the exception that there the third person plays a different rôle. The psychic process of wit is consummated here between the first person — the ego, and the third person — the stranger, and not, as in the comic, between the ego and the object person.

Also, in the case of the third person of wit, the wit is confronted with subjective determinations which can make the goal of the pleasure-stimulus unattainable. As Shakespeare says in *Love's Labor's Lost* (Act V, Scene 2):

"A jest's prosperity lies in the ear
Of him that hears it, never in the tongue
Of him that makes it."

He whose thoughts run in sober channels is incompetent to declare whether or not the jest is a good one. He himself must be in a jovial, or at least indifferent, state of mind in order to become the third person of the jest. The same hindrance is present in the case of both harmless and tendency wit; but in the latter the antagonism to the tendency which wishes to serve wit, appears as a new hindrance. The readiness to laugh about an excellent smutty joke cannot manifest itself if the exposure concerns an honored kinsman of the third person. In an assemblage of divines and pastors no one would dare to refer to Heine's comparison of Catholic and Protestant priests as retail dealers and employees of a wholesale business. In the presence of my opponent's friends the wittiest invectives with which I might assail him would not be considered witticisms but invectives, and in the minds of my hearers it would create not pleasure, but indignation. A certain amount of willingness or a certain indifference, the absence of all factors which might evoke strong feelings in opposition to the tendency, are absolute conditions for the participation of the third person in the completion of the wit process.

The Third Person of the Witticism

Wherever such hindrances to the operation of wit fail, we see the phenomenon which we are now investigating, namely, that the pleasure

which the wit has provided manifests itself more clearly in the third person than in the originator of the wit. We must be satisfied to use the expression “more clearly” where we should be inclined to ask whether the pleasure of the hearer is not more intensive than that of the wit producer, because we are obviously lacking the means of measuring and comparing it. We see, however, that the hearer shows his pleasure by means of explosive laughter after the first person, in most cases with a serious expression on his face, has related the joke. If I repeat a witticism which I have heard, I am forced, in order not to spoil its effect, to conduct myself during its recital exactly like him who made it. We may now put the question whether from this determination of laughter over wit we can draw conclusions concerning the psychic process of wit-formation.

Now it cannot be our intention to take into consideration everything that has been asserted and printed about the nature of laughter. We are deterred from this undertaking by the statement which Dugas, one of Ribot’s pupils, put at the beginning of his book *Psychologie du rire* (1902). “Il n’est pas de fait plus banal et plus étudié que le rire, il n’en est pas qui ait eu le don d’exciter davantage la curiosité du vulgaire et celle des philosophes, il n’ent est pas sur lequel on ait recueilli plus d’observations et bâti plus de théories, et avec cela il n’en est pas qui demeure plus inexpliqué, on serait tenté de dire avec les sceptiques qu’il faut être content de rire et de ne pas chercher à savoir pourquoi on rit, d’autant que peut-être le réflexion tue le rire, et qu’il serait alors contradictoire qu’elle en découvrit les causes” (page 1).

On the other hand, we must make sure to utilize for our purposes a view of the mechanism of laughter which fits our own realm of thought excellently. I refer to the attempted explanation of H. Spencer in his essay entitled *Physiology of Laughter.* [1]

According to Spencer laughter is a phenomenon of discharge of psychic irritation, and an evidence of the fact that the psychic utilization of this irritation has suddenly met with a hindrance. The psychological situation, which discharges itself in laughter, he describes in the following words: “Laughter naturally results only when consciousness is unawares transferred from great things to small — only when there is what we call a descending incongruity.” [2]

In an almost analogous sense the French authors (Dugas) designate laughter as a “détente,” a manifestation of release of tension, and A.

Bain's theory, "Laughter a relief from restraint," seems to me to approach Spencer's conceptions nearer than many authors would have us believe.

However, we experience the desire to modify Spencer's thought; to give a more definite meaning to some of the ideas and to change others. We would say that laughter arises when the sum total of psychic energy, formerly used for the occupation of certain psychic channels, has become unutilizable so that it can experience absolute discharge. We know what criticism such a declaration invites, but for our defense we dare cite a pertinent quotation from Lipps's treatise on *Komik und Humor,* an analysis which throws light on other problems besides the comic and humor. He says: "In the end individual psychological problems always lead us fairly deeply into psychology, so that fundamentally no psychological problem may be considered by itself" (p. 71). The terms "psychic energy," "discharge," and the treatment of psychic energy as a quantity have become habitual modes of thinking since I began to explain to myself the fact of psychopathology philosophically. Being of the same opinion as Lipps I have essayed to represent in my *Interpretation of Dreams* the unconscious psychic processes as real entities, and I have not represented the conscious contents as the "real psychic activity." [3] Only when I speak about the "investing energy (*Besetzung*) of psychic channels," do I seem to deviate from the analogies that Lipps uses. The knowledge that I have gained about the fact that psychic energy can be displaced from one idea to another along certain association channels, and about the almost indestructible conservation of the traces of psychic processes, have actually made it possible for me to attempt such a representation of the unknown. In order to obviate the possibility of a misunderstanding I must add that I am making no attempt to proclaim that cells and fibers, or the neuron system in vogue nowadays, represent these psychic paths, even if such paths would have to be represented by the organic elements of the nervous system in a manner which cannot yet be indicated.

Laughter as a Discharge

Thus, according to our assumption, the conditions for laughter are such that a sum of psychic energy hitherto employed in the occupation of some paths may experience free discharge. And since not all laughter, (but surely the laughter of wit), is a sign of pleasure, we shall be inclined to refer this pleasure to the release of previously existing static energy

(*Besetzungsenergie*). When we see that the hearer of the witticism laughs, while the creator of the same cannot, then that must indicate that in the hearer a sum of damming energy has been released and discharged, whereas during the wit formation, either in the release or in the discharge, inhibitions resulted. One can characterize the psychic process in the hearer, in the third person of the witticism, hardly more pointedly than by asserting that he has bought the pleasure of the witticism with very little expenditure on his part. One might say that it is presented to him. The words of the witticism which he hears necessarily produce in him that idea or thought-connection whose formation in him was also resisted by great inner hindrances. He would have had to make an effort of his own in order to bring it about spontaneously like the first person, or he would have had to put forth at least as much psychic expenditure as to equalize the force of the suppression or repression of the inhibition. This psychic expenditure he has saved himself; according to our former discussion (p. 80) we should say that his pleasure corresponds to this economy. Following our understanding of the mechanism of laughter we should be more likely to say that the static energy utilized in the inhibition has now suddenly become superfluous and neutralized because a forbidden idea came into existence on the way to auditory perception and is therefore ready to be discharged through laughter. Essentially both statements amount to the same thing, for the economized expenditure corresponds exactly to the now superfluous inhibition. The latter statement is more obvious, for it permits us to say that the hearer of the witticism laughs with the amount of psychic energy which was liberated by the suspension of inhibition energy; that is, he laughs away, as it were, this amount of psychic energy.

Why the First Person Does Not Laugh

If the person in whom the witticism is formed cannot laugh, then it indicates, as we have just remarked, that there is a deviation from the process in the case of the third person which concerns either the suspension of the inhibition energy or the discharge possibility of the same. But the first of the two cases is inconclusive, as we must presently see. The inhibition energy of the first person must have been dissipated, for otherwise there would have been no witticism, the formation of which had to overcome just such a resistance. Otherwise, too, it would have been impossible for the first person to experience the wit-pleasure which the

removal of the inhibition forced us to deduce. But there remains a second possibility, namely, that even though he experienced pleasure the first person cannot laugh, because the possibility of discharge has been disturbed. In the production of laughter such discharge is essential; an interruption in the possibility of discharge might result from the attachment of the freed occupation energy to some immediate endopsychic possibility. It is well that we have become cognizant of this possibility; we shall soon pay more attention to it. But with the wit-maker still another condition leading to the same result is possible. Perhaps, after all, no appreciable amount of energy has been liberated, in spite of the successful release of occupation energy. In the first person of the witticism wit-work actually takes place which must correspond to a certain amount of fresh psychic expenditure. Thus the first person contributes the power which removes the inhibitions and which surely results in a gain of pleasure for himself; in the case of tendency-wit it is indeed a very big gain, since the fore-pleasure gained from the wit-work takes upon itself the further removal of inhibitions. But the expenditure of the wit-work is, in every case, derived from the gain which is the result of the removal of inhibitions; it is the same expenditure which escapes from the hearer of the witticism. To confirm what was said above it may be added that the witticism loses its laughter effect in the third person as soon as an expenditure of mental work is exacted of him. The allusions of the witticism must be striking, and the omissions easily supplemented; with the awakening of conscious interest in thinking, the effect of the witticism is regularly made impossible. Here lies the real distinction between the witticism and the riddle. It may be that the psychic constellations during wit-work are not at all favorable to the free discharge of the energy gained. We are not here in a position to gain a deeper understanding; our inquiry as to why the third person laughs we have been able to clear up better than the question why the first person does not laugh.

At any rate, if we have well in mind these views about the conditions of laughter and about the psychic process in the third person, we have arrived at a place where we can satisfactorily elucidate an entire series of peculiarities which are familiar in wit, but which have not been understood. Before an amount of interlocked energy, capable of discharge, is to be liberated in the third person, there are several conditions which must be fulfilled or which at least are desirable. 1. It must be definitely

established that the third person really produces this expenditure of energy. 2. Care must be taken that when the latter becomes freed that it should find another psychic use instead of offering itself to the motor discharge. 3. It can be of advantage only if the energy to be liberated in the third person is first strengthened and heightened. Certain processes of wit-work which we can gather together under the caption of secondary or auxiliary techniques serve all these purposes.

The first of these conditions determines one of the qualifications of the third person as hearer of the witticism. He must throughout be so completely in psychic harmony with the first person that he makes use of the same inner inhibitions which the wit-work has overcome in the first person. Whoever is focused on smutty jokes will not be able to derive pleasure from clever exhibitionistic wit. Mr. N.'s aggressions will not be understood by uncultured people who are wont to give free rein to their pleasure gained by insulting others. Every witticism thus demands its own public, and to laugh over the same witticisms is a proof of absolute psychic agreement. We have indeed arrived at a point where we are at liberty to examine even more thoroughly the process in the third person's mind. The latter must be able habitually to produce the same inhibition which the joke has surmounted in the first person, so that, as soon as he hears the joke, there awakens within him compulsively and automatically a readiness for this inhibition. This readiness for the inhibition, which I must conceive as a true expenditure analogous to the mobilization of an army, is simultaneously recognized as superfluous or as belated, and is thus immediately discharged in its nascent state through the channel of laughter. [4]

The second condition for the production of the free discharge, a cutting off of any other outlets for the liberated energy, seems to me of far greater importance. It furnishes the theoretical explanation for the uncertainty of the effect of wit; if the thoughts expressed in the witticism evoke very exciting ideas in the hearer, (depending on the agreement or antagonism between the wit's tendencies and the train of thought dominating the hearer), the witty process either receives or is refused attention. Of still greater theoretical interest, however, are a series of auxiliary wit-techniques which obviously serve the purpose of diverting the attention of the listeners from the wit-process so as to allow the latter to proceed automatically. I advisedly use the term "automatically" rather than

“unconsciously” because the latter designation might prove misleading. It is only a question of keeping the psychic process from getting more than its share of attention during the recital of the witticism, and the usefulness of these auxiliary techniques permits us to assume rightfully that it is just the occupation of attention which has a large share in the control and in the fresh utilization of the freed energy of occupation.

The Automatism of the Wit-process

It seems to be by no means easy to avoid the endopsychic utilization of energy that has become superfluous, for in our mental processes we are constantly in the habit of transferring such emotional outputs from one path to another without losing any of their energy through discharge. Wit prevents this in the following way. In the first place it strives for the shortest possible expression in order to expose less points of attack to the attention. Secondly, it strictly adheres to the condition that it be easily understood (*v. s.*), for as soon as it has recourse to mental effort or demands a choice between different mental paths, it imperils the effect not only through the unavoidable mental expenditure, but also through the awakening of attention. Besides this, wit also makes use of the artifice of diverting the attention by offering to it something in the expression of the witticism which fascinates it so that meanwhile the liberation of inhibition energy and its discharge can take place undisturbed. The omissions in the wording of wit already carry out this intention. They impel us to fill in the gaps and in this way they keep the wit-process free from attention. The technique of the riddle, as it were, which attracts attention is here pressed into the service of the wit-work. The façade formations, which we have already discovered in many groups of tendency-wit, are still more effective (see p. 155). The syllogistical façades excellently fulfill the purpose of riveting the attention by an allotted task. While we begin to ponder wherein the given answer was lacking already we are laughing; our attention has been surprised, and the discharge of the liberated emotional inhibition has been effected. The same is true of witticisms possessing a comic façade in which the comic serves to assist the wit-technique. A comic façade promotes the effect of wit in more than one way; it makes possible not only the automatism of the wit-process by riveting the attention, but also it facilitates the discharge of wit by sending ahead a discharge from the comic. Here the effect of the comic resembles that of a

fascinating fore-pleasure, and we can thus understand that many witticisms are able to dispense entirely the fore-pleasures produced by other means of wit, and make use of only the comic as a fore-pleasure. Among the true techniques of wit it is especially displacement and representation through absurdity which, besides other properties, also develop the deviation of attention so desirable for the automatic discharge of the wit-process. [5]

We already surmise, and later will be able to see more clearly, that in this condition of deviation of attention we have disclosed no unessential characteristic of the psychic process in the hearer of wit. In conjunction with this, we can understand something more. First, how it happens that we rarely ever know in a joke why we are laughing, although by analytical investigation we can determine the cause. This laughing is the result of an automatic process which was first made possible by keeping our conscious attention at a distance. Secondly, we arrive at an understanding of that characteristic of wit as a result of which wit can exert its full effect on the hearer only when it is new and when it comes to him as a surprise. This property of wit, which causes wit to be short-lived and forever urges the production of new wit, is evidently due to the fact that it is inherent in the surprising or the unexpected to succeed but once. When we repeat wit the awakened memory leads the attention to the first hearing. This also explains the desire to impart wit to others who have not heard it before, for the impression made by wit on the new hearer replenishes that part of the pleasure which has been lost by the lack of novelty. And an analogous motive probably urges the wit producer to impart his wit to others.

Elements Favoring the Wit-process

As elements favoring the wit-process, even if we can no longer consider them essentials, I present in the third place three technical aids to wit-work which are destined to increase the sums of energy to be discharged and thus enhance the effect of the wit. These technical aids also very often accentuate the attention directed to the wit, but they neutralize its influence by simultaneously fascinating it and impeding its movements. Everything that provokes interest and confusion exerts its influence in these two directions. This is especially true of the nonsense and contrast elements, and above all the “contrast of ideas,” which some authors consider the essential character of wit, but in which I see only a means to

reinforce the effect of wit. All that is confusing evokes in the hearer that condition of distribution of energy which Lipps has designated as “psychic damming”; and, doubtless, he has a right to assume that the force of the “discharge” varies with the success of the damming process which precedes it. Lipps’s exposition does not explicitly refer to wit, but to the comic in general, yet it seems quite probable that the discharge in wit, releasing a gush of inhibition energy, is brought to its height in a similar manner by means of the damming.

At length we are aware that the technique of wit is really determined by two kinds of tendencies, those which make possible the formation of wit in the first person, and those guaranteeing that the witticism produces in the third person as much pleasurable effect as possible. The Janus-like double-facedness of wit, which safeguards its original resultant pleasure against the impugnment of critical reason, belongs to the first tendency together with the mechanism of fore-pleasure; the other complications of technique produced by the conditions discussed in this chapter concern the third person of the witticism. Thus wit in itself is a double-tongued villain which serves two masters at the same time. Everything that aims toward gaining pleasure is calculated by the witticism to arouse the third person, as if inner, unsurmountable inhibitions in the first person were in the way of the same. Thus one gets the full impression of the absolute necessity of this third person for the completion of the wit-process. But while we have succeeded in obtaining a good insight concerning the nature of this process in the third person, we feel that the corresponding process in the first person is still shrouded in darkness. So far we have not succeeded in answering the first of our two questions: Why can we not laugh over wit made by ourselves? and: Why are we urged to impart our own witticisms to others? We can only suspect that there is an intimate connection between the two facts yet to be explained, and that we must impart our witticisms to others for the reason that we ourselves are unable to laugh over them. From our examinations of the conditions in the third person for pleasure gaining and pleasure discharging we can draw the conclusion that in the first person the conditions for discharge are lacking and that those for gaining pleasure are only incompletely fulfilled. Thus it is not to be disputed that we enhance our pleasure in that we attain the — to us impossible — laughter in this roundabout way from the impression of the person who was stimulated to laughter. Thus we laugh, so to speak, *par*

ricochet, as Dugas expresses it. Laughter belongs to those manifestations of psychic states which are highly infectious; if I make some one else laugh by imparting my wit to him, I am really using him as a tool in order to arouse my own laughter. One can really notice that the person who at first recites the witticism with a serious mien later joins the hearer with a moderate amount of laughter. Imparting my witticisms to others may thus serve several purposes. First, it serves to give me the objective certainty of the success of the wit-work; secondly, it serves to enhance my own pleasure through the reaction of the hearer upon myself; thirdly, in the case of repeating a not original joke, it serves to remedy the loss of pleasure due to the lack of novelty.

Economy and Full Expenditure

At the end of these discussions about the psychic processes of wit, in so far as they are enacted between two persons, we can glance back to the factor of economy which impressed us as an important item in the psychological conception of wit since we offered the first explanation of wit-technique. Long ago we dismissed the nearest but also the simplest conception of this economy, where it was a matter of avoiding psychic expenditure in general by a maximum restriction in the use of words and by the production of associations of ideas. We had then already asserted that brevity and laconisms are not witty in themselves. The brevity of wit is a peculiar one; it has to be a “witty” brevity. The original pleasure gain produced by playing with words and thoughts resulted, to be sure, from simple economy in expenditure, but with the development of play into wit the tendency to economize also had to shift its goals, for whatever might be saved by the use of the same words or by avoiding new thought connections would surely be of no account when compared to the colossal expenditure of our mental activity. We may be permitted to make a comparison between the psychic economy and a business enterprise. So long as the latter’s transactions are very small, good policy demands that expenses be kept low and that the costs of operation be minimized as much as possible. The economy still follows the absolute height of the expenditure. Later on when the volume of business has increased, the importance of the business expenses dwindles; increases in the expenditure totals matter little so long as the transactions and returns can be sufficiently increased. Keeping down running expenses would be

parsimonious; in fact, it would mean a direct loss. Nevertheless it would be equally false to assume that with a very great expenditure there would be no more room for saving. The manager inclined to economize would now make an effort to save on particular things and would feel satisfied if the same establishment, with its costly upkeep, could reduce its expenses at all, no matter how small the saving would seem in comparison to the entire expenditure. In quite an analogous manner the detailed economy in our complicated psychic affairs remains a source of pleasure, as may be shown by everyday occurrences. Whoever used to have a gas lamp in his room, but now uses electric light, will experience for a long time a definite feeling of pleasure when he presses the electric light button; this pleasure continues as long as at that moment he remembers the complicated arrangements necessary to light the gas lamp. Similarly the economy of expenditure in psychic inhibition brought about by wit — small though it may be in comparison to the sum total of psychic expenditure — will remain a source of pleasure for us, because we thereby save a particular expenditure which we were wont to make and which as before we were ready to make. That the expenditure is expected and prepared for is a factor which stands unmistakably in the foreground.

A localized economy, as the one just considered, will not fail to give us momentary pleasure, but it will not bring about a lasting alleviation so long as what has been saved here can be utilized in another place. Only when this disposal into a different path can be avoided, will the special economy be transformed into a general alleviation of the psychic expenditures. Thus, with clearer insight into the psychic processes of wit, we see that the factor of alleviation takes the place of economy. Obviously the former gives us the greater feeling of pleasure. The process in the first person of the witticism produces pleasure by removing inhibitions and by diminishing local expenditure; it does not, however, seem to come to rest until it succeeds through the intervention of the third person in attaining general relief through discharge.

ENDNOTES.

[1] H. Spencer, *The Physiology of Laughter* (first published in *Macmillan's Magazine* for March, 1860), Essays, Vol. 11, 1901.

[2] Different points in this declaration would demand an exhaustive inquiry into an investigation of the pleasure of the comic, a thing that other authors have already done, and which, at all events, does not touch our discussion. It seems to me that Spencer was not happy in his explanation of why the discharge happens to find just that path, the excitement of which results in the physical picture of laughter. I should like to add one single contribution to the subject of the physiological explanation of laughter, that is, to the derivation or interpretation of the muscular actions that characterize laughter — a subject that has been often treated before and since Darwin, but which has never been conclusively settled. According to the best of my knowledge the grimaces and contortions of the corners of the mouth that characterize laughter appear first in the satisfied and satiated nursling when he drowsily quits the breasts. There it is a correct motion of expression since it bespeaks the determination to take no more nourishment, an "enough," so to speak, or rather a "more than enough." This primal sense of pleasurable satiation may have furnished the smile, which ever remains the basic phenomenon of laughter, the later connection with the pleasurable processes of discharge.

[3] Cf. *The Interpretation of Dreams,* Chap. VII, also *On the Psychic Force,* etc., in the above cited book of Lipps (p. 123), where he says: "This is the general principle: The dominant factors of the psychic life are not represented by the contents of consciousness but by those psychic processes which are unconscious. The task of psychology, provided it does not limit itself to a mere description of the content of consciousness, must also consist of revealing the nature of these unconscious processes from the nature of the contents of consciousness and its temporal relationship. Psychology must itself be a theory of these processes. But such a psychology will soon find that there exist quite a number of characteristics of these processes which are unrepresented in the corresponding contents of consciousness.

[4] Heymans (*Zeitschrift für Psychol.,* XI) has taken up the viewpoint of the nascent state in a somewhat different connection.

[5] Through an example of displacement-wit I desire to discuss another interesting character of the technique of wit. The genial actress Gallmeyer when once asked how old she was is said to have answered this unwelcome question with abashed and downcast eyes, by saying, "In Brünn." This is a very good example of displacement. Having been asked her age, she replied by naming the place of her birth, thus anticipating the next query, and in this manner she wishes to imply: "This is a question which I prefer to pass by." And still we feel that the character of the witticism does not here come to expression undimmed. The deviation from the question is too obvious; the displacement is much too conspicuous. Our attention understands immediately that it is a matter of an intentional displacement. In other displacement-witticisms the displacement is disguised and our attention is riveted by the effort to discover it. In one of the displacement-witticisms (p. 69) the reply to the recommendation of the horse— "What in the world should I do in Monticello at 6:30 in the morning?" — the displacement is also an obtrusive one, but as a substitute for it it acts upon the attention in a senseless and confusing manner, whereas in the interrogation of the actress we know immediately how to dispose of her displacement answer.

The so-called "facetious questions" which may make use of the best techniques deviate from wit in other ways. An example of the facetious question with displacement is the following: "What is a cannibal who devours his father and mother? — Answer: An orphan. — And when he has devoured all his other relatives? — Sole-heir. — And where can such a monster ever find sympathy? — In the dictionary under S." The facetious questions are not full witticisms because the required witty answers cannot be guessed like the allusions, omissions, etc., of wit.

C. Theories of Wit

VI. The Relation of Wit to Dreams and to the Unconscious

AT the end of the chapter which dealt with the elucidation of the technique of wit (p. 125) we asserted that the processes of condensation with and without substitutive formation, displacement, representation through absurdity, representation through the opposite, indirect representation, etc., all of which we found participated in the formation of wit, evinced a far-reaching agreement with the processes of "dream-work." We promised, at that time, first to examine more carefully these similarities, and secondly, so far as such indications point to search for what is common to both wit and dreams. The discussion of this comparison would be much easier for us if we could assume that one of the subjects to be compared — the "dream-work" — were well known. But we shall probably do better not to take this assumption for granted. I received the impression that my book *The Interpretation of Dreams* created more "confusion" than "enlightenment" among my colleagues, and I know that the wider reading circles have contented themselves to reduce the contents of the book to a catchword, "Wish fulfillment" — a term easily remembered and easily abused.

However, in my continued occupation with the problems considered therein, for the study of which my practice as a psychotherapeutist affords me much opportunity, I found nothing that would impel me to change or improve on my ideas; I can therefore peacefully wait until the reader's comprehension has risen to my level, or until an intelligent critic has pointed out to me the basic faults in my conception. For the purposes of comparison with wit, I shall briefly review the most important features of dreams and dream-work.

We know dreams by the recollection which usually seems fragmentary and which occurs upon awakening. It is then a structure made up mostly of visual or other sensory impressions, which represents to us a deceptive picture of an experience, and may be mingled with mental processes (the "knowledge" in the dream) and emotional manifestations. What we thus remember as a dream I call "the manifest dream-content." The latter is often altogether absurd and confused, at other times it is merely one part or another that is so affected. But even if it be entirely coherent, as in the case of some anxiety dreams, it stands out in our psychic life as something

strange, for the origin of which one cannot account. Until recently the explanation for these peculiarities of the dream has been sought in the dream itself in that it was considered roughly speaking an indication of a muddled, dissociated, and "sleepy" activity of the nervous elements.

As opposed to this view I have shown that the excessively peculiar "manifest" dream-content can regularly be made comprehensible, and that it is a disfigured and changed transcription of certain correct psychic formations which deserve the name of "latent dream-thoughts." One gains an understanding of the latter by resolving the manifest dream-content into its component parts without regard for its apparent meaning, and then by following up the threads of associations which emanate from each one of the now isolated elements. These become interwoven and in the end lead to a structure of thoughts, which is not only entirely accurate, but also fits easily into the familiar associations of our psychic processes. During this "analysis" the dream-content loses all of the peculiarities so strange to us; but if the analysis is to be successful, we must firmly cast aside the critical objections which incessantly arise against the reproduction of the individual associations.

The Dream-work

From the comparison of the remembered manifest dream-content with the latent dream-thoughts thus discovered there arises the conception of "dream-work." The entire sum of the transforming processes which have changed the latent dream-thought into the manifest dream is called the dream-work. The astonishment which formerly the dream evoked in us is now perceived to be due to the dream-work.

The function of the dream-work may be described in the following manner. A structure of thoughts, mostly very complicated, which has been built up during the day and not brought to settlement — a day remnant — clings firmly even during night to the energy which it had assumed — the underlying center of interest — and thus threatens to disturb sleep. This day remnant is transformed into a dream by the dream-work and in this way rendered harmless to sleep. But in order to make possible its employment by the dream-work, this day remnant must be capable of being cast into the form of a wish, a condition that is not difficult to fulfill. The wish emanating from the dream-thoughts forms the first step and later on the nucleus of the dream. Experience gained from analyses — not the

theory of the dream — teaches us that with children a fond wish left from the waking state suffices to evoke a dream, which is coherent and senseful, but almost always short, and easily recognizable as a "wish fulfillment." In the case of adults the universally valid condition for the dream-creating wish seems to be that the latter should appear foreign to conscious thinking, that is, it should be a repressed wish, or that it should supply consciousness with reinforcement from unknown sources. Without the assumption of the unconscious activity in the sense used above, I should be at a loss to develop further the theory of dreams and to explain the material gleaned from experience in dream-analyses. The action of this unconscious wish upon the logical conscious material of dream-thoughts now results in the dream. The latter is thereby drawn down into the unconscious, as it were, or to speak more precisely, it is exposed to a treatment which usually takes place at the level of unconscious mental activity, and which is characteristic of this mental level. Only from the results of the "dream-work" have we thus far learned to know the qualities of this unconscious mental activity and its differentiation from the "foreconscious" which is capable of consciousness.

The Unconscious

A novel and difficult theory that runs counter to our habitual modes of thinking can hardly gain in lucidity by a condensed exposition. I can therefore accomplish little more in this discussion than refer the reader to the detailed treatment of the unconscious in my *Interpretation of Dreams,* and also to Lipps's work, which I consider most important. I am aware that he who is under the spell of a good old philosophical training, or stands aloof from a so-called philosophical system, will oppose the assumption of the "unconscious psychic processes" in Lipps's sense and in mine and will desire to prove the impossibility of it preferably by means of definitions of the term psychic. But definitions are conventional and changeable. I have often found that persons who dispute the unconscious on the grounds of its absurdity or impossibility have not received their impressions from those sources from which I, at least, have found it necessary to draw, in order to become aware of its existence. These opponents had never witnessed the effect of a posthypnotic suggestion, and they were immensely surprised at the evidence I imparted to them gleaned from my analysis of unhypnotized neurotics. They had never gained the

conception of the unconscious as something which one does not really know, while cogent proofs force one to supplement this idea by saying that one understands by the unconscious something capable of consciousness, something concerning which one has not thought and which is not in the field of vision of consciousness. Nor had they attempted to convince themselves of the existence of such unconscious thoughts in their own psychic life by means of an analysis of one of their own dreams, and when I attempted this with them, they could perceive their own mental occurrences only with astonishment and confusion. I have also gotten the impression that these are essentially affective resistances which stand in the way of the acceptation of the "unconscious," and that they are based on the fact that no one is desirous of becoming acquainted with his unconscious, and it is most convenient to deny altogether its possibility.

Condensation and Displacement in the Dream-work

The dream-work, to which I return after this digression, subjects the thought material uttered in the optative mood to a very peculiar elaboration. First of all it proceeds from the optative to the indicative mood; it substitutes "it is" for "would it were!" This "it is" is destined to become part of an hallucinatory representation which I have called the "regression" of the dream-work. This regression represents the path from the mental images to the sensory perceptions of the same, or if one chooses to speak with reference to the still unfamiliar — not to be understood anatomically — topic of the psychic apparatus, it is the region of the thought-formation to the region of the sensory perception. Along this road which runs in an opposite direction to the course of development of psychic complications the dream-thoughts gain in clearness; a plastic situation finally results as a nucleus of the manifest "dream picture." In order to arrive at such a sensory representation the dream-thoughts have had to experience tangible changes in their expression. But while the thoughts are changed back into mental images they are subjected to still greater changes, some of which are easily conceivable as necessary, while others are surprising. As a necessary secondary result of the regression one understands that nearly all relationships within the thoughts which have organized the same are lost to the manifest dream. The dream-work takes over, as it were, only the raw material of the ideas for representation, and not the thought-relations which held each other in check; or at least it

reserves the freedom of leaving the latter out of the question. On the other hand, there is a certain part of the dream-work which cannot be traced to the regression or to the recasting into mental images; it is just that part which is significant to us for the analogy to wit-formation. The material of the dream-thoughts experiences an extraordinary compression or *condensation* during the dream-work. The starting-points of this condensation are those points which are common to two or more dream-thoughts because they naturally pertain to both or because they are inevitable consequences of the contents of two or more dream-thoughts, and since these points do not regularly suffice for a prolific condensation new artificial and fleeting common points come into existence, and for this purpose preferably words are used which combine different meanings in their sounds. The newly framed common points of condensation enter as representatives of the dream-thoughts into the manifest dream-content, so that an element of the dream corresponds to a point of junction or intersection of the dream-thoughts, and with regard to the latter it must in general be called "over-determined." The process of condensation is that part of the dream-work which is most easily recognizable; it suffices to compare the recorded wording of a dream with the written dream-thoughts gained by means of analysis, in order to get a good impression of the productiveness of dream condensation.

It is not easy to convince one's self of the second great change that takes place in the dream-thoughts through the agency of the dream-work. I refer to that process which I have called the dream *displacement.* It manifests itself by the fact that what occupies the center of the manifest dream and is endowed with vivid sensory intensity has occupied a peripheral and secondary position in the dream-thoughts, and *vice versa.* This process causes the dream to appear out of proportion when compared with the dream-thoughts, and it is because of this displacement that it seems strange and incomprehensible to the waking state. In order that such a displacement should occur it must be possible for the occupation energy to pass uninhibited from important to insignificant ideas, — a process which in normal conscious thinking can only give the impression of "faulty thinking."

Transformation into expressive activity, condensation, and displacement are the three great functions which we can ascribe to the dream-work. A fourth, to which too little attention was given in *The*

Interpretation of Dreams, does not come into consideration here for our purpose. In a consistent elucidation of the ideas dealing with the "topic of the psychic apparatus" and "regression," which alone can lend value to these working hypotheses, an effort would have to be made to determine at what stages of regression the various transformations of the dream-thoughts occur. As yet no serious effort has been made in this direction, but at least we can speak definitely about displacement when we say that it must arise in the thought material while the latter is in the level of the unconscious processes. One will probably have to think of condensation as a process that extends over the entire course up to the outposts of the perceptive region; but in general it suffices to assume that there is a simultaneous activity of all the forces which participate in the formation of dreams. In view of the reserve which one must naturally exercise in the treatment of such problems, and in consideration of the inability to discuss here the main objections to these problems, I should like to trust somewhat to the assertion that the process of the dream-work which prepares the dream is situated in the region of the unconscious. Roughly speaking, one can distinguish three general stages in the formation of the dream: first, the transference of the conscious day remnants into the unconscious, a transference in which the conditions of the sleeping state must co-operate; secondly, the actual dream-work in the unconscious; and thirdly, the regression of the elaborated dream material to the region of perception, whereby the dream becomes conscious.

The forces participating in the dream-formation may be recognized as the following: the wish to sleep; the sum of occupation energy which still clings to the day remnants after the depression brought about by the state of sleep; the psychic energy of the unconscious wish forming the dream; and the opposing force of the *"censor"* which exercises its authority in our waking state, and is not entirely abolished during sleep. The task of dream-formation is, above all, to overcome the inhibition of the censor, and it is just this task that is fulfilled by the displacement of the psychic energy within the material of the dream-thoughts.

The Formula for Wit-work

Now we recall what caused us to think of the dream while investigating wit. We found that the character and activity of wit were bound up in certain forms of expression and technical means, among which the various

forms of condensation, displacement, and indirect representation were the most conspicuous. But the processes which led to the same results — condensation, displacement, and indirect expression — we learned to know as peculiarities of dream-work. Does not this analogy almost force us to the conclusion that wit-work and dream-work must be identical at least in one essential point? I believe that the dream-work lies revealed before us in its most important characters, but in wit we find obscured just that portion of the psychic processes which we may compare with the dream-work, namely, the process of wit-formation in the first person. Shall we not yield to the temptation to construct this process according to the analogy of dream-formation? Some of the characteristics of dreams are so foreign to wit that that part of the dream-work corresponding to them cannot be carried over to the wit-formation. The regression of the stream of thought to perception certainly falls away as far as wit is concerned. However, the other two stages of dream-formation, the sinking of a foreconscious [1] thought into the unconscious, and the unconscious elaboration, would give us exactly the result which we might observe in wit if we assumed this process in wit-formation. Let us decide to assume that this is the proceeding of wit-formation in the case of the first person. *A foreconscious thought is left for a moment to unconscious elaboration and the results are forthwith grasped by the conscious perception.*

Before, however, we attempt to prove the details of this assertion we wish to consider an objection which may jeopardize our assumption. We start with the fact that the techniques of wit point to the same processes which become known to us as peculiarities of dream-work. Now it is an easy matter to say in opposition that we would not have described the techniques of wit as condensation, displacement, etc., nor would we have arrived at such a comprehensive agreement in the means of representation of wit and dreams, if our previous knowledge of dream-work had not influenced our conception of the technique of wit; so that at the bottom we find that wit confirms only those tentative theories which we brought to it from our study of dreams. Such a genesis of agreement would be no certain guarantee of its stability beyond our preconceived judgment. No other author has thought of considering condensation, displacement, and indirect expression as active factors of wit. This might be a possible objection, but nevertheless it would not be justified. It might just as well be said that in order to recognize the real agreement between dreams and

wit our ordinary knowledge must be augmented by a specialized knowledge of dream-work. However, the decision will really depend only upon the question whether the examining critic can prove that such a conception of the technique of wit in the individual examples is forced, and that other nearer and farther-reaching interpretations have been suppressed in favor of mine; or whether the critic will have to admit that the tentative theories derived from the study of dreams can be really confirmed through wit. My opinion is that we have nothing to fear from such a critic and that our processes of reduction have confidently pointed out in which forms of expression we must search for the techniques of wit. That we designated these techniques by names which previously anticipated the result of the agreement between the technique of wit and the dream-work was our just prerogative, and really nothing more than an easily justified simplification.

There is still another objection which would not be vital, but which could not be so completely refuted. One might think that the techniques of wit that fit in so well considering the ends we have in view deserve recognition, but that they do not represent all possible techniques of wit or even all those in use. Also that we have selected only the techniques of wit which were influenced by and would suit the pattern of the dream-work, whereas others ignored by us would have demonstrated that such an agreement was not common to all cases. I really do not trust myself to make the assertion that I have succeeded in explaining all the current witticisms with reference to their techniques, and I therefore admit the possibility that my enumeration of wit-techniques may show many gaps. But I have not purposely excluded from my discussion any form of technique that was clear to me, and I can affirm that the most frequent, the most essential, and the most characteristic technical means of wit have not eluded my attention.

Wit as an Inspiration

Wit possesses still another character which entirely corresponds to our conception of the wit-work as originally discovered in our study of dreams. It is true that it is common to hear one say “I *made* a joke,” but one feels that one behaves differently during this process than when one pronounces a judgment or offers an objection. Wit shows in a most pronounced manner the character of an involuntary “inspiration” or a

sudden flash of thought. A moment before one cannot tell what kind of joke one is going to make, though it lacks only the words to clothe it. One usually experiences something indefinable which I should like most to compare to an absence, or sudden drop of intellectual tension; then all of a sudden the witticism appears, usually simultaneously with its verbal investment. Some of the means of wit are also utilized in the expression of thought along other lines, as in the cases of comparison and allusion. I can purposely will to make an allusion. In doing this I have first in mind (in the inner hearing) the direct expression of my thought, but as I am inhibited from expressing the same through some objection from the situation in question, I almost resolve to substitute the direct expression by a form of indirect expression, and then I utter it in the form of an allusion. But the allusion that comes into existence in this manner having been formed under my continuous control is never witty, no matter how useful it may be. On the other hand, the witty allusion appears without my having been able to follow up these preparatory stages in my mind. I do not wish to attribute too much value to this procedure, it is scarcely decisive, but it does agree well with our assumption that in wit-formation a stream of thought is dropped for a moment and suddenly emerges from the unconscious as a witticism.

Witticisms also evince a peculiar behavior along the lines of association of ideas. Frequently they are not at the disposal of our memory when we look for them; on the other hand, they often appear unsolicited and at places in our train of thought where we cannot understand their presence. Again, these are only minor qualities, but none the less they point to their unconscious origin.

Let us now collect the properties of wit whose formation can be referred to the unconscious. Above all there is the peculiar brevity of wit which, though not an indispensable, is a marked and distinctive characteristic feature. When we first encountered it we were inclined to see in it an expression of a tendency to economize, but owing to very evident objections we ourselves depreciated the value of this conception. At present we look upon it more as a sign of the unconscious elaboration which the thought of wit has undergone. The process of condensation which corresponds to it in dreams we can correlate with no other factor than with the localization in the unconscious, and we must assume that the conditions for such condensations which are lacking in the foreconscious

are present in the unconscious mental process. [2] It is to be expected that in the process of condensation some of the elements subjected to it become lost, while others which take over their occupation energy are strengthened by the condensation or are built up too energetically. The brevity of wit, like the brevity of dreams, would thus be a necessary concomitant manifestation of the condensation which occurs in both cases; both times it is a result of the condensation process. The brevity of wit is indebted also to this origin for its peculiar character which though not further assignable produces a striking impression.

The Unconscious and the Infantile

We have defined above the one result of condensation — the manifold application of the same material, play upon words, and similarity of sound — as a localized economy, and have also referred the pleasure produced by harmless wit to that economy. At a later place we have found that the original purpose of wit consisted in producing this kind of pleasure from words, a process which was permitted to the individual during the stage of playing, but which became banked in during the course of intellectual development or by rational criticism. Now we have decided upon the assumption that such condensations as serve the technique of wit originate automatically and without any particular purpose during the process of thinking in the unconscious. Have we not here two different conceptions of the same fact which seem to be incompatible with each other? I do not think so. To be sure, there are two different conceptions, and they demand to be brought in unison, but they do not contradict each other. They are merely somewhat strange to each other, and as soon as we have established a relationship between them we shall probably gain in knowledge. That such condensations are sources of pleasure is in perfect accord with the supposition that they easily find in the unconscious the conditions necessary for their origin; on the other hand, we see the motivation for the sinking into the unconscious in the circumstance that the pleasure-bringing condensation necessary to wit easily results there. Two other factors also, which upon first examination seem entirely foreign to each other and which are brought together quite accidentally, will be recognized on deeper investigation as intimately connected, and perhaps may be found to be substantially the same. I am referring to the two assertions that on the one hand wit could form such pleasure-bringing condensations

during its development in the stage of playing, that is, during the infancy of reason; and, on the other hand, that it accomplishes the same function on higher levels by submerging the thought into the unconscious. For the infantile is the source of the unconscious. The unconscious mental processes are no others than those which are solely produced during infancy. The thought which sinks into the unconscious for the purpose of wit-formation only revisits there the old homestead of the former playing with words. The thought is put back for a moment into the infantile state in order to regain in this way childish pleasure-sources. If, indeed, one were not already acquainted with it from the investigation of the psychology of the neuroses, wit would surely impress one with the idea that the peculiar unconscious elaboration is nothing else but the infantile type of the mental process. Only it is by no means an easy matter to grasp, in the unconscious of the adult, this peculiar infantile manner of thinking, because it is usually corrected, so to say, *statu nascendi*. However, it is successfully grasped in a series of cases, and then we always laugh about the "childish stupidity." In fact every exposure of such an unconscious fact affects us in a "comical" manner. [3]

It is easier to comprehend the character of these unconscious mental processes in the utterances of patients suffering from various psychic disturbances. It is very probable that, following the assumption of old Griesinger, we would be in a position to understand the deliria of the insane and to turn them to good account as valuable information, if we would not make the demands of conscious thinking upon them, but instead treat them as we do dreams by means of our art of interpretation. [4] In the dream, too, we were able to show the "return of psychic life to the embryonal state." [5]

In discussing the processes of condensation we have entered so deeply into the signification of the analogy between wit and dreams that we can here be brief. As we know that displacements in dream-work point to the influence of the censor of conscious thought, we will consequently be inclined to assume that an inhibiting force also plays a part in the formation of wit when we find the process of displacement among the techniques of wit. We also know that this is commonly the case; the endeavor of wit to revive the old pleasure in nonsense or the old pleasure in word-play meets with resistance in every normal state, a resistance which is exerted by the protest of critical reason, and which must be

overcome in each individual case. But a radical distinction between wit and dreams is shown in the manner in which the wit-work solves this difficulty. In the dream-work the solution of this task is brought about regularly through displacements and through the choice of ideas which are remote enough from the objectionable ones to secure passage through the censor; the latter themselves are but offsprings of those whose psychic energy they have taken upon themselves through full transference. The displacements are therefore not lacking in any dream and are far more comprehensive; they not only comprise the deviations from the trend of thought but also all forms of indirect expression, the substitution for an important but offensive element of one seemingly indifferent and harmless to the censor which form very remote allusions to the first, they include substitution also occurring through symbols, comparisons, or trifles. It is not to be denied that parts of this indirect representation really originate in the foreconscious thoughts of the dream, — as, for example, symbolical representation and representation through comparisons — because otherwise the thought would not have reached the state of the foreconscious expression. Such indirect expressions and allusions, whose reference to the original thought is easily findable, are really permissible and customary means of expression even in our conscious thought. The dream-work, however, exaggerates the application of these means of indirect expression to an unlimited degree. Under the pressure of the censor any kind of association becomes good enough for substitution by allusion; the displacement from one element to any other is permitted. The substitution of the inner associations (similarity, causal connection, etc.) by the so-called outer associations (simultaneity, contiguity in space, assonance) is particularly conspicuous and characteristic of the dream-work.

The Difference between Dream-technique and Wit-technique

All these means of displacement also occur as techniques of wit, but when they do occur they usually restrict themselves to those limits prescribed for their use in conscious thought; in fact they may be lacking, even though wit must regularly solve a task of inhibition. One can comprehend this retirement of the process of displacement in wit-work when one remembers that wit usually has another technique at its disposal through which it defends itself against inhibitions. Indeed, we have

discovered nothing more characteristic of it than just this technique. For wit does not have recourse to compromises as does the dream, nor does it evade the inhibition; it insists upon retaining the play with words or nonsense unaltered, but thanks to the ambiguity of words and multiplicity of thought-relations, it restricts itself to the choice of cases in which this play or nonsense may appear at the same time admissible (jest) or senseful (wit). Nothing distinguishes wit from all other psychic formations better than this double-sidedness and this double-dealing; by emphasizing the "sense in nonsense," the authors have approached nearest the understanding of wit, at least from this angle.

Considering the unexceptional predominance of this peculiar technique in overcoming inhibitions in wit, one might find it superfluous that wit should make use of the displacement-technique even in a single case. But on the one hand certain kinds of this technique remain useful for wit as objects and sources of pleasure — as, for example, the real displacement (deviation of the trend of thought) which in fact shares in the nature of nonsense, — and on the other hand one must not forget that the highest stage of wit, tendency-wit, must frequently overcome two kinds of inhibitions which oppose both itself and its tendency (p. 147), and that allusion and displacements are qualified to facilitate this latter task.

The numerous and unrestricted application of indirect representation, of displacements, and especially of allusions in the dream-work, has a result which I mention not because of its own significance but because it became for me the subjective inducement to occupy myself with the problem of wit. If a dream analysis is imparted to one unfamiliar with the subject and unaccustomed to it, and the peculiar ways of allusions and displacements (objectionable to the waking thoughts but utilized by the dream-work) are explained, the hearer experiences an uncomfortable impression; he declares these interpretations to be "witty," but it seems obvious to him that these are not successful jokes but forced ones which run contrary to the rules of wit. This impression can be easily explained; it is due to the fact that the dream-work operates with the same means as wit, but in the application of the same the dream exceeds the bounds which wit restricts. We shall soon learn that in consequence of the rôle of the third person wit is bound by a certain condition which does not affect the dream.

Irony — Negativism

Among those techniques which are common to both wit and dreams representation through the opposite and the application of absurdity are especially interesting. The first belongs to the strongly effective means of wit as shown in the examples of "out-doing wit" (p. 98). The representation through the opposite, unlike most of the wit-techniques, is unable to withdraw itself from conscious attention. He who intentionally tries to make use of wit-work, as in the case of the "habitual wit," soon discovers that the easiest way to answer an assertion with a witticism is to concentrate one's mind on the opposite of this assertion and trust to the chance flash of thought to brush aside the feared objection to this opposite by means of a different interpretation. Maybe the representation through its opposite is indebted for such a preference to the fact that it forms the nucleus of another pleasurable mode of mental expression, for an understanding of which we do not have to consult the unconscious. I refer to *irony,* which is very similar to wit and is considered a sub-species of the comic. The essence of irony consists in imparting the very opposite of what one intended to express, but it precludes the anticipated contradiction by indicating through the inflections, concomitant gestures, and through slight changes in style — if it is done in writing — that the speaker himself means to convey the opposite of what he says. Irony is applicable only in cases where the other person is prepared to hear the reverse of the statement actually made, so that he cannot fail to be inclined to contradict. As a consequence of this condition ironic expressions are particularly subject to the danger of being misunderstood. To the person who uses it, it gives the advantage of readily avoiding the difficulties to which direct expressions, as, for example, invectives, are subject. In the hearer it produces comic pleasure, probably by causing him to make preparations for contradiction, which are immediately found to be unnecessary. Such a comparison of wit with a form of the comical that is closely allied to it might strengthen us in the assumption that the relation of wit to the unconscious is the peculiarity that also distinguishes it from the comical. [6]

In dream-work, representation through the opposite has a far more important part to play than in wit. The dream not only delights in representing a pair of opposites by means of one and the same composite image, but in addition it often changes an element from the dream-thoughts into its opposite, thus causing considerable difficulty in the work of interpretation. In the case of any element capable of having an opposite

it is impossible to tell whether it is to be taken negatively or positively in the dream-thoughts. [7]

I must emphasize that as yet this fact has by no means been understood. Nevertheless, it seems to give indications of an important characteristic of unconscious thinking which in all probability results in a process comparable to “judging.” Instead of setting aside judgments the unconscious forms “repressions.” The repression may correctly be described as a stage intermediate between the defense reflex and condemnation. [8]

The Unconscious as the Psychic Stage of the Wit-work

Nonsense, or absurdity, which occurs so often in dreams and which has made them the object of so much contempt, has never really come into being as the result of an accidental shuffling of conceptual elements, but may in every case be proven to have been purposely admitted by the dream-work. Nonsense and absurdity are intended to express embittered criticism and scornful contradiction within the dream-thoughts. Absurdity in the dream-content thus stands for the judgment: “It’s pure nonsense,” expressed in dream-thoughts. In my work on the Interpretation of Dreams, I have placed great emphasis on the demonstration of this fact because I thought that I could in this manner most strikingly controvert the error expressed by many that the dream is no psychic phenomenon at all — an error which bars the way to an understanding of the unconscious. Now we have learnt (in the analysis of certain tendency-witticisms on p. 73) that nonsense in wit is made to serve the same purposes of expression. We also know that a nonsensical façade of a witticism is peculiarly adapted to enhance the psychic expenditure in the hearer and hence also to increase the amount to be discharged through laughter. Moreover, we must not forget that nonsense in wit is an end in itself, since the purpose of reviving the old pleasure in nonsense is one of the motives of the wit-work. There are other ways to regain the feeling of nonsense in order to derive pleasure from it; caricature, exaggeration, parody, and travesty utilize the same and thus produce “comical nonsense.” If we subject these modes of expression to an analysis similar to the one used in studying wit, we shall find that there is no occasion in any of them for resorting to unconscious processes in our sense for the purpose of getting explanations. We are now also in a position to understand why the “witty” character may be added as an

embellishment to caricature, exaggeration, and parody; it is the manifold character of the performance upon the “psychic stage” [9] that makes this possible.

I am of the opinion that by transferring the wit-work into the system of the unconscious we have made a distinct gain, since it makes it possible for us to understand the fact that the various techniques to which wit admittedly adheres are on the other hand not its exclusive property. Many doubts, which have arisen in the beginning of our investigation of these techniques and which we were forced temporarily to leave, can now be conveniently cleared up. Hence we shall give due consideration to the doubt which expresses itself by asserting that the undeniable relation of wit to the unconscious is correct only for certain categories of tendency-wit, while we are ready to claim this relation for all forms and all the stages of development of wit. We may not shirk the duty of testing this objection.

We may assume that we deal with a sure case of wit-formation in the unconscious when it concerns witticisms that serve unconscious tendencies, or those strengthened by unconscious tendencies, as, for example, most “cynical” witticisms. For in such cases the unconscious tendency draws the foreconscious thought down into the unconscious in order to remodel it there; a process to which the study of the psychology of the neuroses has added many analogies with which we are acquainted. But in the case of tendency-wit of other varieties, namely, harmless wit and the jest, this power seems to fall away, and the relation of the wit to the unconscious is an open question.

But now let us consider the case of the witty expression of a thought that is not without value in itself and that comes to the surface in the course of the association of mental processes. In order that this thought may become a witticism, it is of course necessary that it make a choice among the possible forms of expression in order to find the exact form that will bring along the gain in word-pleasure. We know from self-observation that this choice is not made by conscious attention; but the selection will certainly be better if the occupation energy of the foreconscious thought is lowered to the unconscious. For in the unconscious, as we have learnt from the dream-work, the paths of association emanating from a word are treated on a par with associations from objects. The occupation energy from the unconscious presents by far

the more favorable conditions for the selection of the expression. Moreover, we may assume without going farther that the possible expression which contains the gain in word-pleasure exerts a lowering effect on the still fluctuating self-command of the foreconscious, similar to that exerted in the first case by the unconscious tendency. As an explanation for the simpler case of the jest we may imagine that an ever-watchful intention of attaining the gain in word-pleasure seizes the opportunity offered in the foreconscious of again drawing the investing energy down into the unconscious, according to the familiar scheme.

I earnestly wish that it were possible for me on the one hand to present one decisive point in my conception of wit more clearly, and on the other hand to fortify it with compelling arguments. But as a matter of fact it is not a question here of two failures, but of one and the same failure. I can give no clearer exposition because I have no further testimony on behalf of my conception. The latter has developed as the result of my study of the technique and of comparison with dream-work, and indeed from this one side only. I now find that the dream-work is altogether excellently adapted to the peculiarities of wit. This conception is now concluded; if the conclusion leads us not to a familiar province, but rather to one that is strange and novel to our modes of thought, the conclusion is called a "hypothesis," and the relation of the hypothesis to the material from which it is drawn is justly not accepted as "proof." The hypothesis is admitted as "proved" only if it can be reached by other ways and if it can be shown to be the junction point for other associations. But such proof, in view of the fact that our knowledge of unconscious processes has hardly begun, cannot be had. Realizing then that we are on soil still virgin, we shall be content to project from our viewpoint of observation one narrow slender plank into the unexplored region.

We shall not build a great structure on such a foundation as this. If we correlate the different stages of wit to the mental dispositions favorable to them we may say: The *jest* has its origin in the happy mood; what seems to be peculiar to it is an inclination to lower the psychic static energies (*Besetzungen*). The jest already makes use of all the characteristic techniques of wit and satisfies the fundamental conditions of the same through the choice of such an assortment of words or mental associations as will conform not only to the requirements for the production of pleasure, but also conform to the demands of the intelligent critic. We

shall conclude that the sinking of the mental energy to the unconscious stage, a process facilitated by the happy mood, has already taken place in the case of the jest. The mood does away with this requirement in the case of *harmless* wit connected with the expression of a valuable thought; here we must assume a particular *personal adaptation* which finds it as easy to come to expression as it is for the foreconscious thought to sink for a moment into the unconscious. An ever watchful tendency to renew the original resultant pleasure of wit exerts thereby a lowering effect upon the still fluctuating foreconscious expression of the thought. Most people are probably capable of making jests when in a happy mood; aptitude for joking independent of the mood is found only in a few persons. Finally, the most powerful incentive for wit-work is the presence of strong tendencies which reach back into the unconscious and which indicate a particular fitness for witty productions; these tendencies might explain to us why the subjective conditions of wit are so frequently fulfilled in the case of neurotic persons. Even the most inapt person may become witty under the influence of strong tendencies.

Differences Between Wit and Dreams

This last contribution, the explanation of wit-work in the first person, though still hypothetical, strictly speaking, ends our interest in wit. There still remains a short comparison of wit to the more familiar dream and we may expect that, outside of the one agreement already considered, two such diverse mental activities should show nothing but differences. The most important difference lies in their social behavior. The dream is a perfectly asocial psychic product. It has nothing to tell to anyone else, having originated in an individual as a compromise between conflicting psychic forces it remains incomprehensible to the person himself and has therefore altogether no interest for anybody else. Not only does the dream find it unnecessary to place any value on intelligibleness, but it must even guard against being understood, as it would then be destroyed; it can only exist in disguised form. For this reason the dream may make use freely of the mechanism that controls unconscious thought processes to the extent of producing undecipherable disfigurements. Wit, on the other hand, is the most social of all those psychic functions whose aim is to gain pleasure. It often requires three persons, and the psychic process which it incites always requires the participation of at least one other person. It must

therefore bind itself to the condition of intelligibleness; it may employ disfigurement made practicable in the unconscious through condensation and displacement, to no greater extent than can be deciphered by the intelligence of the third person. As for the rest, wit and dreams have developed in altogether different spheres of the psychic life, and are to be classed under widely separated categories of the psychological system. No matter how concealed the dream is still a wish, while wit is a developed play. Despite its apparent unreality the dream retains its relation to the great interests of life; it seeks to supply what is lacking through a regressive detour of hallucinations; and it owes its existence solely to the strong need for sleep during the night. Wit, on the other hand, seeks to draw a small amount of pleasure from the free and unencumbered activities of our psychic apparatus, and later to seize this pleasure as an incidental gain. It thus *secondarily* reaches to important functions relative to the outer world. The dream serves preponderately to guard from pain while wit serves to acquire pleasure; in these two aims all our psychic activities meet.

ENDNOTES.

[1] Cf. *The Interpretation of Dreams,* Chapter VII.

[2] Besides the dream-work and the technique of wit I have been able to demonstrate condensation as a regular and significant process in another psychic occurrence, in the mechanism of normal (not purposive) forgetting. Singular impressions put difficulties in the way of forgetting; impressions in any way analogous are forgotten by becoming fused at their points of contact. The confusion of analogous impressions is one of the first steps in forgetting.

[3] Many of my patients while under psychoanalytic treatment are wont to prove regularly by their laughter that I have succeeded in demonstrating faithfully to their conscious perception the veiled unconscious; they laugh also when the content of what is disclosed does not at all justify this laughter. To be sure, it is conditional that they have approached this unconscious closely enough to grasp it when the physician has conjectured it and presented it to them.

[4] In doing this we must not forget to reckon with the distortion brought about by the censor which is still active in the psychoses.

[8] This very remarkable and still inadequately understood behavior of antagonistic relationships is probably not without value for the understanding of the symptom of negativism in neurotics and in the insane. Cf. the two latest works on the subject: Bleuler, “Über die negative Suggestibilität,” *Psych.-Neurol. Wochenschrift,* 1904, and Otto Groos’s *Zur Differential diagnostik negativistischer Phänomene,* also my review of the *Gegensinn der Urworte,* in *Jahrb. f. Psychonalyse* II, 1910.

[9] An expression of G. T. Fechner’s which has acquired significance from the point of view of my conception.

VII. Wit and the Various Forms of the Comic

WE have approached the problems of the comic in an unusual manner. It appeared to us that wit, which is usually regarded as a subspecies of the comic, offered enough peculiarities to warrant our taking it directly under consideration, and thus it came about that we avoided discussing its relation to the more comprehensive category of the comic as long as it was possible to do so, yet we did not proceed without picking up on the way some hints that might be valuable for studying the comic. We found it easy to ascertain that the comic differs from wit in its social behavior. The comic can be content with only two persons, one who finds the comical, and one in whom it is found. The third person to whom the comical may be imparted reinforces the comic process, but adds nothing new to it. In wit, however, this third person is indispensable for the completion of the pleasure-bearing process, while the second person may be omitted, especially when it is not a question of aggressive wit with a tendency. Wit is made, while the comical is found; it is found first of all in persons, and only later by transference may be seen also in objects, situations, and the like. We know, too, in the case of wit that it is not strange persons, but one’s own mental processes that contain the sources for the production of pleasure. In addition we have heard that wit occasionally reopens inaccessible sources of the comic, and that the comic often serves wit as a façade to replace the fore-pleasure usually produced by the well-known technique (p. 236). All of this does not really point to a very simple relationship between wit and the comic. On the other hand, the problems of the comic have shown themselves to be so complicated, and have until now so successfully defied all attempts made by the philosophers to solve them, that we have not been able to justify the expectation of mastering it by a sudden stroke, so to speak, even if we approach it along the paths of wit. Incidentally we came provided with an instrument for investigating wit that had not yet been made use of by others; namely, the knowledge of dream-work. We have no similar advantage at our disposal for comprehending the comic, and we may therefore expect that we shall learn nothing about the nature of the comic other than that which we have already become aware of in wit; in so far as wit belongs to the comic and retains certain features of the same unchanged or modified in its own nature.

The Naïve

The species of the comic that is most closely allied to wit is the *naïve.* Like the comic the naïve is found universally and is not made like in the case of wit. The naïve cannot be made at all, while in the case of the pure comic the question of making or evoking the comical may be taken into account. The naïve must result without our intervention from the speech and actions of other persons who take the place of the *second* person in the comic or in wit. The naïve originates when one puts himself completely outside of inhibition, because it does not exist for him; that is, if he seems to overcome it without any effort. What conditions the function of the naïve is the fact that we are aware that the person does not possess this inhibition, otherwise we should not call it naïve but impudent, and instead of laughing we should be indignant. The effect of the naïve, which is irresistible, seems easy to understand. An expenditure of that inhibition energy which is commonly already formed in us suddenly becomes inapplicable when we hear the naïve and is discharged through laughter; as the removal of the inhibition is direct, and not the result of an incited operation, there is no need for a suspension of attention. We behave like the hearer in wit, to whom the economy of inhibition is given without any effort on his part.

In view of the understanding about the genesis of inhibitions which we obtained while tracing the development of play into wit, it will not surprise us to learn that the naïve is mostly found in children, although it may also be observed in uneducated adults, whom we look on as children as far as their intellectual development is concerned. For the purposes of comparison with wit, naïve speech is naturally better adapted than naïve actions, for speech and not actions are the usual forms of expression employed by wit. It is significant, however, that naïve speeches, such as those of children, can without straining also be designated as "naïve witticisms." The points of agreement as well as demonstration between wit and naïveté will become clear to us upon consideration of a few examples. [1]

A little girl of three years was accustomed to hear from her German nurse the exclamatory word "Gesundheit" (*God bless you!; literally, may you be healthy!*) *whenever she happened to sneeze. While suffering from a severe cold during which the profuse coughing and sneezing caused her*

considerable pain, she pointed to her chest and said to her father, "Daddy, Gesundheit hurts."

Another little girl of four years heard her parents refer to a Jewish acquaintance as a Hebrew, and on later hearing the latter's wife referred to as Mrs. X, she corrected her mother, saying, "No, that is not her name; if her husband is a Hebrew she is a Shebrew."

In the first example the wit is produced through the use of a contiguous association in the form of an abstract thought for the concrete action. The child so often heard the word "Gesundheit" associated with sneezing that she took it for the act itself. While the second example may be designated as word-wit formed by the technique of sound similarity. The child divided the word Hebrew into He-brew and having been taught the genders of the personal pronouns, she naturally imagined that if the man is a He-brew his wife must be a She-brew. Both examples could have originated as real witticisms upon which we would have unwillingly bestowed a little mild laughter. But as examples of naïveté they seem excellent and cause loud laughter. But what is it here that produces the difference between wit and naïveté? Apparently it is neither the wording nor the technique, which is the same for both wit and the naïve, but a factor which at first sight seems remote from both. It is simply a question whether we assume that the speakers had the intention of making a witticism or whether we assume that they — the children — wished to draw an earnest conclusion, a conclusion held in good faith though based on uncorrected knowledge. Only the latter case is one of naïveté. It is here that our attention is first called to the mechanism in which the second person places himself into the psychic process of the person who produces the wit.

The investigation of a third example will confirm this opinion. A brother and a sister, the former ten and the latter twelve years old, produce a play of their own composition before an audience of uncles and aunts. The scene represents a hut on the seashore. In the first act the two dramatist-actors, a poor fisherman and his devoted wife, complain about the hard times and the difficulty of getting a livelihood. The man decides to sail over the wide ocean in his boat in order to seek wealth elsewhere, and after a touching farewell the curtain is drawn. The second act takes place several years later. The fisherman has come home rich with a big bag of money and tells his wife, whom he finds waiting in front of the hut, what good luck he has had in the far countries. His wife interrupts him

proudly, saying: “Nor have I been idle in the meanwhile,” and opens the hut, on whose floor the fisherman sees twelve large dolls representing children asleep. At this point of the drama the performers were interrupted by an outburst of laughter on the part of the audience, a thing which they could not understand. They stared dumfounded at their dear relatives, who had thus far behaved respectably and had listened attentively. The explanation of this laughter lies in the assumption on the part of the audience that the young dramatists know nothing as yet about the origin of children, and were therefore in a position to believe that a wife would actually boast of bearing offspring during the prolonged absence of her husband, and that the husband would rejoice with her over it. But the results achieved by the dramatists on the basis of this ignorance may be designated as nonsense or absurdity.

These examples show that the naïve occupies a position midway between wit and the comic. As far as wording and contents are concerned, the naïve speech is identical with wit; it produces a misuse of words, a bit of nonsense, or an obscenity. But the psychic process of the first person or producer which, in the case of wit, offered us so much that was interesting and puzzling, is here entirely absent. The naïve person imagines that he is using his thoughts and expressions in a simple and normal manner; he has no other purpose in view, and receives no pleasure from his naïve production. All the characteristics of the naïve lie in the conception of the hearer, who corresponds to the third person in the case of wit. The producing person creates the naïve without any effort. The complicated technique, which in wit serves to paralyze the inhibition produced by the critical reason, does not exist here, because the person does not possess this inhibition, and he can therefore readily produce the senseless and the obscene without any compromise. The naïve may be added to the realm of wit if it comes into existence after the important function of the censor, as observed in the formula for wit-formation, has been reduced to zero.

If the affective determination of wit consists in the fact that both persons should be subject to about the same inhibitions or inner resistances, we may say now that the determination of the naïve consists in the fact that one person should have inhibitions which the other lacks. It is the person provided with inhibitions who understands the naïve, and it is he alone who gains the pleasure produced by the naïve. We can easily understand that this pleasure is due to the removal of inhibitions. Since the

pleasure of wit is of the same origin — a kernel of word-pleasure and nonsense-pleasure, and a shell of removal- and release-pleasure, — the similarity of this connection to the inhibition thus determines the inner relationship between the naïve and wit. In both cases pleasure results from the removal of inner inhibitions. But the psychic process of the recipient person (which in the naïve regularly corresponds with our ego, whereas in wit we may also put ourselves in place of the producing person) is by as much more complicated in the case of the naïve as it is simpler in the producing person in wit. For one thing, the naïve must produce the same effect upon the receiving person as wit does, this may be fully confirmed by our examples, for just as in wit the removal of the censor has been made possible by the mere effort of hearing the naïve. But only a part of the pleasure created by the naïve admits of this explanation, in other cases of naïve utterances, even this portion would be endangered, as, for example, while listening to naïve obscenities. We would react to a naïve obscenity with the same indignation felt toward a real obscenity, were it not for the fact that another factor saves us from this indignation and at the same time furnishes the more important part of the pleasure derived from the naïve.

This other factor is the result of the condition mentioned before, namely, that in order to recognize the naïve we have to be cognizant of the fact that there are no inner inhibitions in the producing person. It is only when this is assured that we laugh instead of being indignant. Hence we take into consideration the psychic state of the producing person; we imagine ourselves in this same psychic state and endeavor to understand it by comparing it to our own. This putting ourselves into the psychic state of the producing person and comparing it with our own results in an economy of expenditure which we discharge through laughing.

We might prefer the simpler explanation, namely, that when we reflect that the person has no inhibition to overcome our indignation becomes superfluous; the laughing therefore results at the cost of economized indignation. In order to avoid this conception, which is, in general, misleading, I shall distinguish more sharply between two cases that I had treated as one in the above discussion. The naïve, as it appears to us, may either be in the nature of a witticism, as in our example, or an obscenity, or of anything generally objectionable; which becomes especially evident if the naïve is expressed not in speech but in action. This latter case is really

misleading; for it might lead one to assume that the pleasure originated from the economized and transformed indignation. The first case is the illuminating one. The naïve speech in the example “Hebrew” can produce the effect of a light witticism and give no cause for indignation; it is certainly the more rare, or the more pure and by far the more instructive case. In so far as we think that the child took the syllable “he” in “Hebrew” seriously, and without any additional reason identified it with the masculine personal pronoun, the increase in pleasure as a result of hearing it has no longer anything to do with the pleasure of the wit. We shall now consider what has been said from two viewpoints, first how it came into existence in the mind of the child, and secondly, how it would occur to us. In following this comparison we find that the child has discovered an identity and has overcome barriers which exist in us, and by continuing still further it may express itself as follows: “If you wish to understand what you have heard, you may save yourself the expenditure necessary for holding these barriers in place.” The expenditure which became freed by this comparison is the source of pleasure in the naïve, and is discharged through laughter; to be sure, it is the same expenditure which we would have converted into indignation if our understanding of the producing person, and in this case the nature of his utterance, had not precluded it. But if we take the case of the naïve joke as a model for the second case, viz., the objectionable naïve, we shall see that here, too, the economy in inhibition may originate directly from the comparison. That is, it is unnecessary for us to assume an incipient and then a strangulated indignation, an indignation corresponding to a different application of the freed expenditure, against which, in the case of wit, complicated defensive mechanisms were required.

Source of Comic Pleasure in the Naïve

This comparison and this economy of expenditure that occur as the result of putting one’s self into the psychic process of the producing person can have an important bearing on the naïve only if they do not belong to the naïve alone. As a matter of fact we suspect that this mechanism which is so completely foreign to wit is a part — perhaps the essential part — of the psychic process of the comic. This aspect — it is perhaps the most important aspect of the naïve — thus represents the naïve as a form of the comic. Whatever is added to the wit-pleasure by the

naïve speeches in our examples is “comical” pleasure. Concerning the latter we might be inclined to make a general assumption that this pleasure originates through an economized expenditure by comparing the utterance of some one else with our own. But since we are here in the presence of very broad views we shall first conclude our consideration of the naïve. The naïve would thus be a form of the comic, in so far as its pleasure originates from the difference in expenditure which results in our effort to understand the other person; and it resembles wit through the condition that the expenditure saved by the comparison must be an inhibition expenditure. [2]

Before concluding we shall rapidly point out a few agreements and differences between the conceptions at which we have just arrived and those that have been known for a long time in the psychology of the comic. The putting one’s self into the psychic process of another and the desire to understand him is obviously nothing else than the “comic burrowing” (*komisches Leihen*) which has played a part in the analysis of the comic ever since the time of Jean Paul; the “comparing” of the psychic process of another with our own corresponds to a “psychological contrast,” for which we here at last find a place, after we did not know what to do with it in wit. But in our explanation of comic pleasure we take issue with many authors who contend that this pleasure originates through the fluctuation of our attention to and fro between contrasting ideas. We are unable to see how such a mechanism could produce pleasure, and we point to the fact that in the comparing of contrasts there results a difference in expenditure which, if not used for anything else, becomes capable of discharge and hence a source of pleasure. [3]

It is with misgiving only that we approach the problem of the comic. It would be presumptuous to expect from our efforts any decisive contribution to the solution of this problem after the works of a large number of excellent thinkers have not resulted in an explanation that is in every respect satisfactory. As a matter of fact, we intend simply to follow out into the province of the comic certain observations that have been found valuable in the study of wit.

Occurrence and Origin of the Comic

The comical appears primarily as an unintentional discovery in the social relations of human beings. It is found in persons, that is, in their

movements, shapes, actions, and characteristic traits. In the beginning it is found probably only in their psychical peculiarities and later on in their mental qualities, especially in the expression of these latter. Even animals and inanimate objects become comical as the result of a widely used method of personification. However, the comical can be considered apart from the person in whom it is found, if the conditions under which a person becomes comical can be discerned. Thus arises the comical situation, and this knowledge enables us to make a person comical at will by putting him into situations in which the conditions necessary for the comic are bound up with his actions. The discovery that it is in our power to make another person comical opens the way to unsuspected gains in comic pleasure, and forms the foundation of a highly developed technique. It is also possible to make one's self just as comical as others. The means which serve to make a person comical are transference into comic situations, imitations, disguise, unmasking, caricature, parody travesty, and the like. It is quite evident that these techniques may enter into the service of hostile or aggressive tendencies. A person may be made comical in order to render him contemptible or in order to deprive him of his claims to dignity and authority. But even if such a purpose were regularly at the bottom of all attempts to make a person comical this need not necessarily be the meaning of the spontaneous comic.

As a result of this superficial survey of the manifestations of the comic we can readily see that the comic originates from wide-spread sources, and that conditions so specialized as those found in the naïve cannot be expected in the case of the comic. In order to get a clue to the conditions that are applicable to the comic the selection of the first example is most important. We will examine first the comic movement because we remember that the most primitive stage performance, the pantomime, uses this means to make us laugh. The answer to the question, Why do we laugh at the actions of clowns? would be that they appear to us immoderate and inappropriate; that is, we really laugh over the excessive expenditure of energy. Let us look for the same condition outside of the manufactured comic, that is, under circumstances where it may unintentionally be found. The child's motions do not appear to us comical, even if it jumps and fidgets, but it is comical to see a little boy or girl follow with the tongue the movement of his pen-holder when he is trying to master the art of writing; we see in these additional motions a superfluous expenditure of

energy which under similar conditions we should save. In the same way we find it comical to see unnecessary motions or even marked exaggeration of expressive motions in adults. Among the genuinely comic cases we might mention the motions made by the bowler after he has released the ball while he is following its course as though he were still able to control it; all grimaces which exaggerate the normal expression of the emotions are comical, even if they are involuntary, as in the case of persons suffering from St. Vitus' dance (chorea); the impassioned movements of a modern orchestra leader will appear comical to every unmusical person, who cannot understand why they are necessary. Indeed, the comic element found in bodily shapes and physiognomy is a branch of the comic of motion, in that they are conceived as though they were the result of motion that either has been carried too far or is purposeless. Wide exposed eyes, a crook-shaped nose bent towards the mouth, handle-like ears, a hunch back, and all similar physical defects probably produce a comical impression only in so far as the movements that would be necessary to produce these features are imagined, whereby the nose and other parts of the body are pictured as more movable than they actually are. It is certainly comical if some one can "wiggle his ears," and it would undoubtedly be a great deal more comical if he could raise and lower his nose. A large part of the comical impression that animals make upon us is due to the fact that we perceive in them movements which we cannot imitate.

Comic of Motion

But how does it come about that we laugh as soon as we have recognized that the actions of some one else are immoderate and inappropriate? I believe that we laugh because we compare the motions observed in others with those which we ourselves should produce if we were in their place. The two persons must naturally be compared in accordance with the same standard, but this standard is my own innervation expenditure connected with my idea of motion in the one case as well as the other. This assertion is in need of discussion and amplification.

What we are here putting into juxtaposition is, on the one hand, the psychic expenditure of a given idea, and on the other hand, the content of this idea. We maintain that the former is not primarily and principally independent of the latter — the content of the idea — particularly because

the idea of something great requires a larger expenditure than the idea of something small. As long as we are concerned only with the idea of different coarse movements we shall encounter no difficulties in the theoretical determination of our thesis or in establishing its proof through observation. It will be shown that in this case an attribute of the idea actually coincides with an attribute of the object conceived, although psychology warns us of confusions of this sort.

I obtain an idea of a definite coarse movement by performing this motion or by imitating it, and in so doing I set a standard for this motion in my feelings of innervation. [4]

Now if I perceive a similar more or less coarse motion in some one else, the surest way to the understanding — to apperception — of the same is to carry it out imitatively and the comparison will then enable me to decide in which motion I expended more energy. Such an impulse to imitate certainly arises on perceiving a movement. But in reality I do not carry out the imitation any more than I still spell out words simply because I have learnt to read by means of spelling. Instead of imitating the movement by my muscles I substitute the idea of the same through my memory traces of the expenditures necessary for similar motions. Perceiving, or "thinking," differs above all from acting or carrying out things by the fact that it entails a very much smaller displacement of energy and keeps the main expenditure from being discharged. But how is the quantitative factor, the more or less big element of the movement perceived, given expression in the idea? And if the representation of the quantity is left off from the idea that is composed of qualities, how am I to differentiate the ideas of different big movements, how am I to compare them?

Here, physiology shows the way in that it teaches us that even while an idea is in the process of conception innervations proceed to the muscles, which naturally represent only a moderate expenditure. It is now easy to assume that this expenditure of innervation which accompanies the conception of the idea is utilized to represent the quantitative factor of the idea, and that when a great motion is imagined it is greater than it would be in the case of a small one. The conception of greater motions would thus actually be greater, that is, it would be a conception accompanied by greater expenditure.

Ideational Mimicry

Observation shows directly that human beings are in the habit of expressing the big and small things in their ideation content by means of a manifold expenditure or by means of a sort of *ideational mimicry.*

When a child or a person of the common people or one belonging to a certain race imparts or depicts something, one can easily observe that he is not content to make his ideas intelligible to the hearer through the choice of correct words alone, but that he also represents the contents of the same through his expressive motions. Thus he designates the quantities and intensities of "a high mountain" by raising his hands over his head, and those of "a little dwarf" by lowering his hand to the ground. If he broke himself of the habit of depicting with his hands, he would nevertheless do it with his voice, and if he should also control his voice, one may be sure that in picturing something big he would distend his eyes, and describing something little he would press his eyes together. It is not his own affects that he thus expresses, but it is really the content of what he imagines.

Shall we now assume that this need for mimicry is first aroused through the demand for imparting, whereas a good part of this manner of representation still escapes the attention of the hearer? I rather believe that this mimicry, though less vivid, exists even if all imparting is left out of the question, that it comes about when the person imagines for himself alone, or thinks of something in a graphic manner; that then such a person, just as in talking, expresses through his body the idea of big and small which manifests itself at least through a change of innervation in the facial expressions and sensory organs. Indeed, I can imagine that the bodily innervation which is consensual to the content of the idea conceived is the beginning and origin of mimicry for purposes of communication. For, in order to be in a position to serve this purpose, it is only necessary to increase it and make it conspicuous to the other. When I take the view that this "expression of the ideation content" should be added to the expression of the emotions, which are known as a physical by-effect of psychic processes, I am well aware that my observations which refer to the category of the big and small do not exhaust the subject. I myself could add still other things, even before reaching to the phenomenon of tension through which a person physically indicates the accumulation of his attention and the *niveau* of abstraction upon which his thoughts happen to rest. I maintain that this subject is very important, and I believe that

tracing the ideation mimicry in other fields of æsthetics would be just as useful for the understanding of the comic as it is here.

To return to the comic movement, I repeat that with the perception of a certain motion the impulse to conceive it will be given through a certain expenditure. In the "desire to understand," in the apperception of this movement I produce a certain expenditure, and I behave in this part of the psychic process just as if I put myself in the place of the person observed. Simultaneously I probably grasp the aim of the motion, and through former experiences I am able to estimate the amount of expenditure necessary to attain this aim. I thereby drop out of consideration the person observed and behave as if I myself wished to attain the aim of the motion. These two ideational possibilities depend on a comparison of the motion observed with my own inhibited motion. In the case of an immoderate or inappropriate movement on the part of the other, my greater expenditure for understanding becomes inhibited *statu nascendi* during the mobilization as it were, it is declared superfluous and stands free for further use or for discharge through laughing. If other favorable conditions supervened this would be the nature of the origin of pleasure in comic movement, — an innervation expenditure which, when compared with one's own motion, becomes an inapplicable surplus.

Comparison of Two Kinds of Expenditure as Pleasure-sources

We now note that we must continue our discussion by following two different paths; first, to determine the conditions for the discharge of the surplus; secondly, to test whether the other cases of the comic can be conceived similarly to our conception of comic motion.

We shall turn first to the latter task and after considering comic movement and action we shall turn to the comic found in the psychic activities and peculiarities of others.

As an example of this kind we may consider the comical nonsense produced by ignorant students at examinations; it is more difficult, however, to give a simple example of the peculiarities. We must not be confused by the fact that nonsense and foolishness which so often act in a comical manner are nevertheless not perceived as comical in all cases, just as the same things which once made us laugh because they seemed comical later may appear to us contemptible and hateful. This fact, which we must not forget to take into account, seems only to show that besides

the comparison familiar to us other relations come into consideration for the comic effect, — conditions which we can investigate in other connections.

The comic found in the mental and psychic attributes of another person is apparently again the result of a comparison between him and my own ego. But it is remarkable that it is a comparison which mostly furnishes the result opposite to that obtained through comic movement and action. In the latter case it is comical if the other person assumes a greater expenditure than I believe to be necessary for me; in the case of psychic activity it is just the reverse, it is comical if the other person economizes in expenditure, which I consider indispensable; for nonsense and foolishness are nothing but inferior activities. In the first case I laugh because he makes it too difficult for himself, and in the latter case because he makes it too easy for himself. In the case of the comic effect it seems to be a question only of the difference between the two energy expenditures — the one of "feeling one's self into something" (*Einfühlung*) — and the other of the ego — and it makes no difference in whose favor this difference inclines. This peculiarity, which at first confuses our judgment, disappears, however, when we consider that it is in accord with our personal development towards a higher stage of culture, to limit our muscular work and increase our mental work. By heightening our mental expenditure we produce a diminution of motion expenditure for the same activity. Our machines bear witness to this cultural success. [5]

Thus it coincides with a uniform understanding that that person appears comical to us who puts forth too much expenditure in his psychical activities and too little in his mental activities; and it cannot he denied that in both cases our laughing is the expression of a pleasurably perceived superiority which we adjudge to ourselves in comparison with him. If the relation in both cases becomes reversed, that is, if the somatic expenditure of the other is less and the psychic expenditure greater, then we no longer laugh, but are struck with amazement and admiration. [6]

Comic of Situation

The origin of the comic pleasure discussed here, that is, the origin of such pleasure in a comparison of the other person with one's own self in respect to the difference between the identification expenditure (*Einfühlungsaufwand*) and normal expenditure — is genetically probably

the most important. It is certain, however, that it is not the only one. We have learned before to disregard any such comparison between the other person and one's self, and to obtain the pleasure-bringing difference from one side only, either from identification, or from the processes in one's own ego, proving thereby that the feeling of superiority bears no essential relations to comic pleasure. A comparison is indispensable, however, for the origin of this pleasure, and we find this comparison between two energy expenditures which rapidly follow each other and refer to the same function. It is produced either in ourselves by way of identification with the other, or we find it without any identification in our own psychic processes. The first case, in which the other person still plays a part, though he is not compared with ourselves, results when the pleasure-producing difference of energy expenditures comes into existence through outer influences which we can comprehend as a "situation," for which reason this species of comic is also called the "comic of situation." The peculiarities of the person who furnishes the comic do not here come into essential consideration; we laugh when we admit to ourselves that had we been placed in the same situation we should have done the same thing. Here we draw the comic from the relation of the individual to the often all-too-powerful outer world, which is represented in the psychic processes of the individual by the conventions and necessities of society, and even by his bodily needs. A typical example of the latter is when a person engaged in an activity, which claims all his psychic forces, is suddenly disturbed by a pain or excremental need. The opposite case which furnishes us the comic difference through identification, lies between the great interest which existed before the disturbance occurred and the minimum left for his psychic activity after the disturbance made its appearance. The person who furnishes us this difference again becomes comical through inferiority; but he is only inferior in comparison with his former ego and not in comparison with us, for we know that in a similar case we could not have behaved differently. It is remarkable, however, that we find this inferiority of the person only in the case where we "feel ourselves" into some one, that is, we can only find it comical in the other, whereas we ourselves are conscious only of painful emotions when such or similar embarrassments happen to us. It is by keeping away the painful from our own person that we are probably first enabled to enjoy as

pleasurable the difference which resulted from the comparison of the changing energy.

Comic of Expectation

The other source of the comic, which we find in our own changes of investing energy, lies in our relations to the future, which we are accustomed to anticipate through our ideas of expectation. I assume that a quantitatively determined expenditure underlies our every idea of expectation, which in case of disappointment becomes diminished by a certain difference, and I again refer to the observations made before concerning "ideational mimicry." But it seems to me easier to demonstrate the real mobilized psychic expenditure for the cases of expectation. It is well known concerning a whole series of cases that the manifestation of expectation is formed by motor preliminaries; this is first of all true of cases in which the expected events make demands on my motility, and these preparations are quantitatively determinable without anything further. If I am expecting to catch a ball thrown at me, I put my body in states of tension in order to enable me to withstand the collision with the ball, and the superfluous motions which I make if the ball turns out to be light make me look comical to the spectators. I allowed myself to be misled by the expectation to exert an immoderate expenditure of motion. A similar thing happens if, for example, I lift out a basket of fruit which I took to be heavy but which was hollow and formed out of wax in order to deceive me. By its upward jerk my arm betrays the fact that I have prepared a superfluous innervation for this purpose and hence I am laughed at. In fact there is at least one case in which the expectation expenditure can be directly demonstrated by means of physiological experimentation with animals. In Pawlof's experiments with salivary secretions of dogs who, provided with salivary fistulæ, are shown different kinds of food, it is noticed that the amount of saliva secreted through the fistulæ depends on whether the conditions of the experiment have strengthened or disappointed the dogs' expectation to be fed with the food shown them.

Even where the thing expected lays claims only to my sensory organs, and not to my motility, I may assume that the expectation manifests itself in a certain motor emanation causing tension of the senses, and I may even conceive the suspension of attention as a motor activity which is

equivalent to a certain amount of expenditure. Moreover, I can presuppose that the preparatory activity of expectation is not independent of the amount of the expected impression, but that I represent mimically the bigness and smallness of the same by means of a greater or smaller preparatory expenditure, just as in the case of imparting something and in the case of thinking when there is no expectation. The expectation expenditure naturally will be composed of many components, and also for my disappointment diverse factors will come into consideration; it is not only a question whether the realized event is perceptibly greater or smaller than the expected one, but also whether the expectation is worthy of the great interest which I had offered for it. In this manner I am instructed to consider, besides the expenditure for the representation of bigness and smallness (the conceptual mimicry), also the expenditure for the tension of attention (expectation expenditure), and in addition to these two expenditures there is in all cases the abstraction expenditure. But these other forms of expenditure can easily be reduced to the one of bigness and smallness, for what we call more interesting, more sublime, and even more abstract, are only particularly qualified special cases of what is greater. Let us add to this that, among other things, Lipps holds that the quantitative, not the qualitative, contrast is primarily the source of comic pleasure, and we shall be altogether content to have chosen the comic element of motion as the starting-point of our investigation.

In working out Kant's thesis, "The comic is an expectation dwindled into nothing," Lipps made the attempt in his book, often cited here, to trace the comic pleasure altogether to expectation. Despite the many instructive and valuable results which this attempt brought to light I should like to agree with the criticism expressed by other authors, namely, that Lipps has formulated a field of origin of the comic which is much too narrow, and that he could not subject its phenomena to his formula without much forcing.

Caricature

Human beings are not satisfied with enjoying the comic as they encounter it in life, but they aim to produce it purposely, thus we discover more of the nature of the comic by studying the methods employed in producing the comic. Above all one can produce comical elements in one's personality for the amusement of others, by making one's self appear

awkward or stupid. One then produces the comic exactly as if one were really so, by complying with the condition of comparison which leads to the difference of expenditure; but one does not make himself laughable or contemptible through this; indeed, under certain circumstances one can even secure admiration. The feeling of superiority does not come into existence in the other when he knows that the actor is only shamming, and this furnishes us a good new proof that the comic is independent in principle of the feeling of superiority.

To make another comical, the method most commonly employed is to transfer him into situations wherein he becomes comical regardless of his personal qualities, as a result of human dependence upon external circumstances, especially social factors; in other words, one resorts to the comical situation. This transferring into a comic situation may be real as in practical jokes, such as placing the foot in front of one so that he falls like a clumsy person, or making one appear stupid by utilizing his credulity to make him believe some nonsense, etc., or it can be feigned by means of speech or play. It is a good aid in aggression, in the service of which production of the comic is wont to place itself in order that the comic pleasure may be independent of the reality of the comic situation; thus every person is really defenseless against being made comical.

But there are still other means of making one comical which deserve special attention and which in part also show new sources of comic pleasure. *Imitation,* for example, belongs here; it accords the hearer an extraordinary amount of pleasure and makes its subject comic, even if it still keeps away from the exaggeration of caricature. It is much easier to fathom the comic effect of caricature than that of simple imitation. Caricature, parody and travesty, like their practical counterpart — unmasking, range themselves against persons and objects who command authority and respect and who are exalted in some sense — these are procedures tending towards degradation. [7] In the transferred psychic sense, the exalted is equivalent to something great and I want to make the statement, or more accurately to repeat the statement, that psychic greatness like somatic greatness is exhibited by means of an increased expenditure. It needs little observation to ascertain that when I speak of the exalted I give a different innervation to my voice, I change my facial expression, an attempt to bring my entire bearing as it were into complete accord with the dignity of that which I present. I impose upon myself a

dignified restriction not much different than if I were coming into the presence of an illustrious personage, monarch, or prince of science. I can scarcely err when I assume that this added innervation of conceptual mimicry corresponds to an increased expenditure. The third case of such an added expenditure I readily find when I indulge in abstract trains of thought instead of in the concrete and plastic ideas. If I can now imagine that the mentioned processes for degrading the illustrious are quite ordinary, that during their activity I need not be on my guard and in whose ideal presence I may, to use a military formula, put myself "at ease," all that saves me the added expenditure of dignified restriction. Moreover, the comparison of this manner of presentation instigated by identification with the manner of presentation to which I have been hitherto accustomed which seeks to present itself at the same time, again produces a difference in expenditure which can be discharged through laughter.

As is known, caricature brings about the degradation by rendering prominent one feature, comic in itself, from the entire picture of the exalted object, a feature which would be overlooked if viewed with the entire picture. Only by isolating this feature can the comic effect be obtained which spreads in our memory over the whole picture. This has, however, this condition; the presence of the exalted itself must not force us into a disposition of reverence. Where such a comical feature is really lacking then caricature unhesitatingly creates it by exaggerating one that is not comical in itself. It is again characteristic of the origin of comic pleasure that the effect of the caricature is not essentially impaired through such a falsifying of reality.

Unmasking

Parody and *travesty* accomplish the degradation of the exalted by other means; they destroy the uniformity between the attributes of persons familiar to us and their speech and actions; by replacing either the illustrious persons or their utterances by lowly ones. Therein they differ from caricature, but not through the mechanism of the production of the comic pleasure. The same mechanism also holds true in *unmasking,* which comes into consideration only where some one has attached to himself dignity and authority which in reality should be taken from him. We have seen the comic effect of unmasking through several examples of wit, for example, in the story of the fashionable lady who in her first labor-pains

cries: “Ah, mon Dieu!” but to whom the physician paid no attention until she screamed: “A-a-a-ai-e-e-e-e-e-e-e-E-E-E!” Being now acquainted with the character of the comic, we can no longer dispute that this story is really an example of comical unmasking and has no just claim to the term witticism. It recalls wit only through the setting, through the technical means of “representation through a trifle”; here it is the cry which was found sufficient to indicate the point. The fact remains, however, that our feeling for the niceties of speech, when we call on it for judgment, does not oppose calling such a story a witticism. We can find the explanation for this in the reflection that usage of speech does not enter scientifically into the nature of wit so far as we have evolved it by means of this painstaking examination. As it is a function of the activities of wit to reopen hidden sources of comic pleasure (p. 150), every artifice which does not bring to light barefaced comic may in looser analogy be called a witticism. This is especially true in the case of unmasking, though in other methods of comic-making the appellation also holds good. [8]

In the mechanism of “unmasking” one can also utilize those processes of comic-making already known to us which degrade the dignity of individuals in that they call attention to one of the common human frailties, but particularly to the dependence of his mental functions upon physical needs. Unmasking them becomes equivalent to the reminder: This or that one who is admired like a demigod is only a human being like you and me after all. Moreover, all efforts in this mechanism serve to lay bare the monotonous psychic automatism which is behind wealth and apparent freedom of psychic achievements. We have become acquainted with examples of such “unmasking” through the witticisms dealing with marriage agents, and at that time to be sure we felt doubt whether we could rightly count these stories as wit. Now we can decide with more certainty that the anecdote of the echo who reinforces all assertions of the marriage agent and in the end reinforces the latter’s admission that the bride has a hunch back with the exclamation “And what a hunch!” is essentially a comic story, an example of the unmasking of the psychic automatism. But here the comic story serves only as a façade; to any one who wishes to note the hidden meaning of the marriage agent, the whole remains a splendidly put together piece of wit. He who does not penetrate so far sees only the comic story. The same is true of the other witticism of the agent who, to refute an objection, finally confirms the truth through

the exclamation: “But who in the world would lend them anything?” This is a comic unmasking which serves as a façade for a witticism. Still the character of the wit is here quite evident, as the speech of the agent is at the same time an expression through the opposite. In trying to prove that the people are rich he proves at the same time that they are not rich but very poor. Wit and the comic unite here and teach us that a statement may be simultaneously witty and comical.

We eagerly grasp the opportunity to return from the comic of unmasking to wit, for our real task is to explain the relation between wit and comic and not to determine the nature of the comic. Hence to the case of uncovering the psychic automatism, wherein our feeling left us in doubt as to whether the matter was comical or witty, we add another, the case of nonsense-wit, wherein likewise wit and the comic fuse. But our investigation will ultimately show us that in this second case the meeting of wit and comic may be theoretically deduced.

In the discussion of the techniques of wit we have found that giving free play to such modes of thinking as are common in the unconscious and which in consciousness are conceived only as “faulty thinking,” furnishes the technical means of a great many witticisms. We had then doubted their witty character and were inclined to classify them simply as comic stories. We could come to no decision regarding our uncertainty because in the first place the real character of wit was not familiar to us. Later we found this character by following the analogy to the dream-work as to the compromise formed by the wit-work between the demands of the rational critic and the impulse not to abandon the old word-pleasure and nonsense-pleasure. What thus came into existence as a compromise, when the foreconscious thought was left for a moment to unconscious elaboration, satisfied both demands in all cases, but it presented itself to the critic, in various forms and had to stand various criticisms from it. In one case wit succeeded in surreptitiously assuming the form of an unimportant but none the less admissible proposition; a second time it smuggled itself into the expression of a valuable thought. But within the outer limit of the compromise activity it made no effort to satisfy the critic, and defiantly utilizing the pleasure-sources at its disposal, it appeared before the critic as pure nonsense. It had no fear of provoking contradiction because it could rely on the fact that the hearer would decipher the disfigurement of

the expression through the operation of his unconscious and thus give back to it its meaning.

Now in what case will wit appear to the critic as nonsense? Particularly when it makes use of those modes of thought, which are common in the unconscious, but forbidden in conscious thought; that is, when it resorts to faulty thinking. Some of the modes of thinking, of the unconscious, have also been retained in conscious thinking, for example, many forms of indirect expression, allusions, etc., even though their conscious use has to be much restricted. Using these techniques wit will arouse little or no opposition on the part of the critic; but this only happens when it also uses that technical means with which conscious thought no longer cares to have anything to do. Wit can still further avoid offending if it disguises the faulty thinking by investing it with a semblance of logic as in the story of the fancy cake and liqueur, salmon with mayonnaise, and similar ones. But should it present the faulty thinking undisguised, the critic is sure to protest.

The Meeting of Wit and the Comic

In this case, something else comes to the aid of wit. The faulty thinking, which as a form of thinking of the unconscious, wit utilizes for its technique, appears comical to the critic, although this is not necessarily the case. The conscious giving of free play to the unconscious and to those forms of thinking which are rejected as faulty, furnishes a means for the production of comic pleasure. This can be easily understood, as a greater expenditure is surely needed for the production of the foreconscious investing energy than for the giving of free play to the unconscious. When we hear the thought which is formed like one from the unconscious we compare it to its correct form, and this results in a difference of expenditure which gives origin to comic pleasure. A witticism which makes use of such faulty thinking as its technique and therefore appears absurd can produce a comic impression at the same time. If we do not strike the trail of the wit, there remains to us only the comic or funny story.

The story of the borrowed kettle, which showed a hole on being returned, whereupon the borrower excused himself by stating that in the first place he had not borrowed the kettle; secondly, that it already had a hole when he borrowed it; and thirdly, that he had returned it intact

without any hole (p. 82), is an excellent example of a purely comic effect through giving free play to one's unconscious modes of thinking. Just this mutual neutralization of several thoughts, each of which is well motivated in itself, is the province of the unconscious. Corresponding to this, the dream in which the unconscious thoughts become manifest, also shows an absence of either-or. [9] These are expressed by putting the thoughts next to one another. In that dream example given in my *Interpretation of Dreams*, [10] which in spite of its complication I have chosen as a type of the work of interpretation, I seek to rid myself of the reproach that I have not removed the pains of a patient by psychic treatment. My arguments are: 1. she is herself to blame for her illness, because she does not wish to accept my solution, 2. her pains are of organic origin, therefore none of my concern, 3. her pains are connected with her widowhood, for which I am certainly not to blame, 4. her pains resulted from an injection with a dirty syringe, which was given by another. All these motives follow one another just as though one did not exclude the other. In order to escape the reproach that it was nonsense I had to insert the words "either-or" instead of the "and" of the dream.

A similar comical story is the one which tells of a blacksmith in a Hungarian village who has committed a crime punishable by death; the bürgomaster, however, decreed that not the smith but a tailor was to be hanged, as there were two tailors in the village but only one blacksmith, and the crime had to be expiated. Such a displacement of guilt from one person to another naturally contradicts all laws of conscious logic, but in no ways the mental trends of the unconscious. I am in doubt whether to call this story comic, and still I put the story of the kettle among the witticisms. Now I admit that it is far more correct to designate the latter as comic rather than witty. But now I understand how it happens that my feelings, usually so reliable, can leave me in the lurch as to whether this story be comic or witty. The case in which I cannot come to a conclusion through my feelings is the one in which the comic results through the uncovering of modes of thought which exclusively belong to the unconscious. A story of that kind can be comic and witty at the same time; but it will impress me as being witty even if it be only comic, because the use of the faulty thinking of the unconscious reminds me of wit, just as in the case of the arrangements for the uncovering of the hidden comic discussed before (p. 325).

I must lay great stress upon making clear this most delicate point of my analysis, namely, the relation of wit to the comic, and will therefore supplement what has been said with some negative statements. First of all, I call attention to the fact that the case of the meeting of wit and comic treated here (p. 327) is not identical with the preceding one. I grant it is a fine distinction, but it can be drawn with certainty. In the preceding case the comic originated from the uncovering of the psychic automatism. This is in no way peculiar to the unconscious alone and it does not at all play a conspicuous part in the technique of wit. Unmasking appears only accidentally in relation with wit, in that it serves another technique of wit, namely, representation through the opposite. But in the case of giving free play to unconscious ways of thinking the union of wit and comic is an essential one, because the same method which is used by the first person in wit as the technique of releasing pleasure will naturally produce comic pleasure in the third person.

We might be tempted to generalize this last case and seek the relation of wit to the comic in the fact that the effect of wit upon the third person follows the mechanism of comic pleasure. But there is no question about that; contact with the comic is not in any way found in all nor even in most witticisms; in most cases wit and the comic can be cleanly separated. As often as wit succeeds in escaping the appearance of absurdity, which is to say in most witticisms of double meaning or of allusion, one cannot discover any effect in the hearer resembling the comic. One can make the test with examples previously cited or with some new ones given here.

Congratulatory telegram to be sent to a gambler on his 70th birthday.

"Trente et quarante" [11] (word-division with allusion).

Madame de *Maintenon* was called Madame de *Maintenant* (modification of a name).

We might further believe that at least all jokes with nonsense façades appear comical and must impress us as such. But I recall here the fact that such witticisms often have a different effect on the hearer, calling forth confusion and a tendency to rejection (see footnote, p. 212). Therefore it evidently depends whether the nonsense of the wit appears comical or common plain nonsense, and the conditions for this we have not yet investigated. Accordingly we hold to the conclusion that wit, judging by its nature, can be separated from the comic, and that it unites with it on the

one hand only in certain special cases, on the other in the tendency to gain pleasure from intellectual sources.

In the course of these examinations concerning the relations of wit and the comic there revealed itself to us that distinction which we must emphasize as most significant, and which at the same time points to a psychologically important characteristic of the comic. We had to transfer to the unconscious the source of wit-pleasure; there is no occasion which can be discovered for the same localization of the comic. On the contrary all analyses which we have made thus far indicate that the source of comic pleasure lies in the comparison of two expenditures, both of which we must adjudged to the foreconscious. Wit and the comic can above all be differentiated in the psychic localization; *wit is, so to speak, the contribution to the comic from the sphere of the unconscious.*

Comic of Imitation

We need not blame ourselves for digressing from the subject, for the relation of wit to the comic is really the occasion which urged us to the examination of the comic. But it is time for us to return to the point under discussion, to the treatment of the means which serve to produce the comic. We have advanced the discussion of caricature and unmasking, because from both of them we can borrow several points of similarity for the analysis of the comic of *imitation.* Imitation is mostly replaced by caricature, which consists in the exaggeration of certain otherwise not striking traits, and also bears the character of degradation. Still this does not seem to exhaust the nature of imitation; it is incontestable that in itself it represents an extraordinarily rich source of comic pleasure, for we laugh particularly over faithful imitations. It is not easy to give a satisfactory explanation of this if we do not accept Bergson's view, [12] according to which the comic of imitation is put next to the comic produced by uncovering the psychic automatism. Bergson believes that everything gives a comic impression which manifests itself in the shape of a machine-like inanimate movement in the human being. His law is that "the attitudes, gestures, and movements of the human body are laughable in exact proportion as that body reminds us of a mere machine." He explains the comic of imitation by connecting it with a problem formulated by Pascal in his *Thoughts,* why is it that we laugh at the comparison of two faces that are alike although neither of them excites

laughter by itself. “The truth is that a really living life should never repeat itself. Wherever there is repetition or complete similarity, we always suspect some mechanism at work behind the living.” Analyze the impression you get from two faces that are too much alike, and you will find that you are thinking of two copies cast in the same mould, or two impressions of the same soul, or two reproductions of the same negative, — in a word, of some manufacturing process or other. This deflection of life towards the mechanical is here the real cause of laughter (l. c., p. 34). We might say, it is the degradation of the human to the mechanical or inanimate. If we accept these winning arguments of Bergson, it is moreover not difficult to subject his view to our own formula. Taught by experience that every living being is different and demands a definite amount of expenditure from our understanding, we find ourselves disappointed when, as a result of a perfect agreement or deceptive imitation, we need no new expenditure. But we are disappointed in the sense of being relieved, and the expenditure of expectation which has become superfluous is discharged through laughter. The same formula will also cover all cases of comic rigidity considered by Bergson, such as professional habits, fixed ideas, and modes of expression which are repeated on every occasion. All these cases aim to compare the expenditure of expectation with what is commonly required for the understanding, whereby the greater expectation depends on observation of individual variety and human plasticity. Hence in imitation the source of comic pleasure is not the comic of situation but that of expectation.

As we trace the comic pleasure in general to comparison, it is incumbent upon us to investigate also the comic element of the comparison itself, which likewise serves as a means of producing the comic. Our interest in this question will be enhanced when we recall that in the case of comparison the “feeling” as to whether something was to be classed as witty or merely comical often left us in the lurch (v. p. 114).

The subject really deserves more attention than we can bestow upon it. The main quality for which we ask in comparison is whether it is pertinent, that is, whether it really calls our attention to an existing agreement between two different objects. The original pleasure in refinding the same thing (Groos, p. 103) is not the only motive which favors the use of comparison. Besides this there is the fact that comparison is capable of a utilization which facilitates intellectual work; when for

example, as is usually the case, one compares the less familiar to the more familiar, the abstract to the concrete, and explains through this comparison the more strange and the more difficult objects. With every such comparison, especially of the abstract to the concrete, there is a certain degradation and a certain economy in abstraction expenditure (in the sense of a conceptual mimicry) yet this naturally does not suffice to render prominent the character of the comic. The latter does not emerge suddenly from the freed pleasure of the comparison but comes gradually; there are many cases which only touch the comic, in which one might doubt whether they show the comic character. The comparison undoubtedly becomes comical when the *niveau* difference of the expenditure of abstraction between the two things compared becomes increased, if something serious and strange, especially of intellectual or moral nature is compared to something banal and lowly. The former release of pleasure and the contribution from the conditions of conceptual mimicry may perhaps explain the gradual change — which is determined by quantitative relations, — from the universally pleasurable to the comic, which takes place during the comparison. I am certainly avoiding misunderstandings in that I emphasize that I deduce the comic pleasure in the comparison, not from the contrast of the two things compared but from the difference of the two abstraction expenditures. The strange which is difficult to grasp, the abstract and really intellectually sublime, through its alleged agreement with a familiar lowly one, in the imagination of which every abstraction expenditure disappears, is now itself unmasked as something equally lowly. The comic of comparison thus becomes reduced to a case of degradation.

The comparison, as we have seen above, can now be witty without a trace of comic admixture, especially when it happens to evade the degradation. Thus the comparison of Truth to a torch which one cannot carry through a crowd without singeing somebody’s beard is pure wit, because it takes an obsolete expression (“The torch of truth”) at its full value and not at all in a comical sense, and because the torch as an object does not lack a certain distinction, though it is a concrete object. However, a comparison may just as well be witty as comic, and what is more one may be independent of the other, in that the comparison becomes an aid for certain techniques of wit, as, for example, unification or allusion. Thus

Nestroy's comparison of memory to a "Warehouse" (p. 120) is simultaneously comical and witty, first, on account of the extraordinary degradation to which the psychological conception must consent in the comparison to a "Warehouse," and secondly, because he who utilizes the comparison is a clerk, and in this comparison he establishes a rather unexpected unification between psychology and his vocation. Heine's verse, "until at last the buttons tore from the pants of my patience," seems at first an excellent example of a comic degrading comparison, but on closer reflection we must ascribe to it also the attribute of wittiness, since the comparison as a means of allusion strikes into the realm of the obscene and causes a release of pleasure from the obscene. Through a union not altogether incidental the same material also gives us a resultant pleasure which is at the same time comical and witty; it does not matter whether or not the conditions of the one promote the origin of the other, such a union acts confusingly on the "feeling" whose function it is to announce to us whether we have before us wit or the comic, and only a careful examination independent of the disposition of pleasure can decide the question.

As tempting as it would be to trace these more intimate determinations of comic pleasure, the author must remember that neither his previous education nor his daily vocation justifies him in extending his investigations beyond the spheres of wit, and he must confess that it is precisely the subject of comic comparison which makes him feel his incompetence.

We are quite willing to be reminded that many authors do not recognize the clear notional and objective distinction between wit and comic, as we were impelled to do, and that they classify wit merely as "the comic of speech" or "of words." To test this view let us select one example of intentional and one of involuntary comic of speech and compare it with wit. We have already mentioned before that we are in a good position to distinguish comic from witty speech. "With a fork and with effort, his mother pulled him out of the mess," is only comical, but Heine's verse about the four castes of the population of Göttingen: "Professors, students, Philistines, and cattle," is exquisitely witty.

As an example of the intentional comic of speech I will take as a model Stettenheim's *Wippchen.* We call Stettenheim witty because he possesses the cleverness that evokes the comic. The wit which one "has" in

contradistinction to the wit which one “makes,” is indeed correctly conditioned by this ability. It is true that the letters of Wippchen are also witty in so far as they are interspersed with a rich collection of all sorts of witticisms, some of which very successful ones, (as “festively undressed” when he speaks of a parade of savages), but what lends the peculiar character to these productions is not these isolated witticisms, but the superabundant flow of comic speech contained therein. Originally *Wippchen* was certainly meant to represent a satirical character, a modification of Freytag’s Schmock, one of those uneducated persons who trade in the educational treasure of the nation and abuse it; but the pleasure in the comic effect experienced in representing this person seems gradually to have pushed to the background the author’s satirical tendency. Wippchen’s productions are for the most part “comic nonsense.” The author has justly utilized the pleasant mood resulting from the accumulation of such achievements to present beside the altogether admissible material all sorts of absurdities which would be intolerable in themselves. Wippchen’s nonsense appears to be of a specific nature only on account of its special technique. If we look closer into some of these “witticisms,” we find that some forms which have impressed their character on the whole production are especially conspicuous. Wippchen makes use mostly of compositions (fusions), of modifications of familiar expressions and quotations. He replaces some of the banal elements in these expressions by others which are usually more pretentious and more valuable. This naturally comes near to the techniques of wit.

The Comic of Speech

Some of the fusions taken from the preface and the first pages are the following: *“Turkey’s money is like the hay of the sea.”* This is only a condensation of the two expressions, “Money like hay,” “Money like the sands of the sea.” Or: *“I am nothing but a leafless pillar which tells of a vanished splendor,”* which is a fusion of “leafless trunk” and “a pillar which, etc.” Or: *“Where is Ariadne’s thread which leads out of the Scylla of this Augean stable?”* for which three different Greek myths contribute an element each.

The modifications and substitutions can be treated collectively without much forcing; their character can be seen from the following examples which are peculiar to Wippchen, they are regularly permeated by a

different wording which is more fluent, most banal, and reduced to mere platitudes.

"To hang my paper and ink high." The saying: "To hang one's bread-basket high," expresses metaphorically the idea of placing one under difficult conditions. But why not stretch this figure to other material?

"Already in my youth Pegasus was alive in me." When the word "pegasus" is replaced by "the poet," one can recognize it as an expression often used in autobiographies. Naturally "pegasus" is not the proper word to replace the words "the poet," but it has thought associations to it and is a high-sounding word.

From Wippchen's other numerous productions some examples can be shown which present the pure comic. As an example of comic disillusionment the following can be cited: *"For hours the battle raged, finally it remained undecisive";* an example of comical unmasking (of ignorance) is the following: *"Clio, the Medusa of history,"* or quotations like the following: *"Habent sua fata morgana."* But our interest is aroused more by the fusions and modifications because they recall familiar techniques of wit. We may compare them to such modification witticisms as the following: "He has a great future behind him," and Lichtenberg's modification witticisms such as: "New baths heal well," etc. Should Wippchen's productions having the same technique be called witticisms, or what distinguishes them from the latter?

It is surely not difficult to answer this. Let us remember that wit presents to the hearer a double face, and forces him to two different views. In nonsense-witticisms such as those mentioned last, one view, which considers only the wording, states that they are nonsense; the other view, which, in obedience to suggestion, follows the road that leads through the hearer's unconscious, finds very good sense in these witticisms. In Wippchen's wit-like productions one of these views of wit is empty, as if stunted. It is a Janus head with only one countenance developed. One would get nowhere should he be tempted to proceed by means of this technique to the unconscious. The condensations lead to no case in which the two fused elements really result in a new sense; they fall to pieces when an attempt is made to analyze them. As in wit, the modifications and substitutions lead to a current and familiar wording, but they themselves tell us little else and as a rule nothing that is of any possible use. Hence the only thing remaining to these "witticisms" is the nonsense view.

Whether such productions, which have freed themselves from one of the most essential characters of wit, should be called “bad” wit or not wit at all, every one must decide as he feels inclined.

There is no doubt that such stunted wit produces a comic effect for which we can account in more than one way. Either the comic originates through the uncovering of the unconscious modes of thinking in a manner similar to the cases considered above, or the wit originates by comparison with perfect wit. Nothing prevents us from assuming that we here deal with a union of both modes of origin of the comic pleasure. It is not to be denied that it is precisely the inadequate dependence on wit which here shapes the nonsense into comic nonsense.

Comic of Inadequacy

There are, of course, other quite apparent cases, in which such inadequacy produced by the comparison with wit, makes the nonsense irresistibly comic. The counterpart to wit, the riddle, can perhaps give us better examples for this than wit itself. A facetious question states: *What is this: It hangs on the wall and one can dry his hands on it? It would be a foolish riddle if the answer were: a towel. On the contrary this answer is rejected with the statement: No, it is a herring,— “But, for mercy’s sake,” is the objection, “a herring does not hang on the wall.”— “But you can hang it there,”— “But who wants to dry his hands on a herring?”— “Well,” is the soft answer, “you don’t have to.”* This explanation given through two typical displacements show how much this question lacks of being a real riddle, and because of this absolute insufficiency it impresses one as irresistibly comic, rather than mere nonsensical foolishness. Through such means, that is, by not restricting essential conditions, wit, riddles, and other forms, which in themselves produce no comic pleasure, can be made into sources of comic pleasure.

It is not so difficult to understand the case of the involuntary comic of speech which we can perhaps find realized with as much frequency as we like in the poems of Frederika Kempner. [13]

ANTI-VIVISECTION.

Fraternal sentiment should urge us
To champion the Guinea-pig,
For has it not a soul like ours,
Although most likely not as big?

Or a conversation between a loving couple.
THE CONTRAST.
The young wife whispers “I’m so happy,”
“And I!” chimes in her husband’s voice,
“Because your virtues, dearest help-mate,
Reveal the wisdom of my choice.”

There is nothing here which makes one think of wit. Doubtless, however, it is the inadequacy of these “poetic productions,” as the very extraordinary clumsiness of the expressions which recall the most commonplace or newspaper style, the ingenious poverty of thoughts, the absence of every trace of poetic manner of thinking or speaking, — it is all these inadequacies which make these poems comic. Nevertheless it is not at all self-evident that we should find Kempner’s poems comical; many similar productions we merely consider very bad, we do not laugh at them but are rather vexed with them. But here it is the great disparity in our demand of a poem which impels us to the comic conception; where this difference is less, we are inclined to criticise rather than laugh. The comic effect of Kempner’s poetic productions is furthermore assured by the additional circumstances of the lady author’s unmistakably good intentions, and by the fact that her helpless phrases disarm our feeling of mockery and anger. We are now reminded of a problem the consideration of which we have so far postponed. The difference of expenditure is surely the main condition of the comic pleasure, but observation teaches that such difference does not always produce pleasure. What other conditions must be added, or what disturbances must be checked in order that pleasure should result from the difference of expenditure? But before proceeding with the answers to these questions we wish to verify what was said in the conclusions of the former discussion, namely, that the comic of speech is not synonymous with wit, and that wit must be something quite different from speech comic.

As we are about to attack the problem just formulated, concerning the conditions of the origin of comic pleasure from the difference of expenditure, we may permit ourselves to facilitate this task so as to cause ourselves some pleasure. To give a correct answer to this question would amount to an exhaustive presentation of the nature of the comic for which we are fitted neither by ability nor authority. We shall therefore again be

content to elucidate the problem of the comic only so far as it distinctly separates itself from wit.

All theories of the comic were objected to by the critics on the ground that in defining the comic these theories overlooked the essential element of it. This can be seen from the following theories, with their objections. The comic depends on a contrasting idea; yes, in so far as this contrast effects one comically and in no other way. The feeling of the comic results from the dwindling away of an expectation; yes, if the disappointment does not prove to be painful. There is no doubt that these objections are justified, but they are overestimated if one concludes from them that the essential characteristic mark of the comic has hitherto escaped our conception. What depreciates the general validity of these definitions are conditions which are indispensable for the origin of the comic pleasure, but which will be searched in vain for the nature of comic pleasure. The rejection of the objections and the explanations of the contradictions to the definitions of the comic will become easy for us, only after we trace back comic pleasure to the difference resulting from a comparison of two expenditures. Comic pleasure and the effect by which it is recognized — laughter, can originate only when this difference is no longer utilizable and when it is capable of discharge. We gain no pleasurable effect, or at most a flighty feeling of pleasure in which the comic does not appear, if the difference is put to other use as soon as it is recognized. Just as special precautions must be taken in wit, in order to guard against making new use of expenditure recognized as superfluous, so also can comic pleasure originate only under relations which fulfil this latter condition. The cases in which such differences of expenditure originate in our ideational life are therefore uncommonly numerous, while the cases in which the comic originates from them is comparatively very rare.

The Conditions of Isolation of the Comic

Two observations obtrude themselves upon the observer who reviews even only superficially the origin of comic pleasure from the difference of expenditure; first, that there are cases in which the comic appears regularly and as if necessarily; and, in contrast to these cases, others in which this appearance depends on the conditions of the case and on the viewpoint of the observer; but secondly, that unusually large differences very often triumph over unfavorable conditions, so that the comic feeling

originates in spite of it. In reference to the first point one may set up two classes, the inevitable comic and the accidental comic, although one will have to be prepared from the beginning to find exceptions in the first class to the inevitableness of the comic. It would be tempting to follow the conditions which are essential to each class.

What is important in the second class are the conditions of which one may be designated as the “isolation” of the comic case. A closer analysis renders conspicuous relations something like the following:

a) The favorable condition for the origin of comic pleasure is brought about by a general happy disposition in which “one is in the mood for laughing.” In happy toxic states almost everything seems comic, which probably results from a comparison with the expenditure in normal conditions. For wit, the comic, and all similar methods of gaining pleasure from the psychic activities, are nothing but ways to regain this happy state — euphoria — from one single point, when it does not exist as a general disposition of the psyche.

b) A similar favorable condition is produced by the expectation of the comic or by putting one’s self in the right mood for comic pleasure. Hence when the intention to make things comical exists and when this feeling is shared by others, the differences required are so slight that they probably would have been overlooked had they been experienced in unpremeditated occurrences. He who decides to attend a comic lecture or a farce at the theater is indebted to this intention for laughing over things which in his everyday life would hardly produce in him a comic effect. He finally laughs at the recollection of having laughed, at the expectation of laughing, and at the appearance of the one who is to present the comic, even before the latter makes the attempt to make him laugh. It is for this reason that people admit that they are ashamed of that which made them laugh at the theater.

c) Unfavorable conditions for the comic result from the kind of psychic activity which may occupy the individual at the moment. Imaginative or mental activity tending towards serious aims disturbs the discharging capacity of the investing energies which the activity needs for its own displacements, so that only unexpected and great differences of expenditure can break through to form comic pleasure. All manner of mental processes far enough removed from the obvious to cause a suspension of ideational mimicry are unfavorable to the comic; in abstract

contemplation there is hardly any room left for the comic, except when this form of thinking is suddenly interrupted.

d) The occasion for releasing comic pleasure vanishes when the attention is fixed on the comparison capable of giving rise to the comic. Under such circumstances the comic force is lost from that which is otherwise sure to produce a comic effect. A movement or a mental activity cannot become comical to him whose interest is fixed at the time of comparing this movement with a standard which distinctly presents itself to him. Thus the examiner does not see the comical in the nonsense produced by the student in his ignorance; he is simply annoyed by it, whereas the offender's classmates who are more interested in his chances of passing the examination than in what he knows, laugh heartily over the same nonsense. The teacher of dancing or gymnastics seldom has any eyes for the comic movements of his pupils, and the preacher entirely loses sight of humanity's defects of character, which the writer of comedy brings out with so much effect. The comic process cannot stand examination by the attention, it must be able to proceed absolutely unnoticed in a manner similar to wit. But for good reasons, it would contradict the nomenclature of "conscious processes" which I have used in *The Interpretation of Dreams,* if one wished to call it of necessity *unconscious.* It rather belongs to the *foreconscious,* and one may use the fitting name "automatic" for all those processes which are enacted in the foreconscious and dispense with the attention energy which is connected with consciousness. The process of comparison of the expenditures must remain automatic if it is to produce comic pleasure.

Conditions Disturbing the Discharge

e) It is exceedingly disturbing to the comic if the case from which it originates gives rise at the same time to a marked release of affect. The discharge of the affective difference is then as a rule excluded. Affects, disposition, and the attitude of the individual in occasional cases make it clear that the comic comes or goes with the viewpoint of the individual person; that only in exceptional cases is there an absolute comic. The dependence or relativity of the comic is therefore much greater than of wit, which never happens but is regularly made, and at its production one may already give attention to the conditions under which it finds acceptance. But affective development is the most intensive of the

conditions which disturb the comic, the significance of which is well known. [14] It is therefore said that the comic feeling comes most in tolerably indifferent cases which evince no strong feelings or interests. Nevertheless it is just in cases with affective release that one may witness the production of a particularly strong expenditure-difference in the automatism of discharge. When Colonel Butler answers Octavio's admonitions with "bitter laughter," exclaiming:

"Thanks from the house of Austria!"

his bitterness has thus not prevented the laughter which results from the recollection of the disappointment which he believes he has experienced; and on the other hand, the magnitude of this disappointment could not have been more impressively depicted by the poet than by showing it capable of affecting laughter in the midst of the storm of unchained affects. It is my belief that this explanation may be applicable in all cases in which laughing occurs on other than pleasurable occasions, and in conjunction with exceedingly painful or tense affects.

f) If we also mention that the development of the comic pleasure can be promoted by means of any other pleasurable addition to the case which acts like a sort of contact-effect (after the manner of the fore-pleasure principle in the tendency-wit), then we have discussed surely not all the conditions of comic pleasure, yet enough of them to serve our purpose. We then see that no other assumption so easily covers these conditions, as well as the inconstancy and dependence of the comic effect, as this: the assumption that comic pleasure is derived from the discharge of a difference, which under many conditions can be diverted to a different use than discharge.

It still remains to give a thorough consideration of the comic of the sexual and obscene, but we shall only skim over it with a few observations. Here, too, we shall take the act of exposing one's body as the starting-point. An accidental exposure produces a comical effect on us, because we compare the ease with which we attained the enjoyment of this view with the great expenditure otherwise necessary for the attainment of this object. The case thus comes nearer to the naïve-comic, but it is simpler than the latter. In every case of exhibitionism in which we are made spectators — or, in the case of the smutty joke hearers, — we play the part of the third person, and the person exposed is made comical. We

have heard that it is the purpose of wit to replace obscenity and in this manner to reopen a source of comic pleasure that has been lost. On the contrary, spying out an exposure forms no example of the comic for the one spying, because the effort he exerts thereby abrogates the condition of comic pleasure; the only thing remaining is the sexual pleasure in what is seen. If the spy relates to another what he has seen, the person looked at again becomes comical, because the viewpoint that predominates is that the expenditure was omitted which would have been necessary for the concealment of the private parts. At all events, the sphere of the sexual or obscene offers the richest opportunities for gaining comic pleasure beside the pleasurable sexual stimulation, as it exposes the person's dependence on his physical needs (degradation) or it can uncover behind the spiritual love the physical demands of the same (unmasking.)

The Psychogenesis of the Comic

An invitation to seek the understanding of the comic in its psychogenesis comes surprisingly from Bergson's well written and stimulating book *Laughter.* Bergson, whose formula for the conception of the comic character has already become known to us— "mechanization of life," "the substitution of something mechanical for the natural" — reaches by obvious associations from automatism to the automaton, and seeks to trace a series of comic effects to the blurred memories of children's toys. In this connection he once reaches this viewpoint, which, to be sure, he soon drops; he seeks to trace the comic to the after-effect of childish pleasure. "Perhaps we ought even to carry simplification still farther, and, going back to our earliest recollection, try to discover in the games that amused us as children the first faint traces of the combinations that make us laugh as grown-up persons."… "Above all, we are too apt to ignore the childish element, so to speak, latent in most of our joyful emotions" (p. 67). As we have now traced wit to that childish playing with words and thoughts which is prohibited by the rational critic, we must be tempted to trace also these infantile roots of the comic, conjectured by Bergson.

As a matter of fact we meet a whole series of conditions which seem most promising, when we examine the relation of the comic to the child. The child itself does not by any means seem comic to us, although its character fulfills all conditions which, in comparison to our own, would

result in a comic difference. Thus we see the immoderate expenditure of motion as well as the slight psychic expenditure, the control of the psychic activities through bodily functions, and other features. The child gives us a comic impression only when it does not behave as a child but as an earnest grown-up, and even then it affects us only in the same manner as other persons in disguise; but as long as it retains the nature of the child our perception of it furnishes us a pure pleasure, which perhaps recalls the comic. We call it naïve in so far as it displays to us the absence of inhibitions, and we call naïve-comic those of its utterances which in another we would have considered obscene or witty.

On the other hand the child lacks all feeling for the comic. This sentence seems to say no more than that this comic feeling, like many others, first makes its appearance in the course of psychic development; and that would by no means be remarkable, especially since we must admit that it shows itself distinctly even during years which must be accredited to childhood. Nevertheless it can be demonstrated that the assertion that the child lacks feeling for the comic has a deeper meaning than one would suppose. In the first place it will readily be seen that it cannot be different, if our conception is correct, that the comic feeling results from a difference of expenditure produced in the effort to understand the other. Let us again take comic motion as an example. The comparison which furnishes the difference reads as follows, when put in conscious formulas: “So he does it,” and: “So I would do it,” or “So I have done it.” But the child lacks the standard contained in the second sentence, it understands simply through imitation; it just does it. Education of the child furnishes it with the standard: “So you shall do it,” and if it now makes use of the same in comparisons, the nearest conclusion is: “He has not done it right, and I can do it better.” In this case it laughs at the other, it laughs at him with a feeling of superiority. There is nothing to prevent us from tracing this laughter also to a difference of expenditure; but according to the analogy with the examples of laughter occurring in us we may conclude that the comic feeling is not experienced by the child when it laughs as an expression of superiority. It is a laughter of pure pleasure. In our own case whenever the judgment of our own superiority occurs we smile rather than laugh, or if we laugh, we are still able to distinguish clearly this conscious realization of our superiority from the comic which makes us laugh.

It is probably correct to say that in many cases which we perceive as “comical” and which we cannot explain, the child laughs out of pure pleasure, whereas the child’s motives are clear and assignable. If, for instance, some one slips on the street and falls, we laugh because this impression — we know not why — is comical. The child laughs in the same case out of a feeling of superiority or out of joy over the calamity of others. It amounts to saying: “You fell, but I did not.” Certain pleasure motives of the child seems to be lost for us grown-ups, but as a substitute for these we perceive under the same conditions the “comic” feeling.

The Infantile and the Comic

If we were permitted to generalize, it would seem very tempting to transfer the desired specific character of the comic into the awakening of the infantile, and to conceive the comic as a regaining of “lost infantile laughing.” One could then say, “I laugh every time over a difference of expenditure between the other and myself, when I discover in the other the child.” Or expressed more precisely, the whole comparison leading to the comic would read as follows:

“He does it this way — I do it differently —

He does it just as I did when I was a child.”

This laughter would thus result every time from the comparison between the ego of the grown-up and the ego of the child. The uncertainty itself of the comic difference, causing now the lesser and now the greater expenditure to appear comical to me, would correspond to the infantile determination; the comic therein is actually always on the side of the infantile.

This is not contradicted by the fact that the child itself as an object of comparison does not make a comic impression on me but a purely pleasurable one, nor by the fact that this comparison with the infantile produces a comic effect only when any other use of the difference is avoided. For the conditions of the discharge come thereby into consideration. Everything that confines a psychic process in an association of ideas works against the discharge of the surplus occupation of energy and directs the same to other utilization; whatever isolates a psychic act favors the discharge. By consciously focussing on the child as the person of comparison, the discharge necessary for the production of comic pleasure therefore becomes impossible; only in foreconscious energetic

states is there a similar approach to the isolation which we may moreover also ascribe to the psychic processes in the child. The addition to the comparison: “Thus I have also done it as a child,” from which the comic effect would emanate, could come into consideration for the average difference only when no other association could obtain control over the freed surplus.

If we still continue with our attempt to find the nature of the comic in the foreconscious association of the infantile, we have to go a step further than Bergson and admit that the comparison resulting in the comic need not necessarily awake old childish pleasure and play, but that it is enough if it touches the childish nature in general, perhaps even childish pain. Herein we deviate from Bergson, but remain consistent with ourselves, when we connect the comic pleasure not with remembered pleasure but always with a comparison. This is possible, for cases of the first kind comprise in a measure those which are regularly and irresistibly comic. Let us now draw up the scheme of the comic possibilities instanced above. We stated that the comic difference would be found either

(a) through a comparison between the other and one’s self, or (b) through a comparison altogether within the other, or (c) through a comparison altogether within one’s self.

In the first case the other would appear to me as a child, in the second he would put himself on the level of a child, and in the third I would find the child in myself. To the first class belong the comic of movement and of forms, of psychic activity and of character. The infantile corresponding to it would be the motion-impulse and the inferior mental and moral development of the child, so that the fool would perhaps become comical to me by reminding me of a lazy child, and the bad person by reminding me of a naughty child. The only time one might speak of a childish pleasure lost to grown-ups would be where the child’s own motion pleasure came into consideration.

The second case, in which the comic altogether depends on identification with the other, comprises numerous possibilities such as the comic situation, exaggeration (caricature), imitation, degradation, and unmasking. It is under this head that the presentation of infantile viewpoints mostly take place. For the comic situation is largely based on embarrassment, in which we feel again the helplessness of the child. The worst of these embarrassments, the disturbance of other activities through

the imperative demands of natural wants, corresponds to the child's lack of control of the physical functions. Where the comic situation acts through repetitions it is based on the pleasure of constant repetition peculiar to the child (asking questions, telling stories), through which it makes itself a nuisance to grown-ups. Exaggeration, which also affords pleasure even to the grown-up in so far as it is justified by his reason, corresponds to the characteristic want of moderation in the child, and its ignorance of all quantitative relations which it later really learns to know as qualitative. To keep within bounds, to practice moderation even in permissible feelings is a late fruit of education, and is gained through opposing inhibitions of the psychic activity acquired in the same association. Wherever this association is weakened as in the unconscious of dreams and in the monoideation of the psychoneuroses, the want of moderation of the child again makes its appearance.

The understanding of comic imitation has caused us many difficulties so long as we left out of consideration the infantile factor. But imitation is the child's best art and is the impelling motive of most of its playing. The child's ambition is not so much to distinguish himself among his equals as to imitate the big fellows. The relation of the child to the grown-up determines also the comic of degradation, which corresponds to the lowering of the grown-up in the life of the child. Few things can afford the child greater pleasure than when the grown-up lowers himself to its level, disregards his superiority, and plays with the child as its equal. The alleviation which furnishes the child pure pleasure is a debasement used by the adult as a means of making things comic and as a source of comic pleasure. As for unmasking we know that it is based on degradation.

The infantile determination of the third case, the comic of expectation, presents most of the difficulties; this really explains why those authors who put this case to the foreground in their conception of the comic, found no occasion to consider the infantile factor in their studies of the comic. The comic of expectation is farthest from the child's thoughts, the ability to understand this is the latest quality to appear in him. Most of those cases which produce a comic effect in the grown-up are probably felt by the child as a disappointment. One can refer, however, to the blissful expectation and gullibility of the child in order to understand why one considers himself as comical "as a child," when he succumbs to comic disappointment.

If the preceding remarks produce a certain probability that the comic feeling may be translated into the thought; everything is comic that does not fit the grown-up, I still do not feel bold enough, — in view of my whole position to the problem of the comic — to defend this last proposition with the same earnestness as those that I formulated before. I am unable to decide whether the lowering to the level of the child is only a special case of comic degradation, or whether everything comical fundamentally depends on the degradation to the level of the child. [15]

Humor

An examination of the comic, however superficial it may be, would be most incomplete if it did not devote at least a few remarks to the consideration of *humor.* There is so little doubt as to the essential relationship between the two that a tentative explanation of the comic must furnish at least one component for the understanding of humor. It does not matter how much appropriate and important material was presented as an appreciation of humor, which, as one of the highest psychic functions, enjoys the special favor of thinkers, we still cannot elude the temptation to express its essence through an approach to the formulæ given for wit and the comic.

We have heard that the release of painful emotions is the strongest hindrance to the comic effect. Just as aimless motion causes harm, stupidity mischief, and disappointment pain; — the possibility of a comic effect eventually ends, at least for him who cannot defend himself against such pain, who is himself affected by it or must participate in it, whereas the disinterested party shows by his behavior that the situation of the case in question contains everything necessary to produce a comic effect. Humor is thus a means to gain pleasure despite the painful affects which disturb it; it acts as a substitute for this affective development, and takes its place. If we are in a situation which tempts us to liberate painful affects according to our habits, and motives then urge us to suppress these affects *statu nascendi,* we have the conditions for humor. In the cases just cited the person affected by misfortune, pain, etc., could obtain humoristic pleasure while the disinterested party laughs over the comic pleasure. We can only say that the pleasure of humor results at the cost of this discontinued liberation of affect; it originates through the *economized expenditure of affect.*

The Economy in Expenditure of Affect

Humor is the most self-sufficient of the forms of the comic; its process consummating itself in one single person and the participation of another adds nothing new to it. I can enjoy the pleasure of humor originating in myself without feeling the necessity of imparting it to another. It is not easy to tell what happens during the production of humoristic pleasure in a person; but one gains a certain insight by investigating these cases of humor which have emanated from persons with whom we have entered into a sympathetic understanding. By sympathetically understanding the humoristic person in these cases one gets the same pleasure. The coarsest form of humor, the so-called humor of the gallows or grim-humor (*Galgenhumor*), may enlighten us in this regard. The rogue, on being led to execution on Monday, remarked: “Yes, this week is beginning well.” This is really a witticism, as the remark is quite appropriate in itself, on the other hand it is displaced in the most nonsensical fashion, as there can be no further happening for him this week. But it required humor to make such wit, that is, to overlook what distinguished the beginning of this week from other weeks, and to deny the difference which could give rise to motives for very particular emotional feelings. The case is the same when on the way to the gallows he requests a neckerchief for his bare neck, in order to guard against taking cold, a precaution which would be quite praiseworthy under different circumstances, but becomes exceedingly superfluous and indifferent in view of the impending fate of this same neck. We must say that there is something like greatness of soul in this *blague,* in this clinging to his usual nature and in deviating from that which would overthrow and drive this nature into despair. This form of grandeur of humor thus appears unmistakably in cases in which our admiration is not inhibited by the circumstances of the humoristic person.

In Victor Hugo’s *Ernani* the bandit who entered into a conspiracy against his king, Charles I, of Spain, (Charles V, as the German Emperor), falls into the hands of his most powerful enemy; he foresees his fate; as one convicted of high treason his head will fall. But this prospect does not deter him from introducing himself as a hereditary Grandee of Spain and from declaring that he has no intention of waiving any prerogative belonging to such personage. A Grandee of Spain could appear before his royal master with his head covered. Well:

“Nos têtes ont le droit
De tomber couvertes devant de toi.” [16]

This is excellent humor and if we do not laugh on hearing it, it is because our admiration covers the humoristic pleasure. In the case of the rogue who did not wish to take cold on the way to the gallows we roar with laughter. The situation which should have driven this criminal to despair, might have evoked in us intense pity, but this pity is inhibited because we understand that he who is most concerned is quite indifferent to the situation. As a result of this understanding the expenditure for pity, which was already prepared in us, became inapplicable and we laughed it off. The indifference of the rogue, which we notice has cost him a great expenditure of psychic labor, infects us as it were.

Economy of sympathy is one of the most frequent sources of humoristic pleasure. Mark Twain’s humor usually follows this mechanism. When he tells us about the life of his brother, how, as an employee in a large road-building enterprise, he was hurled into the air through a premature explosion of a blast, to come to earth again far from the place where he was working, feelings of sympathy for this unfortunate are invariably aroused in us. We should like to inquire whether he sustained no injury in this accident; but the continuation of the story that the brother lost a half-day’s pay for being away from the place he worked diverts us entirely from sympathy and makes us almost as hard-hearted as that employer, and just as indifferent to the possible injury to the victim’s health. Another time Mark Twain presents us his pedigree, which he traces back almost as far back as one of the companions of Columbus. But after describing the character of this ancestor, whose entire possessions consisted of several pieces of linen each bearing a different mark, we cannot help laughing at the expense of the stored-up piety, a piety which characterized our frame of mind at the beginning of this family history. The mechanism of humoristic pleasure is not disturbed by our knowing that this family history is a fictitious one, and that this fiction serves a satirical tendency to expose the embellishments which result in imparting such pedigrees to others; it is just as independent of the conditions of reality as the manufactured comic. Another of Mark Twain’s stories relates how his brother constructed for himself subterranean quarters into which he brought a bed, a table, and a lamp, and that as a roof he used a large piece of sail-cloth with a hole through the centre; how during the night

after the room was completed, a cow being driven home fell through the opening in the ceiling on to the table and extinguished the lamp; how his brother helped patiently to hoist the animal out and to rearrange everything; how he did the same thing when the same disturbance was repeated the following night; and then every succeeding night; such a story becomes comical through repetition. But Mark Twain closes with the information that in the forty-sixth night when the cow again fell through, his brother finally remarked that the thing was beginning to grow monotonous; and here we can no longer restrain our humoristic pleasure, for we had long expected to hear how the brother would express his anger over this chronic *malheur.* The slight humor which we draw from our own life we usually produce at the expense of anger instead of irritating ourselves. [17]

Forms of Humor

The forms of humor are extraordinarily varied according to the nature of the emotional feelings which are economized in favor of humor, as sympathy, anger, pain, compassion, etc. And this series seems incomplete because the sphere of humor experiences a constant enlargement, as often as an artist or writer succeeds in mastering humoristically the, as yet, unconquered emotional feelings and in making them, through artifices similar to those in the above example, a source of humoristic pleasure. Thus the artists of *Simplicissimus* have worked wonders in gaining humor at the expense of fear and disgust. The manifestations of humor are above all determined by two peculiarities, which are connected with the conditions of its origin. In the first place, humor may appear fused with wit or any other form of the comic; whereby it is entrusted with the task of removing a possible emotional development which would form a hindrance to the pleasurable effect. Secondly, it can entirely set aside this emotional development or only partially, which is really the more frequent case, because the simpler function and the different forms of “broken” [18] humor, results in that humor which smiles under its tears. It withdraws from the affect a part of its energy and gives instead the accompanying humoristic sound.

As may be noticed by former examples the humoristic pleasure gained by entering into sympathy with a thing results from a special technique resembling displacement through which the liberation of affect held ready

is disappointed and the energy occupation is deflected to other, and, not often, to secondary matters. This does not help us, however, to understand the process by which the displacement from the development of affect proceeds in the humoristic person himself. We see that the recipient intimates the producer of the humor in his psychic processes, but we discover nothing thereby concerning the forces which make this process possible in the latter.

We can only say, when, for example, somebody succeeds in paying no heed to a painful affect because he holds before himself the greatness of the world's interest as a contrast to his own smallness, that we see in this no function of humor but one of philosophic thinking, and we gain no pleasure even if we put ourselves into his train of thought. The humoristic displacement is therefore just as impossible in the light of conscious attention as is the comic comparison; like the latter it is connected with the condition to remain in the foreconscious — that is to say, to remain automatic.

One reaches some solution of humoristic displacement if one examines it in the light of a defense process. The defense processes are the psychic correlates of the flight reflex and follow the task of guarding against the origin of pain from inner sources; in fulfilling this task they serve the psychic function as an automatic adjustment, which finally proves harmful and therefore must be subjected to the control of the conscious thinking. A definite form of this defense, the failure of repression, I have demonstrated as the effective mechanism in the origin of the psychoneuroses. Humor can now be conceived as the loftiest variant of this defense activity. It disdains to withdraw from conscious attention the ideas which are connected with the painful affect, as repression does, and thus it overcomes the defense automatism. It brings this about by finding the means to withdraw the energy resulting from the liberation of pain which is held in readiness and through discharge changes the same into pleasure. It is even credible that it is again the connection with the infantile that puts at humor's disposal the means for this function. Only in childhood did we experience intensively painful affects over which to-day as grown-ups we would laugh; just as a humorist laughs over his present painful affects. The elevation of his ego, of which humoristic displacement gives evidence, — the translation of which would read: I am too big to have these causes affect me painfully — he could find in the comparison

of his present ego with his infantile ego. This conception is to some extent confirmed by the rôle which falls to the infantile in the neurotic processes of repression.

The Relation of Humor to Wit and Comic

On the whole humor is closer to the comic than wit. Like the former its psychic localization is in the foreconscious, whereas wit, as we had to assume, is formed as a compromise between the unconscious and the foreconscious. On the other hand, humor has no share in the peculiar nature in which wit and the comic meet, a peculiarity which perhaps we have not hitherto emphasized strongly enough. It is a condition for the origin of the comic that we be induced to apply — either *simultaneously* or in rapid succession — to the same thought function two different modes of ideas, between which the "comparison" then takes place and thus forms the comic difference. Such differences originate between the expenditure of the stranger and one's own, between the usual expenditure and the emergency expenditure, between an anticipated expenditure and one which has already occurred. [19]

The difference between two forms of conception resulting simultaneously, which work with different expenditures, comes into consideration in wit, in respect to the hearer. The one of these two conceptions, by taking the hints contained in the witticism, follows the train of thought through the unconscious, while the other conception remains on the surface and presents the witticism like any wording from the foreconscious which has become conscious. Perhaps it would not be considered an unjustified statement if we should refer the pleasure of the witticism heard to the difference between these two forms of presentation.

Concerning wit we here repeat our former statement concerning its Janus-like double-facedness, a simile we used when the relation between wit and the comic still appeared to us unsettled. [20]

The character thus put into the foreground becomes indistinct when we deal with humor. To be sure, we feel the humoristic pleasure where an emotional feeling is evaded, which we might have expected as a pleasure usually belonging to the situation; and in so far humor really falls under the broadened conception of the comic of expectation. But in humor it is no longer a question of two different kinds of presentations having the same content; the fact that the situation comes under the domination of a

painful emotional feeling which should have been avoided, puts an end to possible comparison with the nature in the comic and in wit. The humoristic displacement is really a case of that different kind of utilization of a freed expenditure which proved to be so dangerous for the comic effect.

Formulæ for Wit, Comic, and Humor

Now, that we have reduced the mechanism of humoristic pleasure to a formula analogous to the formula of comic pleasure and of wit, we are at the end of our task. It has seemed to us that the pleasure of wit originates from an *economy of expenditure in inhibition*, of the comic from an *economy of expenditure in thought*, and of humor from an *economy of expenditure in feeling.* All three activities of our psychic apparatus derive pleasure from economy. They all strive to bring back from the psychic activity a pleasure which has really been lost in the development of this activity. For the euphoria which we are thus striving to obtain is nothing but the state of a bygone time in which we were wont to defray our psychic work with slight expenditure. It is the state of our childhood in which we did not know the comic, were incapable of wit, and did not need humor to make us happy.

ENDNOTES.

[1] Given by Translator.

[2] I have everywhere identified the naïve with the naïve-comic, a practice which is certainly not permissible in all cases. But it is sufficient for our purposes to study the characteristics of the naïve as exhibited by the “naïve joke” and the “naïve obscenity.” It is our intention to proceed from here with the investigation of the nature of the comic.

[3] Also Bergson (*Laughter,* An essay on the Meaning of the Comic, translated by Brereton and Rothwell, The Macmillan Co., 1914) rejects with sound arguments this sort of explanation of comic pleasure, which has unmistakably been influenced by the effort to create an analogy to the laughing of a person tickled. The explanation of comic pleasure by Lipps which might, in connection with his conception of the comic, be represented as an “unexpected trifle,” is of an entirely different nature.

[4] The recollection of this innervation expenditure will remain the essential part of the idea of this motion, and there will always be methods of thought in my psychic life in which the idea will be represented by nothing else than this expenditure. In other connections a substitute for this

element may possibly be put in the form of other ideas, for instance the visual idea of the object of the motion, or it may be put in the form of the word-idea; and in certain types of abstract thought a sign instead of the full content itself may suffice.

[5] "What one has not in his head," as the saying goes, "he must have in his legs."

[6] The problem has been greatly confused by the general conditions determining the comic, whereby the comic pleasure is seen to have its source now in a too-muchness and now in a not-enoughness.

[7] Degradation: A. Bain (*The Emotions and the Will,* 2nd Ed., 1865) states: "The occasion of the ludicrous is the degradation of some person of interest possessing dignity, in circumstances that excite no other strong emotion" (p. 248).

[8] "Thus every conscious and clever evocation of the comic is called wit, be it the comic of views or situations. Naturally we cannot use this view of wit here." Lipps, l. c., p. 78.

[9] At the most this is inserted by the dreamer as an explanation.

[10] l. c., p. 294.

[11] "Trente et quarante" is a gambling game.

[12] Bergson, l. c., p. 29.

[13] Sixth Ed., Berlin, 1891.

[14] "You may well laugh, that no longer concerns you."

[15] That comic pleasure has its source in the "quantitative contrast," in the comparison of big and small, which ultimately also expresses the essential relation of the child to the grown-up, would indeed be a peculiar coincidence if the comic had nothing else to do with the infantile.

[16] "Our heads have the right to fall covered before thee."

[17] The excellent humoristic effect of a character like that of the fat knight, Sir John Falstaff, is based on economized contempt and indignation. To be sure we recognize in him the unworthy glutton and fashionably dressed swindler, but our condemnation is disarmed through a whole series of factors. We understand that he knows himself to be just as we estimate him; he impresses us through his wit; and besides that, his physical deformity produces a contact-effect in favor of a comic conception of his personality instead of a serious one; as if our demands for morality and honor must recoil from such a big stomach. His activities are altogether harmless and are almost excused by the comic lowness of those he deceives. We admit that the poor devil has a right to live and enjoy himself like any one else, and we almost pity him because in the principal situation we find him a puppet in the hands of one much his superior. It is for this

reason that we cannot bear him any grudge and turn all we economize in him in indignation into comic pleasure which he otherwise provides. Sir John's own humor really emanates from the superiority of an ego which neither his physical nor his moral defects can rob of its joviality and security.

On the other hand the courageous knight Don Quixote de la Mancha is a figure who possesses no humor, and in his seriousness furnishes us a pleasure which can be called humoristic although its mechanism shows a decided deviation from that of humor. Originally Don Quixote is a purely comic figure, a big child whose fancies from his books on knighthood have gone to his head. It is known that at first the poet wanted to show only that phase of his character, and that the creation gradually outgrew the author's original intentions. But after the poet endowed this ludicrous person with the profoundest wisdom and noblest aims and made him the symbolic representation of an idealism, a man who believed in the realization of his aims, who took duties seriously and promises literally, he ceased to be a comic personality. Like humoristic pleasure which results from a prevention of emotional feelings it originates here through the disturbance of comic pleasure. However, in these examples we already depart perceptibly from the simple cases of humor.

[18] A term which is used in quite a different sense in the *Aesthetik* of Theo. Vischer.

[19] If one does not hesitate to do some violence to the conception of expectation, one may ascribe — according to the process of Lipps — a very large sphere of the comic to the comic of expectation; but probably the most original cases of the comic which result through a comparison of a strange expenditure with one's own will fit least into this conception.

[20] The characteristic of the "double face" naturally did not escape the authors. Melinaud, from whom I borrowed the above expression, conceives the condition for laughing in the following formula: "Ce qui fait rire c'est qui est à la fois, d'un coté, absurde et de l'autre, familier" ("Pourquoi rit-on?" *Revue de deux mondes,* February, 1895). This formula fits in better with wit than with the comic, but it really does not altogether cover the former. Bergson (l. c., p. 96) defines the comic situation by the "reciprocal interference of series," and states: "A situation is invariably comic when it belongs simultaneously to two altogether independent series of events and is capable of being interpreted in two entirely different meanings at the same time." According to Lipps the comic is "the greatness and smallness of the same."

DELUSIONS AND DREAMS IN JENSEN'S GRADIVA

Translated by Helen M. Downey

Written in 1907, *Delusion and Dream in Jensen's Gradiva* subjects the novel *Gradiva* by Wilhelm Jensen, and especially its protagonist, to psychoanalysis. The novel concerns the young archaeologist, Norbert Hanold, who is fascinated by a female figure in an antique bas-relief and gives her the name 'Gradiva' after Mars Gradivus, the Roman god of war walking into battle; later, not quite certain whether he is awake or dreaming, he meets her in the ruins of Pompeii. Freud believed the novel provided a prime example of 'something which might be called "cure by seduction" or "cure by love"', as well as evidence 'that the Oedipus complex is still active in normal adults, too'.

Post-Freudians vary widely on whether Hanold suffers from neurosis or psychosis, some emphasising 'the way Freud offers psychoanalysts a model which shows "how to address the 'mad' part of our patients without neglecting the rest of their person"'. The Poststructuralist philosopher Jacques Derrida references Freud's use of Jensen's *Gradiva* in his own book-length essay *Archive Fever: A Freudian Impression* (1995).

PART II. DELUSION AND DREAM

Wilhelm Jensen (1837-1911)

PREFACE

To Dr. G. Stanley Hall, President of Clark University, who first called to my attention the charm of *Gradiva*, by Wilhelm Jensen, and suggested the possibility of the translation and publication combined with the translation of Freud's commentary, I am deeply grateful for his kindly interest and effort in connection with the publication of the book, and his assistance with the technical terms of psychopathology.

In this connection I am also indebted to Dr. Smith Ely Jelliffe, who gave many helpful suggestions as a result of his thorough reading of the manuscript of the commentary.

I wish also to express my profound appreciation to my friend, Miss M. Evelyn Fitzsimmons, for her generous help with the original manuscript and other valuable comments offered while she was reading the entire proof.

HELEN M. DOWNEY.

Worcester, Mass.

INTRODUCTION

Jensen's brilliant and unique story of *Gradiva* has not only literary merit of very high order, but may be said to open up a new field for romance. It is the story of a young archæologist who suffered a very characteristic mental disturbance and was gradually but effectively cured by a kind of native psychotherapeutic instinct, which probably inheres in all of us, but which in this case was found in the girl he formerly loved but had forgotten, and who restored at the same time his health and his old affection for her.

Perhaps the most extraordinary thing about the work is that the author knew nothing of psychotherapy as such, but wrought his way through the labyrinth of mechanisms that he in a sense rediscovered and set to work, so that it needed only the application of technical terms to make this romance at the same time a pretty good key to the whole domain of psychoanalysis. In a sense it is a dream-story, but no single dream ever began to be so true to the typical nature of dreams; it is a clinical picture, but I can think of no clinical picture that had its natural human interest so enhanced by a moving romance. *Gradiva* might be an introduction to psychoanalysis, and is better than anything else we can think of to popularize it.

It might be added that while this romance has been more thoroughly analysed than any other, and that by Freud himself, it is really only one of many which in the literature of the subject have been used to show forth the mysterious ways of the unconscious. It indicates that psychoanalysis has a future in literary criticism, if not that all art and artists have, from the beginning, more or less anticipated as they now illustrate it.

The translator is thoroughly competent and has done her work with painstaking conscientiousness, and she has had the great advantage of having it revised, especially with reference to the translation of technical terms from the German, by no less an eminent expert in psychotherapy than Dr. Smith Ely Jelliffe.

G. STANLEY HALL.

PART I. GRADIVA

A POMPEIIAN FANCY

BY

WILHELM JENSEN

GRADIVA

On a visit to one of the great antique collections of Rome, Norbert Hanold had discovered a bas-relief which was exceptionally attractive to him, so he was much pleased, after his return to Germany, to be able to get a splendid plaster-cast of it. This had now been hanging for some years on one of the walls of his work-room, all the other walls of which were lined with bookcases. Here it had the advantage of a position with the right light exposure, on a wall visited, though but briefly, by the evening sun. About one-third life-size, the bas-relief represented a complete female figure in the act of walking; she was still young, but no longer in childhood and, on the other hand, apparently not a woman, but a Roman virgin about in her twentieth year. In no way did she remind one of the numerous extant bas-reliefs of a Venus, a Diana, or other Olympian goddess, and equally little of a Psyche or nymph. In her was embodied something humanly commonplace — not in a bad sense — to a degree a sense of present time, as if the artist, instead of making a pencil sketch of her on a sheet of paper, as is done in our day, had fixed her in a clay model quickly, from life, as she passed on the street, a tall, slight figure, whose soft, wavy hair a folded kerchief almost completely bound; her rather slender face was not at all dazzling; and the desire to produce such effect was obviously equally foreign to her; in the delicately formed features was expressed a nonchalant equanimity in regard to what was occurring about her; her eye, which gazed calmly ahead, bespoke absolutely unimpaired powers of vision and thoughts quietly withdrawn. So the young woman was fascinating, not at all because of plastic beauty of form, but because she possessed something rare in antique sculpture, a realistic, simple, maidenly grace which gave the impression of imparting life to the relief. This was effected chiefly by the movement represented in the picture.

With her head bent forward a little, she held slightly raised in her left hand, so that her sandalled feet became visible, her garment which fell in exceedingly voluminous folds from her throat to her ankles. The left foot had advanced, and the right, about to follow, touched the ground only lightly with the tips of the toes, while the sole and heel were raised almost vertically. This movement produced a double impression of exceptional agility and of confident composure, and the flight-like poise, combined with a firm step, lent her the peculiar grace.

Where had she walked thus and whither was she going? Doctor Norbert Hanold, docent of archæology, really found in the relief nothing noteworthy for his science. It was not a plastic production of great art of the antique times, but was essentially a Roman *genre* production, and he could not explain what quality in it had aroused his attention; he knew only that he had been attracted by something and this effect of the first view had remained unchanged since then. In order to bestow a name upon the piece of sculpture, he had called it to himself Gradiva, “the girl splendid in walking.” That was an epithet applied by the ancient poets solely to Mars Gradivus, the war-god going out to battle, yet to Norbert it seemed the most appropriate designation for the bearing and movement of the young girl, or, according to the expression of our day, of the young lady, for obviously she did not belong to a lower class but was the daughter of a nobleman, or at any rate was of honourable family. Perhaps — her appearance brought the idea to his mind involuntarily — she might be of the family of a patrician ædile whose office was connected with the worship of Ceres, and she was on her way to the temple of the goddess on some errand.

Yet it was contrary to the young archæologist’s feeling to put her in the frame of great, noisy, cosmopolitan Rome. To his mind, her calm, quiet manner did not belong in this complex machine where no one heeded another, but she belonged rather in a smaller place where every one knew her, and, stopping to glance after her, said to a companion, “That is Gradiva” — her real name Norbert could not supply— “the daughter of ——— , she walks more beautifully than any other girl in our city.”

As if he had heard it thus with his own ears, the idea had become firmly rooted in his mind, where another supposition had developed almost into a conviction. On his Italian journey, he had spent several weeks in Pompeii studying the ruins; and in Germany, the idea had suddenly come to him

one day that the girl depicted by the relief was walking there, somewhere, on the peculiar stepping-stones which have been excavated; these had made a dry crossing possible in rainy weather, but had afforded passage for chariot-wheels. Thus he saw her putting one foot across the interstice while the other was about to follow, and as he contemplated the girl, her immediate and more remote environment rose before his imagination like an actuality. It created for him, with the aid of his knowledge of antiquity, the vista of a long street, among the houses of which were many temples and porticoes. Different kinds of business and trades, stalls, work-shops, taverns came into view; bakers had their breads on display; earthenware jugs, set into marble counters, offered everything requisite for household and kitchen; at the street corner sat a woman offering vegetables and fruit for sale from baskets; from a half-dozen large walnuts she had removed half of the shell to show the meat, fresh and sound, as a temptation for purchasers. Wherever the eye turned, it fell upon lively colours, gaily painted wall surfaces, pillars with red and yellow capitals; everything reflected the glitter and glare of the dazzling noonday sun. Farther off on a high base rose a gleaming, white statue, above which, in the distance, half veiled by the tremulous vibrations of the hot air, loomed Mount Vesuvius, not yet in its present cone shape and brown aridity, but covered to its furrowed, rocky peak with glistening verdure. In the street only a few people moved about, seeking shade wherever possible, for the scorching heat of the summer noon hour paralysed the usually bustling activities. There Gradiva walked over the stepping-stones and scared away from them a shimmering, golden-green lizard.

Thus the picture stood vividly before Norbert Hanold’s eyes, but from daily contemplation of her head, another new conjecture had gradually arisen. The cut of her features seemed to him, more and more, not Roman or Latin, but Greek, so that her Hellenic ancestry gradually became for him a certainty. The ancient settlement of all southern Italy by Greeks offered sufficient ground for that, and more ideas pleasantly associated with the settlers developed. Then the young “domina” had perhaps spoken Greek in her parental home, and had grown up fostered by Greek culture. Upon closer consideration he found this also confirmed by the expression of the face, for quite decidedly wisdom and a delicate spirituality lay hidden beneath her modesty.

These conjectures or discoveries could, however, establish no real archæological interest in the little relief, and Norbert was well aware that something else, which no doubt might be under the head of science, made him return to frequent contemplation of the likeness. For him it was a question of critical judgment as to whether the artist had reproduced Gradiva's manner of walking from life. About that he could not become absolutely certain, and his rich collection of copies of antique plastic works did not help him in this matter. The nearly vertical position of the right foot seemed exaggerated; in all experiments which he himself made, the movement left his rising foot always in a much less upright position; mathematically formulated, his stood, during the brief moment of lingering, at an angle of only forty-five degrees from the ground, and this seemed to him natural for the mechanics of walking, because it served the purpose best. Once he used the presence of a young anatomist friend as an opportunity for raising the question, but the latter was not able to deliver a definite decision, as he had made no observations in this connection. He confirmed the experience of his friend, as agreeing with his own, but could not say whether a woman's manner of walking was different from that of a man, and the question remained unanswered.

In spite of this, the discussion had not been without profit, for it suggested something that had not formerly occurred to him; namely, observation from life for the purpose of enlightenment on the matter. That forced him, to be sure, to a mode of action utterly foreign to him; women had formerly been for him only a conception in marble or bronze, and he had never given his feminine contemporaries the least consideration; but his desire for knowledge transported him into a scientific passion in which he surrendered himself to the peculiar investigation which he recognized as necessary. This was hindered by many difficulties in the human throng of the large city, and results of the research were to be hoped for only in the less frequented streets. Yet, even there, long skirts generally made the mode of walking undiscernible, for almost no one but housemaids wore short skirts and they, with the exception of a few, because of their heavy shoes could not well be considered in solving the question. In spite of this he steadfastly continued his survey in dry, as well as in wet weather; he perceived that the latter promised the quickest results, for it caused the ladies to raise their skirts. To many ladies, his searching glances directed at their feet must have inevitably been quite noticeable; sometimes a

displeased expression of the lady observed showed that she considered his demeanour a mark of boldness or ill-breeding; sometimes, as he was a young man of very captivating appearance, the opposite, a bit of encouragement, was expressed by a pair of eyes. Yet one was as incomprehensible to him as the other. Gradually his perseverance resulted in the collection of a considerable number of observations, which brought to his attention many differences. Some walked slowly, some fast, some ponderously, some buoyantly. Many let their soles merely glide over the ground; not many raised them more obliquely to a smarter position. Among all, however, not a single one presented to view Gradiva's manner of walking. That filled him with satisfaction that he had not been mistaken in his archæological judgment of the relief. On the other hand, however, his observations caused him annoyance, for he found the vertical position of the lingering foot beautiful, and regretted that it had been created by the imagination or arbitrary act of the sculptor and did not correspond to reality.

Soon after his pedestrian investigations had yielded him this knowledge, he had, one night, a dream which caused him great anguish of mind. In it he was in old Pompeii, and on the twenty-fourth of August of the year 79, which witnessed the eruption of Vesuvius. The heavens held the doomed city wrapped in a black mantle of smoke; only here and there the flaring masses of flame from the crater made distinguishable, through a rift, something steeped in blood-red light; all the inhabitants, either individually or in confused crowd, stunned out of their senses by the unusual horror, sought safety in flight; the pebbles and the rain of ashes fell down on Norbert also, but, after the strange manner of dreams, they did not hurt him, and in the same way, he smelled the deadly sulphur fumes of the air without having his breathing impeded by them. As he stood thus at the edge of the Forum near the Jupiter temple, he suddenly saw Gradiva a short distance in front of him. Until then no thought of her presence there had moved him, but now suddenly it seemed natural to him, as she was, of course, a Pompeiian girl, that she was living in her native city and, without his having any suspicion of it, was his contemporary. He recognized her at first glance; the stone model of her was splendidly striking in every detail, even to her gait; involuntarily he designated this as "lente festinans." So with buoyant composure and the calm unmindfulness of her surroundings peculiar to her, she walked across the

flagstones of the Forum to the Temple of Apollo. She seemed not to notice the impending fate of the city, but to be given up to her thoughts; on that account he also forgot the frightful occurrence, for at least a few moments, and because of a feeling that the living reality would quickly disappear from him again, he tried to impress it accurately on his mind. Then, however, he became suddenly aware that if she did not quickly save herself, she must perish in the general destruction, and violent fear forced from him a cry of warning. She heard it, too, for her head turned toward him so that her face now appeared for a moment in full view, yet with an utterly uncomprehending expression; and, without paying any more attention to him, she continued in the same direction as before. At the same time, her face became paler as if it were changing to white marble; she stepped up to the portico of the Temple, and then, between the pillars, she sat down on a step and slowly laid her head upon it. Now the pebbles were falling in such masses that they condensed into a completely opaque curtain; hastening quickly after her, however, he found his way to the place where she had disappeared from his view, and there she lay, protected by the projecting roof, stretched out on the broad step, as if for sleep, but no longer breathing, apparently stifled by the sulphur fumes. From Vesuvius the red glow flared over her countenance, which, with closed eyes, was exactly like that of a beautiful statue. No fear nor distortion was apparent, but a strange equanimity, calmly submitting to the inevitable, was manifest in her features. Yet they quickly became more indistinct as the wind drove to the place the rain of ashes, which spread over them, first like a grey gauze veil, then extinguished the last glimpse of her face, and soon, like a Northern winter snowfall, buried the whole figure under a smooth cover. Outside, the pillars of the Temple of Apollo rose, now, however, only half of them, for the grey fall of ashes heaped itself likewise against them.

When Norbert Hanold awoke, he still heard the confused cries of the Pompeiians who were seeking safety, and the dully resounding boom of the surf of the turbulent sea. Then he came to his senses; the sun cast a golden gleam of light across his bed; it was an April morning and outside sounded the various noises of the city, cries of venders, and the rumbling of vehicles. Yet the dream picture still stood most distinctly in every detail before his open eyes, and some time was necessary before he could get rid of a feeling that he had really been present at the destruction on the bay of

Naples, that night nearly two thousand years ago. While he was dressing, he first became gradually free from it, yet he did not succeed, even by the use of critical thought, in breaking away from the idea that Gradiva had lived in Pompeii and had been buried there in 79. Rather, the former conjecture had now become to him an established certainty, and now the second also was added. With woful feeling he now viewed in his living-room the old relief which had assumed new significance for him. It was, in a way, a tombstone by which the artist had preserved for posterity the likeness of the girl who had so early departed this life. Yet if one looked at her with enlightened understanding, the expression of her whole being left no doubt that, on that fateful night, she had actually lain down to die with just such calm as the dream had showed. An old proverb says that the darlings of the gods are taken from the earth in the full vigour of youth.

Without having yet put on a collar, in morning array, with slippers on his feet, Norbert leaned on the open window and gazed out. The spring, which had finally arrived in the north also, was without, but announced itself in the great quarry of the city only by the blue sky and the soft air, yet a foreboding of it reached the senses, and awoke in remote, sunny places a desire for leaf-green, fragrance and bird song; a breath of it came as far as this place; the market women on the street had their baskets adorned with a few, bright wild flowers, and at an open window, a canary in a cage warbled his song. Norbert felt sorry for the poor fellow for, beneath the clear tone, in spite of the joyful note, he heard the longing for freedom and the open.

Yet the thoughts of the young archæologist dallied but briefly there, for something else had crowded into them. Not until then had he become aware that in the dream he had not noticed exactly whether the living Gradiva had really walked as the piece of sculpture represented her, and as the women of to-day, at any rate, did not walk. That was remarkable because it was the basis of his scientific interest in the relief; on the other hand, it could be explained by his excitement over the danger to her life. He tried, in vain, however, to recall her gait.

Then suddenly something like a thrill passed through him; in the first moment he could not say whence. But then he realized; down in the street, with her back toward him, a female, from figure and dress undoubtedly a young lady, was walking along with easy, elastic step. Her dress, which reached only to her ankles, she held lifted a little in her left hand, and he

saw that in walking the sole of her slender foot, as it followed, rose for a moment vertically on the tips of the toes. It appeared so, but the distance and the fact that he was looking down did not admit of certainty.

Quickly Norbert Hanold was in the street without yet knowing exactly how he had come there. He had, like a boy sliding down a railing, flown like lightning down the steps, and was running down among the carriages, carts and people. The latter directed looks of wonder at him, and from several lips came laughing, half mocking exclamations. He was unaware that these referred to him; his glance was seeking the young lady and he thought that he distinguished her dress a few dozen steps ahead of him, but only the upper part; of the lower half, and of her feet, he could perceive nothing, for they were concealed by the crowd thronging on the sidewalk.

Now an old, comfortable, vegetable woman stretched her hand toward his sleeve, stopped him and said, half grinning, “Say, my dear, you probably drank a little too much last night, and are you looking for your bed here in the street? You would do better to go home and look at yourself in the mirror.”

A burst of laughter from those near by proved it true that he had shown himself in garb not suited to public appearance, and brought him now to realization that he had heedlessly run from his room. That surprised him because he insisted upon conventionality of attire and, forsaking his project, he quickly returned home, apparently, however, with his mind still somewhat confused by the dream and dazed by illusion, for he had perceived that, at the laughter and exclamation, the young lady had turned her head a moment, and he thought he had seen not the face of a stranger, but that of Gradiva looking down upon him.

* * * * *

Because of considerable property, Doctor Norbert Hanold was in the pleasant position of being unhampered master of his own acts and wishes and, upon the appearance of any inclination, of not depending for expert counsel about it on any higher court than his own decision. In this way he differed most favourably from the canary, who could only warble out, without success, his inborn impulse to get out of the cage into the sunny open. Otherwise, however, the young archæologist resembled the latter in many respects. He had not come into the world and grown up in natural

freedom, but already at birth had been hedged in by the grating with which family tradition, by education and predestination, had surrounded him. From his early childhood no doubt had existed in his parents' house that he, as the only son of a university professor and antiquarian, was called upon to preserve, if possible to exalt, by that very activity the glory of his father's name; so this business continuity had always seemed to him the natural task of his future. He had clung loyally to it even after the early deaths of his parents had left him absolutely alone; in connection with his brilliantly passed examination in philology, he had taken the prescribed student trip to Italy and had seen in the original a number of old works of art whose imitations, only, had formerly been accessible to him. Nothing more instructive for him than the collections of Florence, Rome, Naples could be offered anywhere; he could furnish evidence that the period of his stay there had been used excellently for the enrichment of his knowledge, and he had returned home fully satisfied to devote himself with the new acquisitions to his science. That besides these objects from the distant past, the present still existed round about him, he felt only in the most shadowy way; for his feelings marble and bronze were not dead, but rather the only really vital thing which expressed the purpose and value of human life; and so he sat in the midst of his walls, books and pictures, with no need of any other intercourse, but whenever possible avoiding the latter as an empty squandering of time and only very reluctantly submitting occasionally to an inevitable party, attendance at which was required by the connections handed down from his parents. Yet it was known that at such gatherings he was present without eyes or ears for his surroundings, and as soon as it was any way permissible, he always took his leave, under some pretext, at the end of the lunch or dinner, and on the street he greeted none of those whom he had sat with at the table. That served, especially with young ladies, to put him in a rather unfavourable light; for upon meeting even a girl with whom he had, by way of exception, spoken a few words, he looked at her without a greeting as at a quite unknown person whom he had never seen. Although perhaps archæology, in itself, might be a rather curious science and although its alloy had effected a remarkable amalgamation with Norbert Hanold's nature, it could not exercise much attraction for others and afforded even him little enjoyment in life according to the usual views of youth. Yet with a perhaps kindly intent Nature had added to his blood, without his knowing of the possession, a

kind of corrective of a thoroughly unscientific sort, an unusually lively imagination which was present not only in dreams, but often in his waking hours, and essentially made his mind not preponderantly adapted to strict research method devoid of interest. From this endowment, however, originated another similarity between him and the canary. The latter was born in captivity, had never known anything else than the cage which confined him in narrow quarters, but he had an inner feeling that something was lacking to him, and sounded from his throat his desire for the unknown. Thus Norbert Hanold understood it, pitied him for it, returned to his room, leaned again from the window and was thereupon moved by a feeling that he, too, lacked a nameless something. Meditation on it, therefore, could be of no use. The indefinite stir of emotion came from the mild, spring air, the sunbeams and the broad expanse with its fragrant breath, and formed a comparison for him; he was likewise sitting in a cage behind a grating. Yet this idea was immediately followed by the palliating one that his position was more advantageous than that of the canary, for he had in his possession wings which were hindered by nothing from flying out into the open at his pleasure.

But that was an idea which developed more upon reflection. Norbert gave himself up for a time to this occupation, yet it was not long before the project of a spring journey assumed definite shape. This he carried out that very day, packed a light valise, and before he went south by the night express, cast at nightfall another regretful departing glance on Gradiva, who, steeped in the last rays of the sun, seemed to step out with more buoyancy than ever over the invisible stepping-stones beneath her feet. Even if the impulse for travel had originated in a nameless feeling, further reflection had, however, granted, as a matter of course, that it must serve a scientific purpose. It had occurred to him that he had neglected to inform himself with accuracy about some important archæological questions in connection with some statues in Rome and, without stopping on the way, he made the journey of a day and a half thither.

* * * * *

Not very many personally experience the beauty of going from Germany to Italy in the spring when one is young, wealthy and independent, for even those endowed with the three latter requirements are not always

accessible to such a feeling for beauty, especially if they (and alas they form the majority) are in couples on the days or weeks after a wedding, for such allow nothing to pass without an extraordinary delight, which is expressed in numerous superlatives; and finally they bring back home, as profit, only what they would have discovered, felt or enjoyed exactly as much by staying there. In the spring such dualists usually swarm over the Alpine passes in exactly opposite direction to the birds of passage. During the whole journey they billed and cooed around Norbert as if they were in a rolling dove-cot, and for the first time in his life he was compelled to observe his fellow beings more closely with eye and ear. Although, from their speech, they were all German country people, his racial identity with them awoke in him no feeling of pride, but rather the opposite one, that he had done reasonably well to bother as little as possible with the *homo sapiens* of Linnæan classification, especially in connection with the feminine half of this species; for the first time he saw also, in his immediate vicinity, people brought together by the mating impulse without his being able to understand what had been the mutual cause. It remained incomprehensible to him why the women had chosen these men, and still more perplexing why the choice of the men had fallen upon these women. Every time he raised his eyes, his glance had to fall on the face of some one of them and it found none which charmed the eye by outer attraction or possessed indication of intellect or good nature. To be sure, he lacked a standard for measuring, for of course one could not compare the women of to-day with the sublime beauty of the old works of art, yet he had a dark suspicion that he was not to blame for this unkind view, but that in all expressions there was something lacking which ordinary life was in duty bound to offer. So he reflected for many hours on the strange impulses of human beings, and came to the conclusion that of all their follies, marriage, at any rate, took the prize as the greatest and most incomprehensible one, and the senseless wedding trips to Italy somehow capped the climax of this buffoonery.

Again, however, he was reminded of the canary that he had left behind in captivity, for he also sat here in a cage, cooped in by the faces of young bridal couples which were as rapturous as vapid, past which his glance could only occasionally stray through the window. Therefore it can be easily explained that the things passing outside before his eyes made other impressions on him than when he had seen them some years before. The

olive foliage had more of a silver sheen; the solitary, towering cypresses and pines here and there were delineated with more beautiful and more distinctive outlines; the places situated on the mountain heights seemed to him more charming, as if each one, in a manner, were an individual with different expression; and Trasimene Lake seemed to him of a soft blue such as he had never noticed in any surface of water. He had a feeling that a Nature unknown to him was surrounding the railway tracks, as if he must have passed through these places before in continual twilight, or during a grey rainfall, and was now seeing them for the first time in their golden abundance of colour. A few times he surprised himself in a desire, formerly unknown to him, to alight and seek afoot the way to this or that place because it looked to him as if it might be concealing something peculiar or mysterious. Yet he did not allow himself to be misled by such unreasonable impulses, but the “diretissimo” took him directly to Rome where, already, before the entrance into the station, the ancient world with the ruins of the temple of Minerva Medica received him. When he had finally freed himself from his cage filled with “inseparables,” he immediately secured accommodations in a hotel well known to him, in order to look about from there, without excessive haste, for a private house satisfactory to him.

Such a one he had not yet found in the course of the next day, but returned to his “albergo” again in the evening and went to sleep rather exhausted by the unaccustomed Italian air, the strong sun, much wandering about and the noise of the streets. Soon consciousness began to fade, but just as he was about to fall asleep he was again awakened, for his room was connected with the adjoining one by a door concealed only by a wardrobe, and into this came two guests, who had taken possession of it that morning. From the voices which sounded through the thin partition, they were a man and a woman who unmistakably belonged to that class of German spring birds of passage with whom he had yesterday journeyed hither from Florence. Their frame of mind seemed to give decidedly favourable testimony concerning the hotel cuisine, and it might be due to the good quality of a Castellin-romani wine that they exchanged ideas and feelings most distinctly and audibly in North German tongue:

“My only Augustus.”

“My sweet Gretchen.”

“Now again we have each other.”

“Yes, at last we are alone again.”

“Must we do more sight-seeing to-morrow?”

“At breakfast we shall look in *Baedeker* for what is still to be done.”

“My only Augustus, to me you are much more pleasing than Apollo Belvedere.”

“And I have often thought, my sweet Gretchen, that you are much more beautiful than the Capitoline Venus.”

“Is the volcano that we want to climb near here?”

“No, I think we’ll have to ride a few hours more in the train to get there.”

“If it should begin to belch flame just as we got to the middle, what would you do?”

“Then my only thought would be to save you, and I would take you in my arms — so.”

“Don’t scratch yourself on that pin!”

“I can think of nothing more beautiful than to shed my blood for you.”

“My only Augustus.”

“My sweet Gretchen.”

With that the conversation ceased, Norbert heard another ill-defined rustling and moving of chairs, then it became quiet and he fell back into a doze which transported him to Pompeii just as Vesuvius again began its eruption. A vivid throng of fleeing people caught him, and among them he saw Apollo Belvedere lift up the Capitoline Venus, take her away and place her safely upon some object in a dark shadow; it seemed to be a carriage or cart on which she was to be carried off, for a rattling sound was soon heard from that direction. This mythological occurrence did not amaze the young archæologist, but it struck him as remarkable that the two talked German, not Greek, to each other for, as they half regained their senses, he heard them say:

“My sweet Gretchen.”

“My only Augustus.”

But after that the dream picture changed completely. Absolute silence took the place of the confused sound, and instead of smoke and fire-glow, bright, hot sunlight rested on the ruins of the buried city. This likewise changed gradually, became a bed on whose white linen golden beams circled up to his eyes, and Norbert Hanold awoke in the scintillating spring morning of Rome.

Within him, also, however, something had changed; why, he could not surmise, but a strangely oppressive feeling had again taken possession of him, a feeling that he was imprisoned in a cage which this time was called Rome. As he opened the window, there screamed up from the street dozens of venders' cries far more shrill to his ear than those in his German home; he had come only from one noisy quarry to another, and a strangely uncanny horror of antique collections, of meeting there Apollo Belvedere or the Capitoline Venus, frightened him away. Thus, after brief consideration, he refrained from his intention of looking for a dwelling, hastily packed his valise again and went farther south by train. To escape the "inseparables," he did this in a third-class coach, expecting at the same time to find there an interesting and scientifically useful company of Italian folk-types, the former models of antique works of art. Yet he found nothing but the usual dirt, Monopol cigars which smelled horribly, little warped fellows beating about with arms and legs, and members of the female sex, in contrast to whom his coupled country-women seemed to his memory almost like Olympian goddesses.

* * * * *

Two days later Norbert Hanold occupied a rather questionable space called a "room" in "Hotel Diomed" beside the eucalyptus-guarded "ingresso" to the excavations of Pompeii. He had intended to stay in Naples for some time to study again more closely the sculptures and wall-paintings in the Museo Nazionale, but he had had an experience there similar to that in Rome. In the room for the collection of Pompeiian household furniture he found himself wrapped in a cloud of feminine, ultra-fashionable travel-costumes, which had doubtless all quickly replaced the virgin radiance of satin, silk or lace bridal finery; each one clung to the arm of a young or old companion, likewise faultlessly attired, according to men's fashion standards; and Norbert's newly gained insight into a field of knowledge formerly unknown to him had advanced so far as to permit him to recognize them at first glance; every man was Augustus, every girl was Gretchen. Only this came to light here by means of other forms of conversation tempered, moderated and modified by the ear of publicity.

"Oh, look, that was practical of them; we'll surely have to get a meat warmer like that, too."

“Yes, but for the food that my wife cooks it must be made of silver.”

“How do you know that what I cook will taste so good to you?”

The question was accompanied by a roguish, arch glance and was answered in the affirmative, with a glance varnished with lacquer, “What you serve to me can be nothing but delicious.”

“No; that surely is a thimble! Did the people of those days have needles?”

“It almost seems so, but you could not have done anything with that, my darling, it would be much too large even for your thumb.”

“Do you really think that? And do you like slender fingers better than broad ones?”

“Yours I do not need to see; by touch I could discover them, in the deepest darkness, among all the others in the world.”

“That is really awfully interesting. Do we still really have to go to Pompeii also?”

“No, that will hardly pay; there are only old stones and rubbish there; whatever was of value, *Baedeker* says, was brought here. I fear the sun there would be too hot for your delicate complexion, and I could never forgive myself that.”

“What if you should suddenly have a negress for a wife?”

“No, my imagination fortunately does not reach that far, but a freckle on your little nose would make me unhappy. I think, if it is agreeable to you, we’ll go to Capri to-morrow, my dear. There everything is said to be very comfortable, and in the wonderful light of the Blue Grotto I shall first realize completely what a great prize I have drawn in the lottery of happiness.”

“You — if any one hears that, I shall be almost ashamed. But wherever you take me, it is agreeable to me, and makes no difference, for I have you with me.”

Augustus and Gretchen over again, somewhat toned down and tempered for eye and ear. It seemed to Norbert Hanold that he had had thin honey poured upon him from all sides and that he had to dispose of it swallow by swallow. A sick feeling came over him, and he ran out of the Museo Nazionale to the nearest “osteria” to drink a glass of vermuth. Again and again the thought intruded itself upon his mind: Why did these hundredfold dualities fill the museums of Florence, Rome, Naples, instead of devoting themselves to their plural occupations in their native

Germany? Yet from a number of chats and tender talks, it seemed to him that the majority of these bird couples did not intend to nest in the rubbish of Pompeii, but considered a side trip to Capri much more profitable, and thence originated his sudden impulse to do what they did not do. There was at any rate offered to him a chance to be freed from the main flock of this migration and to find what he was vainly seeking here in Italy. That was also a duality, not a wedding duality, but two members of the same family without cooing bills, silence and science, two calm sisters with whom only one could count upon satisfactory shelter. His desire for them contained something formerly unknown to him; if it had not been a contradiction in itself, he could have applied to this impulse the epithet "passionate" — and an hour later he was already sitting in a "carrozzella" which bore him through the interminable Portici and Resina. The journey was like one through a street splendidly adorned for an old Roman victor; to the right and left almost every house spread out to dry in the sun, like yellow tapestry hangings, a super-abundant wealth of "pasta di Napoli," the greatest dainty of the country, thick or thin macaroni, vermicelli, spaghetti, canelloni and fidelini, to which smoke of fats from cook-shops, dust-clouds, flies and fleas, the fish scales flying about in the air, chimney smoke and other day and night influences lent the familiar delicacy of its taste. Then the cone of Vesuvius looked down close by across brown lava fields; at the right extended the gulf of shimmering blue, as if composed of liquid malachite and lapis lazuli. The little nutshell on wheels flew, as if whirled forth by a mad storm and as if every moment must be its last, over the dreadful pavement of Torre del Greco, rattled through Torre dell'Annunziata, reached the Dioscuri, "Hotel Suisse" and "Hotel Diomed," which measured their power of attraction in a ceaseless, silent, but ferocious struggle, and stopped before the latter whose classic name, again, as on his first visit, had determined the choice of the young archæologist. With apparently, at least, the greatest composure, however, the modern Swiss competitor viewed this event before its very door. It was calm because no different water from what it used was boiled in the pots of its classic neighbour; and the antique splendours temptingly displayed for sale over there had not come to light again after two thousand years under the ashes, any more than the ones which it had.

Thus Norbert Hanold, contrary to all expectations and intentions, had been transported in a few days from northern Germany to Pompeii, found

the “Diomed” not too much filled with human guests, but on the other hand populously inhabited by the *musca domestica communis*, the common house-fly. He had never been subject to violent emotions; yet a hatred of these two-winged creatures burned within him; he considered them the basest evil invention of Nature, on their account much preferred the winter to the summer as the only time suited to human life, and recognized in them invincible proof against the existence of a rational world-system. Now they received him here several months earlier than he would have fallen to their infamy in Germany, rushed immediately about him in dozens, as upon a patiently awaited victim, whizzed before his eyes, buzzed in his ears, tangled themselves in his hair, tickled his nose, forehead and hands. Therein many reminded him of honeymoon couples, probably were also saying to each other in their language, “My only Augustus” and “My sweet Gretchen”; in the mind of the tormented man rose a longing for a “scacciamosche,” a splendidly made fly-flapper like one unearthed from a burial vault, which he had seen in the Etruscan museum in Bologna. Thus, in antiquity, this worthless creature had likewise been the scourge of humanity, more vicious and more inevitable than scorpions, venomous snakes, tigers and sharks, which were bent upon only physical injury, rending or devouring the ones attacked; against the former one could guard himself by thoughtful conduct. From the common house-fly, however, there was no protection, and it paralysed, disturbed and finally shattered the psychic life of human beings, their capacity for thinking and working, every lofty flight of imagination and every beautiful feeling. Hunger or thirst for blood did not impel them, but solely the diabolical desire to torture; it was the “Ding an sich” in which absolute evil had found its incarnation. The Etruscan “scacciamosche,” a wooden handle with a bunch of fine leather strips fastened to it, proved the following: they had destroyed the most exalted poetic thoughts in the mind of Æschylus; they had caused the chisel of Phidias to make an irremediable slip, had run over the brow of Zeus, the breast of Aphrodite, and from head to foot of all Olympian gods and goddesses; and Norbert felt in his soul that the service of a human being was to be estimated, above all, according to the number of flies which he had killed, pierced, burned up or exterminated in hecatombs during his life, as avenger of his whole race from remotest antiquity.

For the achievement of such fame, he lacked here the necessary weapon, and like the greatest battle hero of antiquity, who had, however, been alone and unable to do otherwise, he left the field, or rather his room, in view of the hundredfold overwhelming number of the common foe. Outside it dawned upon him that he had thereby done in a small way what he would have to repeat on a larger scale on the morrow. Pompeii, too, apparently offered no peacefully gratifying abode for his needs. To this idea was added, at least dimly, another, that his dissatisfaction was certainly caused not by his surroundings alone, but to a degree found its origin in him. To be sure, flies had always been very repulsive to him, but they had never before transported him into such raging fury as this. On account of the journey his nerves were undeniably in an excited and irritable condition, for which indoor air and overwork at home during the winter had probably begun to pave the way. He felt that he was out of sorts because he lacked something without being able to explain what, and this ill-humour he took everywhere with him; of course flies and bridal couples swarming *en masse* were not calculated to make life agreeable anywhere. Yet if he did not wish to wrap himself in a thick cloud of self-righteousness, it could not remain concealed from him that he was travelling around Italy just as aimless, senseless, blind and deaf as they, only with considerably less capacity for enjoyment. For his travelling companion, science, had, most decidedly, much of an old Trappist about her, did not open her mouth when she was not spoken to, and it seemed to him that he was almost forgetting in what language he had communed with her.

It was now too late in the day to go into Pompeii through the “ingresso.” Norbert remembered a circuit he had once made on the old city-wall, and attempted to mount the latter by means of all sorts of bushes and wild growth. Thus he wandered along for some distance a little above the city of graves, which lay on his right, motionless and quiet. It looked like a dead rubbish field already almost covered with shadow, for the evening sun stood in the west not far from the edge of the Tyrrhenian Sea. Round about, on the other hand, it still bathed all the hilltops and fields with an enchanting brilliancy of life, gilded the smoke-cone rising above the Vesuvius crater and clad the peaks and pinnacles of Monte Sant’ Angelo in purple. High and solitary rose Monte Epomeo from the sparkling, blue sea glittering with golden light, from which Cape Misenum

reared itself with dark outline, like a mysterious, titanic structure. Wherever the gaze rested, a wonderful picture was spread combining charm and sublimity, remote past and joyous present. Norbert Hanold had expected to find here what he longed for vaguely. Yet he was not in the mood for it, although no bridal couples and flies molested him on the deserted wall; even nature was unable to offer him what he lacked in his surroundings and within himself. With a calmness bordering closely on indifference, he let his eyes pass over the all-pervading beauty, and did not regret in the least that it was growing pale and fading away in the sunset, but returned to the “Diomed,” as he had come, dissatisfied.

* * * * *

But as he had now, although with ill-success, been conveyed to this place through his indiscretion, he reached the decision overnight, to get from the folly he had committed at least one day of scientific profit, and went to Pompeii on the regular road as soon as the “ingresso” was opened in the morning. In little groups commanded by official guides, armed with red *Baedekers* or their foreign cousins, longing for secret excavations of their own, there wandered before and behind him the population of the two hotels. The still fresh, morning air was filled almost exclusively by English or Anglo-American chatter; the German couples were making each other mutually happy with German sweets and inspiration up there on Capri behind Monte Sant’ Angelo at the breakfast table of the Pagano. Norbert remembered how to free himself soon, by well chosen words, combined with a good “mancia,” from the burden of a “guida,” and was able to pursue his purposes alone and unhindered. It afforded him some satisfaction to know that he possessed a faultless memory; wherever his glance rested, everything lay and stood exactly as he remembered it, as if only yesterday he had imprinted it in his mind by means of expert observation. This continually repeated experience brought, however, the added feeling that his presence there seemed really very unnecessary, and a decided indifference took possession of his eyes and his intellect more and more, as during the evening on the wall. Although, when he looked up, the pine-shaped smoke-cone of Vesuvius generally stood before him against the blue sky, yet, remarkably, it did not once appear in his memory that he had dreamed some time ago that he had been present at the

destruction of Pompeii by the volcanic eruption of 79. Wandering around for hours made him tired and half-sleepy, of course, yet he felt not the least suggestion of anything dreamlike, but there lay about him only a confusion of fragments of ancient gate arches, pillars and walls significant to the highest degree for archæology, but, viewed without the esoteric aid of this science, really not much else than a big pile of rubbish, neatly arranged, to be sure, but extremely devoid of interest; and although science and dreams were wont formerly to stand on footings exactly opposed, they had apparently here to-day come to an agreement to withdraw their aid from Norbert Hanold and deliver him over absolutely to the aimlessness of his walking and standing around.

So he had wandered in all directions from the Forum to the Amphitheatre, from the Porta di Stabia to the Porta del Vesuvio through the Street of Tombs as well as through countless others, and the sun had likewise, in the meanwhile, made its accustomed morning journey to the position where it usually changes to the more comfortable descent toward the sea. Thereby, to the great satisfaction of their misunderstood, hoarsely eloquent guides, it gave the English and American men and women, forced to go there by a traveller’s sense of duty, a signal to become mindful of the superior comfort of sitting at the lunch-tables of the twin hotels; besides, they had seen with their own eyes everything that could be required for conversation on the other side of the ocean and channel; so the separate groups, satiated by the past, started on the return, ebbed in common movement down through the Via Marina, in order not to lose meals at the, to be sure somewhat euphemistically Lucullan, tables of the present, in the house of “Diomed” or of Mr. Swiss. In consideration of all the outer and inner circumstances, this was doubtless also the wisest thing that they could do, for the noon sun of May was decidedly well disposed toward the lizards, butterflies and other winged inhabitants or visitors of the extensive mass of ruins, but for the northern complexion of a Madame or Miss its perpendicular obtrusiveness was unquestionably beginning to become less kindly, and, supposedly in some causal connection with that, the “charmings” had already in the last hour considerably diminished, the “shockings” had increased in the same proportion, and the masculine “ah’s” proceeding from rows of teeth even more widely distended than before had begun a noticeable transition to yawning.

It was remarkable, however, that simultaneously with their vanishing, what had formerly been the city of Pompeii assumed an entirely changed appearance, but not a living one; it now appeared rather to be becoming completely petrified in dead immobility. Yet out of it stirred a feeling that death was beginning to talk, although not in a manner intelligible to human ears. To be sure, here and there was a sound as if a whisper were proceeding from the stone which, however, only the softly murmuring south wind, Atabulus, awoke, he who, two thousand years ago, had buzzed in this fashion about the temples, halls and houses, and was now carrying on his playful game with the green, shimmering stalks on the low ruins. From the coast of Africa he often rushed across, casting forth wild, full blasts: he was not doing that to-day, but was gently fanning again the old acquaintances which had come to light again. He could not, however, refrain from his natural tendency to devastate, and blew with hot breath, even though lightly, on everything that he encountered on the way.

In this, the sun, his eternally youthful mother, helped him. She strengthened his fiery breath, and accomplished, besides, what he could not, steeped everything with trembling, glittering, dazzling splendour. As with a golden eraser, she effaced from the edges of the houses on the *semitæ* and *crepidine viarum*, as the sidewalks were once called, every slight shadow, cast into all the vestibules, inner courts, peristyles and balconies her luminous radiance, or desultory rays where a shelter blocked her direct approach. Hardly anywhere was there a nook which successfully protected itself against the ocean of light and veiled itself in a dusky, silver web; every street lay between the old walls like long, rippling, white strips of linen spread out to bleach; and without exception all were equally motionless and mute, for not only had the last of the rasping and nasal tones of the English and American messengers disappeared, but the former slight evidences of lizard- and butterfly-life seemed also to have left the silent city of ruins. They had not really done so, but the gaze perceived no more movement from them.

As had been the custom of their ancestors out on the mountain slopes and cliff walls for thousands of years, when the great Pan laid himself to sleep, here, too, in order not to disturb him, they had stretched themselves out motionless or, folding their wings, had squatted here and there; and it seemed as if, in this place, they felt even more strongly the command of the hot, holy, noonday quiet in whose ghostly hour life must be silent and

suppressed, because during it the dead awake and begin to talk in toneless spirit-language.

This changed aspect which the things round about had assumed really thrust itself less upon the vision than it aroused the emotions, or, more correctly, an unnamed sixth sense; this latter, however, was stimulated so strongly and persistently that a person endowed with it could not throw off the effect produced upon him. To be sure, of those estimable boarders already busy with their soup spoons at the two “alberghi” near the “ingresso,” hardly a man or woman would have been counted among those thus invested, but Nature had once bestowed this great attention upon Norbert Hanold and he had to submit to its effects, not at all because he had an understanding with it, however, for he wished nothing at all and desired nothing more than that he might be sitting quietly in his study with an instructive book in his hand, instead of having undertaken this aimless spring journey. Yet as he had turned back from the Street of Tombs through the Hercules gate into the centre of the city, and at Casa di Sallustio had turned to the left, quite without purpose or thought, into the narrow “vicolo,” suddenly that sixth sense was awakened in him; but this last expression was not really fitting, rather he was transported by it into a strangely dreamy condition, about half-way between a waking state and loss of senses. As if guarding a secret, everywhere round about him, suffused in light, lay deathly silence, so breathless that even his own lungs hardly dared to take in air. He stood at the intersection of two streets where the Vicolo Mercurio crossed the broader Strada di Mercurio, which stretched out to right and left; in answer to the god of commerce, business and trades had formerly had their abodes here; the street corners spoke silently of it; many shops with broken counters, inlaid with marble, opened out upon them; here the arrangement indicated a bakery, there, a number of large, convex, earthenware jugs, an oil or flour business. Opposite more slender, two-handled jars set into the counters showed that the space behind them had been a bar-room; surely in the evening, slaves and maids of the neighbourhood might have thronged here to get wine for their masters in their own jugs; one could see that the now illegible inscription inlaid with mosaic on the sidewalk in front of the shop was worn by many feet; probably it had held out to passers-by a recommendation of the excellent wine. On the outer wall, at about half the height of a man, was visible a “graffito” probably scratched into the

plastering, with his finger-nail or an iron nail, by a schoolboy, perhaps derisively explaining the praise, in this way, that the owner's wine owed its peerlessness to a generous addition of water. For from the scratch there seemed raised before Norbert Hanold's eyes the word "caupo," or was it an illusion. Certainly he could not settle it. He possessed a certain skill in deciphering "graffiti" which were difficult, and had already accomplished widely recognized work in that field, yet at this time it completely failed him. Not only that, he had a feeling that he did not understand any Latin, and it was absurd of him to wish to read what a Pompeiian school youth had scratched into the wall two thousand years before.

Not only had all his science left him, but it left him without the least desire to regain it; he remembered it as from a great distance, and he felt that it had been an old, dried-up, boresome aunt, dullest and most superfluous creature in the world. What she uttered with puckered lips and sapient mien, and presented as wisdom, was all vain, empty pompousness, and merely gnawed at the dry rind of the fruit of knowledge without revealing anything of its content, the germ of life, or bringing anything to the point of inner, intelligent enjoyment. What it taught was a lifeless, archæological view, and what came from its mouth was a dead, philological language. These helped in no way to a comprehension with soul, mind and heart, as the saying is, but he, who possessed a desire for that, had to stand alone here, the only living person in the hot noonday silence among the remains of the past, in order not to see with physical eyes nor hear with corporeal ears. Then something came forth everywhere without movement and a soundless speech began; then the sun dissolved the tomblike rigidity of the old stones, a glowing thrill passed through them, the dead awoke, and Pompeii began to live again.

The thoughts in Norbert Hanold's mind were not really blasphemous, but he had an indefinite feeling deserving of that adjective, and with this, standing motionless, he looked before him down the Strada di Mercurio toward the city-wall. The angular lava-blocks of its pavement still lay as faultlessly fitted together as before the devastation, and each one was of a light-grey colour, yet such dazzling lustre brooded over them that they stretched like a quilted silver-white ribbon passing in faintly glowing void between the silent walls and by the side of column fragments.

Then suddenly —

With open eyes he gazed along the street, yet it seemed to him as if he were doing it in a dream. A little to the right something suddenly stepped forth from the Casa di Castore e Polluce, and across the lava stepping-stones, which led from the house to the other side of the Strada di Mercurio, Gradiva stepped buoyantly.

Quite indubitably it was she; even if the sunbeams did surround her figure as with a thin veil of gold, he perceived her in profile as plainly and as distinctly as on the bas-relief. Her head, whose crown was entwined with a scarf which fell to her neck, inclined forward a little; her left hand held up lightly the extremely voluminous dress and, as it reached only to her ankles, one could perceive clearly that in advancing, the right foot, lingering, if only for a moment, rose on the tips of the toes almost perpendicularly. Here, however, it was not a stone representation, everything in uniform colourlessness; the dress, apparently made of extremely soft, clinging material, was not of cold marble-white, but of a warm tone verging faintly on yellow, and her hair, wavy under the scarf on her brow, and peeping forth at the temples, stood out, with golden-brown radiance, in bold contrast to her alabaster countenance.

As soon as he caught sight of her, Norbert’s memory was clearly awakened to the fact that he had seen her here once already in a dream, walking thus, the night that she had lain down as if to sleep over there in the Forum on the steps of the Temple of Apollo. With this memory he became conscious, for the first time, of something else; he had, without himself knowing the motive in his heart, come to Italy on that account and had, without stop, continued from Rome and Naples to Pompeii to see if he could here find trace of her — and that in a literal sense — for, with her unusual gait, she must have left behind in the ashes a foot-print different from all the others.

Again it was a noonday dream-picture that passed there before him and yet also a reality. For that was apparent from an effect which it produced. On the last stepping-stone on the farther side, there lay stretched out motionless, in the burning sunlight, a big lizard, whose body, as if woven of gold and malachite, glistened brightly to Norbert’s eyes. Before the approaching foot, however, it darted down suddenly and wriggled away over the white, gleaming lava pavement.

Gradiva crossed the stepping-stones with her calm buoyancy, and now, turning her back, walked along on the opposite sidewalk; her destination

seemed to be the house of Adonis. Before it she stopped a moment, too, but passed then, as if after further deliberation, down farther through the Strada di Mercurio. On the left, of the more elegant buildings, there now stood only the Casa di Apollo, named after the numerous representations of Apollo excavated there, and, to the man who was gazing after her, it seemed again that she had also surely chosen the portico of the Temple of Apollo for her death sleep. Probably she was closely associated with the cult of the sun-god and was going there. Soon, however, she stopped again; stepping-stones crossed the street here, too, and she walked back again to the right side. Thus she turned the other side of her face toward him and looked a little different, for her left hand, which held up her gown, was not visible and instead of her curved arm, the right one hung down straight. At a greater distance now, however, the golden waves of sunlight floated around her with a thicker web of veiling, and did not allow him to distinguish where she had stopped, for she disappeared suddenly before the house of Meleager. Norbert Hanold still stood without having moved a limb. With his eyes, and this time with his corporeal ones, he had surveyed, step by step, her vanishing form. Now, at length, he drew a deep breath, for his breast too had remained almost motionless.

Simultaneously the sixth sense, suppressing the others completely, held him absolutely in its sway. Had what had just stood before him been a product of his imagination or a reality?

He did not know that, nor whether he was awake or dreaming, and tried in vain to collect his thoughts. Then, however, a strange shudder passed down his spine. He saw and heard nothing, yet he felt from the secret inner vibrations that Pompeii had begun to live about him in the noonday hour of spirits, and so Gradiva lived again, too, and had gone into the house which she had occupied before the fateful August day of the year 79.

From his former visit, he was acquainted with the Casa di Meleagro, had not yet gone there this time, however, but had merely stopped briefly in the Museo Nazionale of Naples before the wall paintings of Meleager and his Arcadian huntress companion, Atalanta, which had been found in the Strada di Mercurio in that house, and after which the latter had been named. Yet as he now again acquired the ability to move and walked toward it, he began to doubt whether it really bore its name after the slayer of the Caledonian boar. He suddenly recalled a Greek poet, Meleager, who, to be sure, had probably lived about a century before the destruction of

Pompeii. A descendant of his, however, might have come here and built the house for himself. That agreed with something else that had awakened in his memory, for he remembered his supposition, or rather a definite conviction, that Gradiva had been of Greek descent. To be sure there mingled with his idea the figure of Atalanta as Ovid had pictured it in his *Metamorphoses*:

— her floating vest
A polished buckle clasped — her careless locks
In simple knot were gathered —

Trans. by Henry King.

He could not recall the verses word for word, but their content was present in his mind; and from his store of knowledge was added the fact that Cleopatra was the name of the young wife of Œneus' son, Meleager. More probably this had nothing to do with him, but with the Greek poet, Meleager. Thus, under the glowing sun of the Campagna, there was a mythological-literary-historical-archæological juggling in his head.

When he had passed the house of Castor and Pollux and that of the Centaur, he stood before the Casa di Meleagro from whose threshold there looked up at him, still discernible, the inlaid greeting "Ave." On the wall of the vestibule, Mercury was handing Fortuna a pouch filled with money; that probably indicated, allegorically, the riches and other fortunate circumstances of the former dweller. Behind this opened up the inner court, the centre of which was occupied by a marble table supported by three griffins.

Empty and silent, the room lay there, appearing absolutely unfamiliar to the man, as he entered, awaking no memory that he had already been here, yet he then recalled it, for the interior of the house offered a deviation from that of the other excavated buildings of the city. The peristyle adjoined the inner court on the other side of the balcony toward the rear — not in the usual way, but at the left side and on that account was of greater extent and more splendid appearance than any other in Pompeii. It was framed by a colonnade supported by two dozen pillars painted red on the lower, and white on the upper half. These lent solemnity to the great, silent space; here in the centre was a spring with a beautifully

wrought enclosure, which served as a fish-pool. Apparently the house must have been the dwelling of an estimable man of culture and artistic sense.

Norbert's gaze passed around, and he listened. Yet nowhere about did anything stir, nor was the slightest sound audible. Amidst this cold stone there was no longer a breath; if Gradiva had gone into Meleager's house, she had already dissolved again into nothing. At the rear of the peristyle was another room, an *œcus*, the former dining-room, likewise surrounded on three sides by pillars painted yellow, which shimmered from a distance in the light, as if they were encrusted with gold. Between them, however, shone a red far more dazzling than that from the walls, with which no brush of antiquity, but young Nature of the present had painted the ground. The former artistic pavement lay completely ruined, fallen to decay and weather worn; it was May which exercised here again its most ancient dominion and covered the whole *œcus*, as it did at the time in many houses of the buried city, with red, flowering, wild poppies, whose seeds the winds had carried thither, and these had sprouted in the ashes. It was a wave of densely crowded blossoms, or so it appeared, although, in reality, they stood there motionless, for Atabulus found no way down to them, but only hummed away softly above. Yet the sun cast such flaming, radiant vibrations down upon them that it gave an impression of red ripples in a pond undulating hither and thither. Norbert Hanold's eyes had passed unheeding over a similar sight in other houses, but here he was strangely thrilled by it. The dream-flower grown at the edge of Lethe filled the space, and Hypnos lay stretched in their midst dispensing sleep, which dulls the senses, with the saps which night has gathered in the red chalices. It seemed to the man who had entered the dining-room through the portico of the peristyle as if he felt his temples touched by the invisible slumber wand of the old vanquisher of gods and men, but not with heavy stupor; only a dreamily sweet loveliness floated about his consciousness. At the same time, however, he still remained in control of his feet and stepped along by the wall of the former dining-room from which gazed old pictures: Paris, awarding the apple; a satyr, carrying in his hand an asp and tormenting a young Bacchante with it.

But there again suddenly, unforeseen — only about five paces away from him — in the narrow shadow cast down by a single piece of the upper part of the dining-room portico, which still remained in a state of preservation, sitting on the low steps between two of the yellow pillars

was a brightly clad woman who now raised her head. In that way she disclosed to the unnoticed arrival, whose footstep she had apparently just heard, a full view of her face, which produced in him a double feeling, for it appeared to him at the same time unknown and yet also familiar, already seen or imagined; but by his arrested breathing and his heart palpitations, he recognized, unmistakably, to whom it belonged. He had found what he was looking for, what had driven him unconsciously to Pompeii; Gradiva continued her visible existence in the noonday spirit hour and sat here before him, as, in the dream, he had seen her on the steps of the Temple of Apollo. Spread out on her knees lay something white, which he was unable to distinguish clearly; it seemed to be a papyrus sheet, and a red poppy-blossom stood out from it in marked contrast.

In her face surprise was expressed; under the lustrous, brown hair and the beautiful, alabaster brow, two rarely bright, starlike eyes looked at him with questioning amazement. It required only a few moments for him to recognize the conformity of her features with those of the profile. They must be thus, viewed from the front, and therefore, at first glance, they had not been really unfamiliar to him. Near to, her white dress, by its slight tendency to yellow, heightened still more the warm colour; apparently it consisted of a fine, extremely soft, woollen material, which produced abundant folds, and the scarf around her head was of the same. Below, on the nape of the neck, appeared again the shimmering, brown hair artlessly gathered in a single knot; at her throat, under a dainty chin, a little gold clasp held her gown together.

Norbert Hanold dimly perceived that involuntarily he had raised his hand to his soft Panama hat and removed it; and now he said in Greek, “Are you Atalanta, the daughter of Jason, or are you a descendant of the family of the poet, Meleager?”

Without giving an answer, the lady addressed looked at him silently with a calmly wise expression in her eyes, and two thoughts passed through his mind; either her resurrected self could not speak, or she was not of Greek descent and was ignorant of the language. He therefore substituted Latin for it and asked: “Was your father a distinguished Pompeiian citizen of Latin origin?”

To this she was equally silent, only about her delicately curved lips there was a slight quiver as if she were repressing a burst of laughter. Now a feeling of fright came upon him; apparently she was sitting there before

him like a silent image, a phantom to whom speech was denied. Consternation at this discovery was stamped fully and distinctly upon his features.

Then, however, her lips could no longer resist the impulse; a real smile played about them and at the same time a voice sounded from between them, “If you wish to speak with me, you must do so in German.”

That was really remarkable from the mouth of a Pompeiian woman who had died two centuries before, or would have been so for a person hearing it in a different state of mind. Yet every oddity escaped Norbert because of two waves of emotion which had rushed over him, one because Gradiva possessed the power of speech, and the other was one which had been forced from his inmost being by her voice. It sounded as clear as was her glance; not sharp, but reminiscent of the tones of a bell, her voice passed through the sunny silence over the blooming poppy-field, and the young archæologist suddenly realized that he had already heard it thus in his imagination, and involuntarily he gave audible expression to his feeling, “I knew that your voice sounded like that.”

One could read in her countenance that she was seeking comprehension of something, but was not finding it. To his last remark she now responded, “How could you? You have never talked with me.”

To him it was not at all remarkable that she spoke German, and, according to present usage, addressed him formally; as she did it, he understood completely that it could not have happened otherwise, and he answered quickly, “No — not talked — but I called to you when you lay down to sleep and stood near you then — your face was as calmly beautiful as if it were of marble. May I beg you — rest it again on the step in that way.”

While he was speaking, something peculiar had occurred. A golden butterfly, faintly tinged with red on the inner edge of its upper wing, fluttered from the poppies toward the pillars, flitted a few times about Gradiva’s head and then rested on the brown, wavy hair above her brow. At the same time, however, she rose, slender and tall, for she stood up with deliberate haste, curtly and silently directed at Norbert another glance, in which something suggested that she considered him demented; then, thrusting her foot forward, she walked out in her characteristic way along the pillars of the old portico. Only fleetingly visible for a while, she finally seemed to have sunk into the earth.

He stood up, breathless, as if stunned; yet with heavy understanding he had grasped what had occurred before his eyes. The noonday ghost hour was over, and in the form of a butterfly, a winged messenger had come up from the asphodel meadows of Hades to admonish the departed one to return. For him something else was associated with this, although in confused indistinctness. He knew that the beautiful butterfly of Mediterranean countries bore the name Cleopatra, and this had also been the name of Caledonian Meleager's young wife who, in grief over his death, had given herself as sacrifice to those of the lower world.

From his mouth issued a call to the girl who was departing, "Are you coming here again to-morrow in the noon hour?" Yet she did not turn around, gave no answer, and disappeared after a few moments in the corner of the dining-room behind the pillar. Now a compelling impulse suddenly incited him to hasten after her, but her bright dress was no longer visible anywhere; glowing with the hot sun's rays, the Casa di Meleagro lay about him motionless and silent; only Cleopatra hovered on her red, shimmering, golden wings, making slow circles again above the multitude of poppies.

* * * * *

When and how he had returned to the "ingresso," Norbert Hanold could not recall; in his memory he retained only the idea that his appetite had peremptorily demanded to be appeased, though very tardily, at the "Diomed," and then he had wandered forth aimlessly on the first good street, had arrived at the beach north of Castellamare, where he had seated himself on a lava-block, and the sea-wind had blown around his head until the sun had set about half-way between Monte Sant' Angelo above Sorrento and Monte Epomeo on Ischia. Yet, in spite of this stay of at least several hours by the water, he had obtained from the fresh air there no mental relief, but was returning to the hotel in the same condition in which he had left it. He found the other guests busily occupied with dinner, had a little bottle of Vesuvio wine brought to him in a corner of the room, viewed the faces of those eating, and listened to their conversations. From the faces of all, as well as from their talk, it appeared to him absolutely certain that in the noon hour none of them had either met or spoken to a dead Pompeiian woman who had returned again briefly to life. Of course,

all this had been a foregone conclusion, as they had all been at lunch at that time; why and wherefore, he himself could not state, yet after a while he went over to the competitor of the “Diomed,” “Hotel Suisse,” sat down there also in a corner, and, as he had to order something, likewise before a little bottle of Vesuvio, and here he gave himself over to the same kind of investigations with eye and ear. They led to the same results but also to the further conclusion that he now knew by sight all the temporary, living visitors of Pompeii. To be sure, this effected an increase of his knowledge which he could hardly consider an enrichment, but from it he experienced a certain satisfying feeling that, in the two hostelries, no guest, either male or female, was present with whom, by means of sight and hearing, he had not entered into a personal, even if one-sided, relation. Of course, in no way had the absurd supposition entered his mind that he might possibly meet Gradiva in one of the two hotels, but he could have taken his oath that no one was staying in them who possessed, in the remotest way, any trace of resemblance to her. During his observations, he had occasionally poured wine from his little bottle to his glass, and had drunk from time to time; and when, in this manner, the former had gradually become empty, he rose and went back to the “Diomed.” The heavens were now strewn with countless, flashing, twinkling stars, but not in the traditionally stationary way, for Norbert gathered the impression that Perseus, Cassiopeia and Andromeda with some neighbours, bowing lightly hither and thither, were performing a singing dance, and below, on earth, too, it seemed to him that the dark shadows of the tree-tops and buildings did not stay in the same place. Of course on the ground of this region — unsteady from ancient times — this could not be exactly surprising, for the subterranean glow lurked everywhere, after an eruption, and let a little of itself rise in the vines and grapes from which was pressed Vesuvio, which was not one of Norbert Hanold’s usual evening drinks. He still remembered, however, even if a little of the circular movement of things might be ascribed to the wine, too, that since noon all objects had displayed an inclination to whirl softly about his head, and therefore he found, in the slight increase, nothing new, but only a continuation of the formerly existing conditions. He went up to his room and stood for a little while at the open window, looking over toward the Vesuvius mound, above which now no cone of smoke spread its top, but rather something like the fluctuations of a dark, purple cloak flowed back and forth around it. Then

the young archæologist undressed, without having lighted the light, and sought his couch. Yet, as he stretched himself out upon it, it was not his bed at the “Diomed,” but a red poppy-field whose blossoms closed over him like a soft cushion heated by the sun. His enemy, the common house-fly, constrained by darkness to lethargic stupidity, sat fiftyfold above his head, on the wall, and only one moved, even in its sleepiness, by desire to torture, buzzed about his nose. He recognized it, however, not as the absolute evil, the century-old scourge of humanity, for before his eyes it poised like a red-gold Cleopatra.

When, in the morning, the sun, with lively assistance from the flies, awoke him, he could not recall what, besides strange, Ovid-like metamorphoses, had occurred during the night about his bed. Yet doubtless some mystic being, continuously weaving dream-webs, had been sitting beside him, for he felt his head completely overhung and filled with them, so that all ability to think lay inextricably imprisoned in it and only one thing remained in his consciousness; he must again be in Meleager’s house at exactly noon. In this connection, however, a fear overcame him, for if the gatekeepers at the “ingresso” looked at him, they would not let him in. Anyway it was not advisable that he should expose himself to close observation by human eyes. To escape that, there was, for one well informed about Pompeii, a means which was, to be sure, against the rules, but he was not in a condition to grant to legal regulation a determination of his conduct. So he climbed again, as on the evening of his arrival, along the old city-wall, and upon it walked, in a wide semicircle, around the city of ruins to the solitary, unguarded Porta di Nola. Here it was not difficult to get down into the inside and he went, without burdening his conscience very much over the fact that by his autocratic deed he had deprived the administration of a two-lira entrance fee, which he could, of course, let it have later in some other way.

Thus, unseen, he had reached an uninteresting part of the city, never before investigated by any one and still mostly unexcavated; he sat down in a secluded, shady nook and waited, now and then drawing his watch to observe the progress of time. Once his glance fell upon something in the distance gleaming, silvery-white, rising from the ashes, but with his unreliable vision, he was unable to distinguish what it was. Yet involuntarily he was impelled to go up to it and there it stood, a tall, flowering asphodel-plant with white, bell-like blossoms whose seeds the

wind had carried thither from outside. It was the flower of the lower world, significant and, as he felt, destined to grow here for his purpose. He broke the slender stem and returned with it to his seat. Hotter and hotter the May sun burned down as on the day before, and finally approached its noonday position; so now he started out through the long Strada di Nola. This lay deathly still and deserted, as did almost all the others; over there to the west all the morning visitors were already crowding again to the Porta Marina and the soup-plates. Only the air, suffused with heat, stirred, and in the dazzling glare the solitary figure of Norbert Hanold with the asphodel branch appeared like that of Hermes, Psyche's escort, in modern attire, starting out upon the journey to conduct a departed soul to Hades.

Not consciously, yet following an instinctive impulse, he found his way through the Strada della Fortuna farther along to the Strada di Mercurio, and turning to the right arrived at the Casa di Meleagro. Just as lifelessly as yesterday, the vestibule, inner court and peristyle received him, and between the pillars of the latter the poppies of the dining-room flamed across to him. As he entered, however, it was not clear to him whether he had been here yesterday or two thousand years ago to seek from the owner of the house some information of great importance to archæology; what it was, however, he could not state, and besides, it seemed to him, even though in contradiction to the above, that all the science of antiquity was the most purposeless and indifferent thing in the world. He could not understand how a human being could occupy himself with it, for there was only a single thing to which all thinking and investigation must be directed: what is the nature of the physical manifestation of a being like Gradiva, dead and alive at the same time, although the latter was true only in the noon hour of spirits — or had been the day before, perhaps the one time in a century or a thousand years, for it suddenly seemed certain that his return to-day was in vain. He did not meet the girl he was looking for, because she was not allowed to come again until a time when he too would have been dead for many years, and was buried and forgotten. Of course, as he walked now along by the wall below Paris awarding the apple, he perceived Gradiva before him, just as on yesterday, in the same gown, sitting between the same two yellow pillars on the same step. Yet he did not allow himself to be deceived by tricks of imagination, but knew that fancy alone was deceptively depicting before his eyes what he had really seen there the day before. He could not refrain, however, from stopping to

indulge in the view of the shadowy apparition created by himself and, without his knowing it, there passed from his lips in a grieved tone the words, “Oh, that you were still alive!”

His voice rang out, but, after that, breathless silence again reigned among the ruins of the old dining-room. Yet soon another sounded through the vacant stillness, saying, “Won’t you sit down too? You look exhausted.”

Norbert Hanold’s heart stood still a moment. His head, however, collected this much reason; a vision could not speak; or was an aural hallucination practising deception upon him? With fixed gaze, he supported himself against the pillar.

Then again asked the voice, and it was the one which none other than Gradiva possessed, “Are you bringing me the white flowers?”

Dizziness rushed upon him; he felt that his feet no longer supported him, but forced him to be seated; and he slid down opposite her on the step, against the pillar. Her bright eyes were directed toward his face, yet with a different look from the one with which she had gazed at him yesterday when she suddenly rose and went away. In that, something ill-humoured and repellent had spoken; but it had disappeared, as if she had, in the meanwhile, arrived at a different view-point, and an expression of searching inquisitiveness or curiosity had taken its place. Likewise, she spoke with an easy familiarity. As he remained silent, however, to the last question also, she again resumed, “You told me yesterday that you had once called to me when I lay down to sleep and that you had afterwards stood near me; my face was as white as marble. When and where was that? I cannot remember it, and I beg you to explain more exactly.”

Norbert had now acquired enough power of speech to answer, “In the night when you sat on the steps of the Temple of Apollo in the Forum and the fall of ashes from Vesuvius covered you.”

“So — then. Yes, to be sure — that had not occurred to me, but I might have thought that it would be a case like that. When you said it yesterday, I was not expecting it, and I was utterly unprepared. Yet that happened, if I recall correctly, two thousand years ago. Were you living then? It seems to me you look younger.” She spoke very seriously, but at the end a faint, extremely sweet smile played about her mouth. He hesitated in embarrassment and answered, stuttering slightly, “No, I really don’t believe I was alive in the year 79 — it was perhaps — yes, it surely is a

psychic condition which is called a dream that transported me into the time of the destruction of Pompeii — but I recognized you again at first glance.”

In the expression of the girl sitting opposite him, a few feet away, surprise was apparent, and she repeated in a tone of amazement, “You recognized me again? In the dream? By what?”

“At the very first; by your manner of walking.”

“Had you noticed that? And have I a special manner of walking?”

Her astonishment had grown perceptibly. He replied, “Yes — don’t you realize that? A more graceful one — at least among those now living — does not exist. Yet I recognized you immediately by everything else too, your figure, face, bearing and drapery, for everything agreed most minutely with the bas-relief of you in Rome.”

“Ah, really—” she repeated in her former tone— “with the bas-relief of me in Rome. Yes, I hadn’t thought of that either, and at this moment I don’t know exactly — what is it — and you saw it there then?”

Now he told her that the sight of it had attracted him so that he had been highly pleased to get a plaster-cast of it in Germany, and that for years it had hung in his room. He observed it daily, and the idea had come to him that it must represent a young Pompeiian girl who was walking on the stepping-stones of a street in her native city; and the dream had confirmed it. Now he knew also that he had been impelled by it to travel here again to see whether he could find some trace of her; and as he had stood yesterday noon at the corner of Strada di Mercurio, she, herself, exactly like her image, had suddenly walked before him across the stepping-stones, as if she were about to go over into the house of Apollo. Then farther along she had recrossed the street and disappeared before the house of Meleager.

To this she nodded and said, “Yes, I intended to look up the house of Apollo, but I came here.”

He continued, “On that account the Greek poet, Meleager, came to my mind, and I thought that you were one of his descendants and were returning — in the hour which you are allowed — to your ancestral home. When I spoke to you in Greek, however, you did not understand.”

“Was that Greek? No, I don’t understand it or I’ve probably forgotten it. Yet as you came again just now, I heard you say something that I could

understand. You expressed the wish that some one might still be alive here. Only I did not understand whom you meant by that."

That caused him to reply that, at sight of her, he had believed that it was not really she, but that his imagination was deceptively putting her image before him in the place where he had met her yesterday. At that she smiled and agreed, "It seems that you have reason to be on your guard against an excess of imagination, although, when I have been with you, I never supposed so." She stopped, however, and added, "What is there peculiar about my way of walking, which you spoke of before?"

It was noteworthy that her aroused interest brought her back to that, and he said, "If I may ask — —"

With that he stopped, for he suddenly remembered with fear that yesterday she had suddenly risen and gone away when he had asked her to lie down to sleep again on that step, as on that of the Temple of Apollo, and, associated darkly with this, there came to him the glance which she had directed upon him in departing. Yet now the calm, friendly expression of her eyes remained, and as he spoke no further, she said, "It was nice that your wish that some one might still be alive concerned me. If you wish to ask anything of me on that account, I will gladly respond."

That overcame his fear, and he replied, "It would make me happy to get a close view of you walking as you do in the bas-relief."

Willingly, without answering, she stood up and walked along between the wall and the pillars. It was the very buoyantly reposeful gait, with the sole raised almost perpendicularly, that was so firmly imprinted on his mind, but for the first time he saw that she wore, below the raised gown, not sandals, but light, sand-coloured shoes of fine leather. When she came back and sat down again silently, he involuntarily started to talk of the difference in her foot-covering from that of the bas-relief. To that she rejoined, "Time, of course, always changes everything, and for the present sandals are not suitable, so I put on shoes, which are a better protection against rain and dust; but why did you ask me to walk before you? What is there peculiar about it?"

Her repeated wish to learn this proved her not entirely free from feminine curiosity. He now explained that it was a matter of the peculiarly upright position of the rising foot, as she walked, and he added how for weeks he had tried to observe the gait of modern women on the streets in his native city. Yet it seemed that this beautiful way of walking had been

completely lost to them, with the exception, perhaps, of a single one who had given him the impression that she walked in that way. To be sure, he had not been able to establish this fact because of the crowd about her, and he had probably experienced an illusion, for it had seemed to him that her features had resembled somewhat those of Gradiva.

“What a shame,” she answered. “For confirmation of the fact would surely have been of great scientific importance, and if you had succeeded, perhaps you would not have needed to take the long journey here; but whom were you just speaking of? Who is Gradiva?”

“I have named the bas-relief that, because I didn’t know your real name, and don’t know it yet, either.”

This last he added with some hesitancy, and she faltered a moment before replying to the indirect question. “My name is Zoë.”

With pained tone the words escaped him: “The name suits you beautifully, but it sounds to me like bitter mockery, for ‘Zoë’ means ‘life.’”

“One must adapt himself to the inevitable,” she responded, “and I have long accustomed myself to being dead; but now my time is over for to-day; you have brought the grave-flower with you to conduct me back. So give it to me.”

As she rose and stretched forth her slender hand, he gave her the asphodel cluster, but was careful not to touch her fingers. Accepting the flowering branch she said, “I thank you. To those who are more fortunate one gives roses in spring, but for me the flower of oblivion is the right one from your hand. To-morrow I shall be allowed to come here again at this hour. If your way leads you again into the house of Meleager, we can sit together at the edge of the poppies, as we did to-day. On the threshold stands ‘Ave,’ and I say it to you ‘Ave’!”

She went out and disappeared, as yesterday, at the turn in the portico, as if she had there sunk into the ground. Everything lay empty and silent again, but, from some distance, there once rang, short and clear, a sound like the merry note of a bird flying over the devastated city. This was stifled immediately, however. Norbert, who had remained behind, looked down at the step where she had just been sitting; there something white shimmered; it seemed to be the papyrus leaf which Gradiva had held on her knees yesterday and had forgotten to take with her to-day. Yet, as he shyly reached for it, he found it to be a little sketch-book with pencil

drawings of the different ruins in several houses of Pompeii. The page next to the last showed a drawing of the griffin-table in the central court of the Casa di Meleagro, and on the last was the beginning of a reproduction of the view across the poppies of the dining-room through the row of pillars of the peristyle. That the departed girl made drawings in a sketch-book of the present mode was as amazing as had been the fact that she expressed her thoughts in German. Yet those were only insignificant prodigies beside the great one of her revivification, and apparently she used the midday hour of freedom to preserve for herself, in their present state, with unusual artistic talent, the surroundings in which she had once lived. The drawings testified to delicately cultivated powers of perception, as each of her words did to a clever intellect; and she had probably often sat by the old griffin-table, so that it was a particularly precious reminder.

Mechanically Norbert also went, with the little book, along the portico, and at the place where this turned he noticed in the wall a narrow cleft wide enough to afford, to an unusually slender figure, passage into the adjoining building, and even farther to the Vicolo del Fauno at the other side of the house. Suddenly, however, the idea flashed through his mind that Zoë-Gradiva did not sink into the ground here — that was essentially unreasonable, and he could not understand how he had ever believed it — but went, on this street, back to her tomb. That must be in the Street of Tombs, and rushing forth, he hastened out into the Strada di Mercurio and as far as the gate of Hercules; but when, breathless and reeking with perspiration, he entered this, it was already too late. The broad Strada di Sepolcri stretched out empty and dazzlingly white, only at its extremity, behind the glimmering curtain of radiance, a faint shadow seemed to dissolve uncertainly before the Villa of Diomede.

* * * * *

Norbert Hanold passed the second half of the day with a feeling that Pompeii was everywhere, or at least wherever he stopped, veiled in a cloud of mist. It was not grey, gloomy and melancholy as formerly, but rather cheerful and vari-coloured to an extraordinary degree; blue, red and brown, chiefly a light-yellowish white and alabaster white, interwoven with golden threads of sunbeams. This injured neither his power of vision nor that of hearing, only, because of it, thinking was impossible, and that

produced a cloud-wall whose effect rivalled the thickest mist. To the young archæologist it seemed almost as if hourly, in an invisible and not otherwise noticeable way, there was brought to him a little bottle of Vesuvio wine, which produced a continuous whirling in his head. From this he instinctively sought to free himself by the use of correctives, on the one hand drinking water frequently, and on the other hand moving about as much and as far as possible. His knowledge of medicine was not comprehensive, but it helped him to the diagnosis that this strange condition must arise from excessive congestion of blood in his head, perhaps associated with accelerated action of the heart; for he felt the latter — something formerly quite unknown to him — occasionally beating fast against his chest. Otherwise, his thoughts, which could not penetrate into the outer world, were not in the least inactive within, or more exactly, there was only one thought there, which had come into sole possession and carried on a restless, though vain activity. It continually turned about the question of what physical nature Zoë-Gradiva might possess, whether during her stay in the house of Meleager she was a corporeal being or only an illusory representation of what she had formerly been. For the former, physical, physiological and anatomical facts seemed to argue that she had at her disposal organs of speech, and could hold a pencil with her fingers. Yet Norbert was overwhelmed with the idea that if he should touch her, even lightly place his hand on hers, he would then encounter only empty air. A peculiar impulse urged him to make sure of this, but an equally great timidity hindered him from even thinking of doing it. For he felt that the confirmation of either of the two possibilities must bring with it something inspiring fear. The corporeal existence of the hand would thrill him with horror, and its lack of substance would cause him deep pain.

Occupied vainly with this problem, which was impossible to solve scientifically without experiment, he arrived, in the course of his extensive wanderings that afternoon, at the foothills of the big mountain group of Monte Sant’ Angelo, rising south from Pompeii, and here he unexpectedly came upon an elderly man, already grey-bearded, who, from his equipment with all sorts of implements, seemed to be a zoologist or botanist, and appeared to be making a search on a hot, sunny slope. He turned his head as Norbert came close to him, looked at the latter in surprise for a moment and then said, “Are you interested in *Faraglionensis*? I should hardly have

supposed it, but it seems thoroughly probable that they are found, not only in the *Faraglioni* of Capri, but also dwell permanently on the mainland. The method suggested by my colleague, Eimer, is really good; I have already used it often with the best of success. Please remain quite still — —”

The speaker stopped, stepped carefully forward a few paces and, stretched out motionless on the ground, held a little snare, made of a long grass-blade, before a narrow crevice in the rock, from which the blue, chatoyant little head of a lizard peeped. Thus the man remained without the slightest movement, and Norbert Hanold turned about noiselessly behind him and returned by the way he had come. It seemed to him dimly that he had already seen the face of the lizard-hunter once, probably in one of the two hotels; to this fact the latter’s manner pointed. It was hardly credible what foolishly remarkable purposes could cause people to make the long trip to Pompeii; happy that he had succeeded in so quickly ridding himself of the snare-layer, and being again able to direct his thoughts to the problem of corporeal reality or unreality, he started on the return. Yet a side street misled him once to a wrong turn and took him, instead of to the west boundary, to the east end of the extensive old city-wall; buried in thought, he did not notice the mistake until he had come right up to a building which was neither the “Diomed” nor the “Hotel Suisse.” In spite of this it bore the sign of an hotel; near by he recognized the ruins of the large Pompeiian amphitheatre, and the memory came to him that near this latter there was another hotel, the “Albergo del Sole,” which, on account of its remoteness from the station, was sought out by only a few guests, and had remained unknown to even him. The walk had made him hot; besides, the cloudy whirling in his head had not diminished; so he stepped in through the open door and ordered the remedy deemed useful by him for blood congestion, a bottle of lime-water. The room stood empty except, of course, for the fly-visitors gathered in full numbers, and the unoccupied host availed himself of the opportunity to recommend highly his house and the excavated treasures it contained. He pointed suggestively to the fact that there were, near Pompeii, people at whose places there was not a single genuine piece among the many objects offered for sale, but that all were imitations, while he, satisfying himself with a smaller number, offered his guests only things undoubtedly genuine. For he acquired no articles which he himself had not seen brought to the light of day, and, in

the course of his eloquence, he revealed that he had also been present when they had found near the Forum the young lovers who had clasped each other in firm embrace when they realized their inevitable destruction, and had thus awaited death. Norbert had already heard of this discovery, but had shrugged his shoulders about it as a fabulous invention of some especially imaginative narrator, and he did so now, too, when the host brought in to him, as authentic proof, a metal brooch encrusted with green patina, which, in his presence, had been gathered with the remains of the girl from the ashes. When the arrival at the “Sun Hotel” took it in his own hand, however, the power of imagination exercised such ascendency over him that suddenly, without further critical consideration, he paid for it the price asked from English people, and, with his acquisition, hastily left the “Albergo del Sole,” in which, after another turn, he saw in an open window, nodding down, an asphodel branch covered with white blossoms, which had been placed in a water-glass; and without needing any logical connection, it rushed through his mind, at the sight of the grave-flower, that it was an attestation of the genuineness of his new possession.

This he viewed with mingled feelings of excitement and shyness, keeping now to the way along the city-wall to Porta Marina. Then it was no fairy tale that a couple of young lovers had been excavated near the Forum in such an embrace, and there at the Apollo temple he had seen Gradiva lie down to sleep, but only in a dream; that he knew now quite definitely; in reality she might have gone on still farther from the Forum, met some one and died with him.

From the green brooch between his fingers a feeling passed through him that it had belonged to Zoë-Gradiva, and had held her dress closed at the throat. Then she was the beloved fiancée, perhaps the young wife of him with whom she had wished to die.

It occurred to Norbert Hanold to hurl the brooch away. It burned his fingers as if it had become glowing, or more exactly, it caused him the pain such as he had felt at the idea that he might put his hand on that of Gradiva and encounter only empty air.

Reason, nevertheless, asserted the upper hand; he did not allow himself to be controlled by imagination against his will. However probable it might be, there was still lacking invincible proof that the brooch had belonged to her and that it had been she who had been discovered in the young man’s arms. This judgment made it possible for him to breathe

freely, and when at the dawn of twilight he reached the “Diomed,” his long wandering had brought to his sound constitution need of physical refreshment. Not without appetite did he devour the rather Spartan evening meal which the “Diomed,” in spite of its Argive origin, had adopted, and he then noticed two guests newly-arrived in the course of the afternoon. By appearance and language they marked themselves as Germans, a man and a woman; they both had youthful, attractive features endowed with intellectual expressions; their relation to each other could not be determined, yet, because of a certain resemblance, Norbert decided that they were brother and sister. To be sure the young man’s fair hair differed in colour from her light-brown tresses. In her gown she wore a red Sorrento rose, the sight of which, as he looked across from his corner, stirred something in his memory without his being able to think what it was. The couple were the first people he had met on his journey who seemed possibly congenial. They talked with one another, over a little bottle, in not too plainly audible tones, nor in cautious whisperings, apparently sometimes about serious things and sometimes about gay things, for at times there passed over her face a half-laughing expression which was very becoming to her, and aroused the desire to participate in their conversation, or perhaps might have awakened it in Norbert, if he had met them two days before in the room otherwise populated only by Anglo-Americans. Yet he felt that what was passing through his mind stood in too strong contrast to the happy naïveté of the couple about whom there undeniably lay not the slightest cloud, for they doubtless were not meditating profoundly over the essential nature of a girl who had died two thousand years ago, but, without any weariness, were taking pleasure in an enigmatical problem of their life of the present. His condition did not harmonize with that; on the one hand he seemed superfluous to them, and on the other, he recoiled from an attempt to start an acquaintance with them, for he had a dark feeling that their bright, merry eyes might look through his forehead into his thoughts and thereby assume an expression as if they did not consider him quite in his right mind. Therefore he went up to his room, stood, as yesterday, at the window, looking over to the purple night-mantle of Vesuvius, and then he lay down to rest. Exhausted, he soon fell asleep and dreamed, but remarkably nonsensically. Somewhere in the sun Gradiva sat making a trap out of a blade of grass in order to catch a lizard, and she said, “Please stay quite still — my

colleague is right; the method is really good, and she has used it with the greatest success."

Norbert Hanold became conscious in his dream that it was actually the most utter madness, and he cast about to free himself from it. He succeeded in this by the aid of an invisible bird, who seemingly uttered a short, merry call, and carried the lizard away in its beak; afterwards everything disappeared.

* * * * *

On awakening he remembered that in the night a voice had said that in the spring one gave roses, or rather this was recalled to him through his eyes, for his gaze, passing down from the window, came upon a bright bush of red flowers. They were of the same kind as those which the young lady had worn in her bosom, and when he went down he involuntarily plucked a couple and smelled of them. In fact, there must be something peculiar about Sorrento roses, for their fragrance seemed to him not only wonderful, but quite new and unfamiliar, and at the same time he felt that they had a somewhat liberating effect upon his mind. At least they freed him from yesterday's timidity before the gatekeepers, for he went, according to directions, in through the "ingresso" to Pompeii, paid double the amount of admission fee, and quickly struck out upon streets which took him from the vicinity of other visitors. The little sketch-book from the house of Meleager he carried along with the green brooch and the red roses, but the fragrance of the latter had made him forget to eat breakfast, and his thoughts were not in the present, but were directed exclusively to the noon hour, which was still far off; he had to pass the remaining interval, and for this purpose he entered now one house, now another, as a result of which activity the idea probably occurred to him that Gradiva had also walked there often before or even now sought these places out sometimes — his supposition that she was able to do it only at noon was tottering. Perhaps she was at liberty to do it in other hours of the day, possibly even at night in the moonlight. The roses strengthened this supposition strangely for him, when he inhaled, as he held them to his nose; and his deliberations, complaisant, and open to conviction, made advances to this new idea, for he could bear witness that he did not cling to preconceived opinions at all, but rather gave free rein to every reasonable

objection, and such there was here without any doubt, not only logically, but desirably valid. Only the question arose whether, upon meeting her then, the eyes of others could see her as a corporeal being, or whether only his possessed the ability to do that. The former was not to be denied, claimed even probability for itself, transformed the desirable thing into quite the opposite, and transported him into a low-spirited, restless mood. The thought that others might also speak to her and sit down near her to carry on a conversation with her made him indignant; to that he alone possessed a claim, or at any rate a privilege, for he had discovered Gradiva, of whom no one had formerly known, had observed her daily, taken her into his life, to a degree, imparted to her his life-strength, and it seemed to him as if he had thereby again lent to her life that she would not have possessed without him. Therefore he felt that there devolved upon him a right, to which he alone might make a claim, and which he might refuse to share with anyone else.

The advancing day was hotter than the two preceding; the sun seemed to have set her mind to-day on a quite extraordinary feat, and made it regrettable, not only in an archæological, but also in a practical connection, that the water system of Pompeii had lain burst and dried up for two thousand years. Street fountains here and there commemorated it and likewise gave evidence of their informal use by thirsty passers-by, who had, in order to bend forward to the jet, leaned a hand on the marble railing and gradually dug out a sort of trough in the place, in the same way that dropping wears away stone; Norbert observed this at a corner of the Strada della Fortuna, and from that the idea occurred to him that the hand of Zoë-Gradiva, too, might formerly have rested here in that way, and involuntarily he laid his hand into the little hollow, yet he immediately rejected the idea, and felt annoyance at himself that he could have done it; the thought did not harmonize at all with the nature and bearing of the young Pompeiian girl of a refined family; there was something profane in the idea that she could have bent over so and placed her lips on the very pipe from which the plebeians drank with coarse mouths. In a noble sense, he had never seen anything more seemly than her actions and movements; he was frightened by the idea that she might be able to see by looking at him that he had had the incredibly unreasonable thought, for her eyes possessed something penetrating; a couple of times, when he had been with her, the feeling had seized him that she looked as if she were seeking

for access to his inmost thoughts and were looking about them as if with a bright steel probe. He was obliged, therefore, to take great care that she might come upon nothing foolish in his mental processes.

It was now an hour until noon and in order to pass it, he went diagonally across the street into the Casa del Fauno, the most extensive and magnificent of all the excavated houses. Like no other, it possessed a double inner court and showed, in the larger one, on the middle of the ground, the empty base on which had stood the famous statue of the dancing faun after which the house had been named. Yet there stirred in Norbert Hanold not the least regret that this work of art, valued highly by science, was no longer here, but, together with the mosaic picture of the Battle of Alexander, had been transferred to the Museo Nazionale in Naples; he possessed no further intention nor desire than to let time move along, and he wandered about aimlessly in this place through the large building. Behind the peristyle opened a wider room, surrounded by numerous pillars, planned either as another repetition of the peristyle or as an ornamental garden; so it seemed at present for, like the dining-room of the Casa di Meleagro, it was completely covered with poppy-blooms. Absent-mindedly the visitor passed through the silent dereliction.

Then, however, he stopped and rested on one foot; but he found himself not alone here; at some distance his glance fell upon two figures, who first gave the impression of only one, because they stood as closely as possible to each other. They did not see him, for they were concerned only with themselves, and, in that corner, because of the pillars, might have believed themselves undiscoverable by any other eyes. Mutually embracing each other, they held their lips also pressed together, and the unsuspected spectator recognized, to his amazement, that they were the young man and woman who had last evening seemed to him the first congenial people encountered on this trip. For brother and sister, their present position, the embrace and the kiss, it seemed to him had lasted too long. So it was surely another pair of lovers, probably a young bridal couple, an Augustus and Gretchen, too.

Strange to relate, however, the two latter did not, at the moment, enter Norbert’s mind, and the incident seemed to him not at all ridiculous nor repulsive, rather it heightened his pleasure in them. What they were doing seemed to him as natural as it did comprehensible; his eyes clung to the living picture, more widely open than they ever had been to any of the

most admired works of art, and he would have gladly devoted himself for a longer time to his observation. Yet it seemed to him that he had wrongfully penetrated into a consecrated place and was on the point of disturbing a secret act of devotion; the idea of being noticed there struck terror to his heart, and he quickly turned, went back some distance noiselessly on tiptoe and, when he had passed beyond hearing distance, ran out with bated breath and beating heart to the Vicolo del Fauno.

* * * * *

When he arrived before the house of Meleager, he did not know whether it was already noon, and did not happen to question his watch about it, but remained before the door, standing looking down with indecision for some time at the “Ave” in the entrance. A fear prevented him from stepping in, and strangely, he was equally afraid of not meeting Gradiva within, and of finding her there; for, during the last few moments, he had felt quite sure that, in the first case, she would be staying somewhere else with some younger man, and, in the second case, the latter would be in company with her on the steps between the pillars. Toward the man, however, he felt a hate far stronger than against all the assembled common house-flies; until to-day he had not considered it possible that he could be capable of such violent inner excitement. The duel, which he had always considered stupid nonsense, suddenly appeared to him in a different light; here it became a natural right which the man injured in his own rights, or mortally insulted, made use of as the only available means to secure satisfaction or to part with an existence which had become purposeless. So he suddenly stepped forward to enter; he would challenge the bold man and would — this rushed upon him almost more powerfully — express unreservedly to her that he had considered her something better, more noble, and incapable of such vulgarity.

He was so filled to the brim with this rebellious idea that he uttered it, even though there was not apparently the least occasion for it, for, when he had covered the distance to the dining-room with stormy haste, he demanded violently, “Are you alone?” although appearances allowed of no doubt that Gradiva was sitting there on the steps, just as much alone as on the two previous days.

She looked at him amazed and replied, “Who should still be here after noon? Then the people are all hungry and sit down to meals. Nature has arranged that very happily for me.”

His surging excitement could not, however, be allayed so quickly, and without his knowledge or desire, he let slip, with the conviction of certainty, the conjecture which had come over him outside; for he added, to be sure somewhat foolishly, that he could really not think otherwise.

Her bright eyes remained fixed upon his face until he had finished. Then she made a motion with one finger against her brow and said, “You — —” After that, however, she continued, “It seems to me quite enough that I do not remain away from here, even though I must expect that you are coming here at this time; but the place pleases me, and I see that you have brought me my sketch-book that I forgot here yesterday. I thank you for your vigilance. Won’t you give it to me?” The last question was well founded, for he showed no disposition to do so, but remained motionless. It began to dawn upon him that he had imagined and worked out a monstrous piece of nonsense, and had also given expression to it; in order to compensate, as far as possible, he now stepped forward hastily, handed Gradiva the book, and at the same time sat down near her on the step, mechanically. Casting a glance at his hand, she said, “You seem to be a lover of roses.”

At these words he suddenly became conscious of what had caused him to pluck and bring them and he responded, “Yes, — of course, not for myself, have I — you spoke yesterday — and last night, too, some one said it to me — people give them in spring.”

She pondered briefly before she answered, “Ah, so — yes, I remember. To others, I meant, one does not give asphodel, but roses. That is polite of you; it seems your opinion of me is improved.”

Her hand stretched out to receive the red flowers, and, handing them to her, he rejoined, “I believed at first that you could be here only during the noon hour, but it has become probable to me that you also, at some other time — that makes me very happy — —”

“Why does it make you happy?”

Her face expressed lack of comprehension — only about her lips there passed a slight, hardly noticeable quiver. Confused, he offered, “It is beautiful to be alive; it has never seemed so much so to me before — I

wished to ask you?” He searched in his breast pocket and added, as he drew out the object, “Has this brooch ever belonged to you?”

She leaned forward a little toward it, but shook her head. “No, I can’t remember. Chronologically it would, of course, not be impossible, for it probably did not exist until this year. Did you find it in the sun perhaps? The beautiful green patina surely seems familiar to me, as if I had already seen it.”

Involuntarily he repeated, “In the sun? — why in the sun?”

“‘Sole’ it is called here. It brings to light many things of that sort. Was the brooch said to have belonged to a young girl who is said to have perished, I believe, in the vicinity of the Forum, with a companion?”

“Yes, who held his arm about her — —”

“Ah, so — —”

The two little words apparently lay upon Gradiva’s tongue as a favourite interjection, and she stopped after it for a moment before she added, “Did you think that on that account I might have worn it? and would that have made you a little — how did you say it before? — unhappy?”

It was apparent that he felt extraordinarily relieved and it was audible in his answer, “I am very happy about it — for the idea that the brooch belonged to you made me — dizzy.”

“You seem to have a tendency for that. Did you perhaps forget to eat breakfast this morning? That easily aggravates such attacks; I do not suffer from them, but I make provision, as it suits me best to be here at noon. If I can help you out of your unfortunate condition a little by sharing my lunch with you — —”

She drew out of her pocket a piece of white bread wrapped in tissue paper, broke it, put half into his hand, and began to devour the other with apparent appetite. Thereby her exceptionally dainty and perfect teeth not only gleamed between her lips with pearly glitter, but in biting the crust caused also a crunching sound so that they gave the impression of being not unreal phantoms, but of actual, substantial reality. Besides, with her conjecture about the postponed breakfast, she had, to be sure, hit upon the right thing; mechanically he, too, ate, and felt from it a decidedly favourable effect on the clearing of his thoughts. So, for a little while, the couple did not speak further, but devoted themselves silently to the same practical occupation until Gradiva said, “It seems to me as if we had

already eaten our bread thus together once two thousand years ago. Can't you remember it?"

He could not, but it seemed strange to him now that she spoke of so infinitely remote a past, for the strengthening of his mind by the nourishment had brought with it a change in his brain. The idea that she had been going around here in Pompeii such a long time ago would no longer harmonize with sound reason; everything about her seemed of the present, as if it could be scarcely more than twenty years old. The form and colour of her face, the especially charming, brown, wavy hair, and the flawless teeth; also, the idea that the bright dress, marred by no shadow of a spot, had lain countless years in the pumice ashes contained something in the highest degree inconsistent. Norbert was seized by a feeling of doubt whether he were really sitting here awake or were not more probably dreaming in his study, where, in contemplation of the likeness of Gradiva, he had been overcome by sleep, and had dreamed that he had gone to Pompeii, had met her as a person still living, and was dreaming further that he was still sitting so at her side in the Casa di Meleagro. For that she was really still alive or had been living again could only have happened in a dream — the laws of nature raised an objection to it ——

To be sure, it was strange that she had just said that she had once shared her bread with him in that way two thousand years ago. Of that he knew nothing, and even in the dream could find nothing about it.

Her left hand lay with the slender fingers calmly on her knees. They bore the key to the solution of an inscrutable riddle ——

Even in the dining-room of the Casa di Meleagro the boldness of the common house-fly was not deterred; on the yellow pillar opposite him he saw one running up and down in a worthless way in greedy quest; now it whizzed right past his nose.

He, however, had to make some answer to her question, if he did not remember the bread that he had formerly consumed with her, and he said suddenly, "Were the flies then as devilish as now, so that they tormented you to death?"

She glanced at him with utterly incomprehending astonishment and repeated, "The flies? Have you flies on your mind now?"

Then suddenly the black monster sat upon her hand, which did not reveal by the slightest quiver that she noticed it. Thereupon, however, there united in the young archæologist two powerful impulses to execute

the same deed. His hand went up suddenly and clapped with no gentle stroke on the fly and the hand of his neighbour.

With this blow there came to him, for the first time, sense, consternation and also a joyous fear. He had delivered the stroke not through empty air, but on an undoubtedly real, living and warm, human hand which, for a moment apparently absolutely startled, remained motionless under his. Yet then she drew it away with a jerk, and the mouth above it said, “You are surely apparently crazy, Norbert Hanold.”

The name, which he had disclosed to no one in Pompeii, passed so easily, assuredly and clearly from her lips that its owner jumped up from the steps, even more terrified. At the same time there sounded in the colonnade footsteps of people who had come near unobserved; before his confused eyes appeared the faces of the congenial pair of lovers from the Casa del Fauno, and the young lady cried, with a tone of greatest surprise, “Zoë! You here, too? and also on your honeymoon? You have not written me a word about it, you know.”

* * * * *

Norbert was again outside before Meleager’s house in the Strada di Mercurio. How he had come there was not clear to him, it must have happened instinctively, and, caused by a lightning-like illumination in him, was the only thing that he could do not to present a thoroughly ridiculous figure to the young couple, even more to the girl greeted so pleasantly by them, who had just addressed him by his Christian and family names, and most of all to himself. For even if he grasped nothing, one fact was indisputable. Gradiva, with a warm, human hand, not unsubstantial, but possessing corporeal reality, had expressed an indubitable truth; his mind had, in the last two days, been in a condition of absolute madness; and not at all in a silly dream, but rather with the use of eyes and ears such as is given by nature to man for reasonable service. Like everything else, how such a thing had happened escaped his understanding, and only darkly did he feel that there must have also been in the game a sixth sense which, obtaining the upper hand in some way, had transformed something perhaps precious to the opposite. In order to get at least a little more light on the matter by an attempt at meditation, a remote place in solitary silence was absolutely required; at first, however,

he was impelled to withdraw as quickly as possible from the sphere of eyes, ears and other senses, which use their natural functions as suits their own purpose.

As for the owner of that warm hand, she had, at any rate, from her first expression, been surprised by the unforeseen and unexpected visit at noon in the Casa di Meleagro in a not entirely pleasant manner. Yet, of this, in the next instant, there was no trace to be seen in her bright countenance; she stood up quickly, stepped toward the young lady and said, extending her hand, “It certainly is pleasant, Gisa; chance sometimes has a clever idea too. So this is your husband of two weeks? I am glad to see him, and, from the appearance of both of you, I apparently need not change my congratulations for condolence. Couples to whom that would be applied are at this time usually sitting at lunch in Pompeii; you are probably staying near the ‘ingresso’; I shall look you up there this afternoon. No, I have not written you anything; you won’t be offended at me for that, for you see my hand, unlike yours, is not adorned by a ring. The atmosphere here has an extremely powerful effect on the imagination, which I can see in you; it is better, of course, than if it made one too matter-of-fact. The young man who just went out is labouring also under a remarkable delusion; it seems to me that he believes a fly is buzzing in his head; well, everyone has, of course, some kind of bee in his bonnet. As is my duty, I have some knowledge of entomology and can, therefore, be of a little service in such cases. My father and I live in the ‘Sole’; he, too, had a sudden and pleasing idea of bringing me here with him if I would be responsible for my own entertainment, and make no demands upon him. I said to myself that I should certainly dig up something interesting alone here. Of course I had not reckoned at all on the find which I made — I mean the good fortune of meeting you, Gisa; but I am talking away the time, as is usually the case with an old friend —— My father comes in out of the sun at two o’clock to eat at the ‘Sole’; so I have to keep company there with his appetite and, therefore, I am sorry to say, must for the moment forego your society. You will, of course, be able to view the Casa di Meleagro without me; that I think likely, though I can’t understand it, of course. Favorisca, signor! Arrivederci, Gisetta! That much Italian I have already learned, and one really does not need more. Whatever else is necessary one can invent — please, no, senza complimenti!”

This last entreaty of the speaker concerned a polite movement by which the young husband had seemed to wish to escort her. She had expressed herself most vividly, naturally and in a manner quite fitting to the circumstances of the unexpected meeting of a close friend, yet with extraordinary celerity, which testified to the urgency of the declaration that she could not at present remain longer. So not more than a few minutes had passed since the hasty exit of Norbert Hanold, when she also stepped from the house of Meleager into the Strada di Mercurio. This lay, because of the hour, enlivened only here and there by a cringing lizard, and for a few moments the girl, hesitating, apparently gave herself over to a brief meditation. Then she quickly struck out in the shortest way to the gate of Hercules, at the intersection of the Vicolo di Mercurio and the Strada di Sallustio, crossed the stepping-stones with the gracefully buoyant Gradiva-walk, and thus arrived very quickly at the two ruins of the side wall near the Porta Ercolanese. Behind this there stretched at some length the Street of Tombs, yet not dazzlingly white, nor overhung with glittering sunbeams, as twenty-four hours ago, when the young archæologist had thus gazed down over it with searching eyes. To-day the sun seemed to be overcome by a feeling that she had done a little too much good in the morning; she held a grey veil drawn before her, the condensation of which was visibly being increased, and, as a result, the cypresses, which grew here and there in the Strada di Sepolcri, rose unusually sharp and black against the heavens. It was a picture different from that of yesterday; the brilliance which mysteriously glittered over everything was lacking; the street also assumed a certain gloomy distinctness, and had at present a dead aspect which honoured its name. This impression was not diminished by an isolated movement at its end, but was rather heightened by it; there, in the vicinity of the Villa of Diomede, a phantom seemed to be looking for its grave, and disappeared under one of the monuments.

It was not the shortest way from the house of Meleager to the “Albergo del Sole,” rather the exactly opposite direction, but Zoë-Gradiva must have also decided that time was not yet importuning so violently to lunch, for after a quite brief stop at the Hercules Gate, she walked farther along the lava-blocks of the Street of Tombs, every time raising the sole of her lingering foot almost perpendicularly.

* * * * *

The Villa of Diomede — named thus, for people of the present, after a monument which a certain freed-man, Marcus Arrius Diomedes, formerly promoted to the directorship of this city-section, had erected near by for his lady, Arria, as well as for himself and his relatives — was a very extensive building and concealed within itself a part of the history of the destruction of Pompeii not invented by imagination. A confusion of extensive ruins formed the upper part; below lay an unusually large sunken garden surrounded by a well-preserved portico of pillars with scanty remnants of a fountain and a small temple in the middle; and farther along two stairways led down to a circular cellar-vault, lighted only dimly by gloomy twilight. The ashes of Vesuvius had penetrated into this also, and the skeletons of eighteen women and children had been found here; seeking protection they had fled, with some hastily gathered provisions, into the half-subterranean space, and the deceptive refuge had become the tomb of all. In another place the supposed, nameless master of the house lay, also stretched out choked on the ground; he had wished to escape through the locked garden-door, for he held the key to it in his fingers. Beside him cowered another skeleton, probably that of a servant, who was carrying a considerable number of gold and silver coins. The bodies of the unfortunates had been preserved by the hardened ashes; in the museum at Naples there is under glass, the exact impression of the neck, shoulders and beautiful bosom of a young girl clad in a fine, gauzy garment.

The Villa of Diomede had, at one time, at least, been the inevitable goal of every dutiful Pompeii visitor, but now, at noon, in its rather roomy solitude, certainly no curiosity lingered in it, and therefore it had seemed to Norbert Hanold the place of refuge best suited to his newest mental needs. These longed most insistently for grave-like loneliness, breathless silence, and quiescent peace; against the latter, however, an impelling restlessness in his system raised counter-claims, and he had been obliged to force an agreement between the two demands, such that the mind tried to claim its own and yet gave the feet liberty to follow their impulse. So he had been wandering around through the portico since his entrance; he succeeded thus in preserving his bodily equilibrium, and he busied himself with changing his mental state into the same normal condition; that, however, seemed more difficult in execution than in intention; of course it

seemed to his judgment unquestionable that he had been utterly foolish and irrational to believe that he had sat with a young Pompeiian girl, who had become more or less corporeally alive again, and this clear view of his madness formed incontestably an essential advance on the return to sound reason; but it was not yet restored entirely to normal condition, for, even if it had occurred to him that Gradiva was only a dead bas-relief, it was also equally beyond doubt that she was still alive. For that irrefutable proof was adduced; not he alone, but others also, saw her, knew that her name was Zoë and spoke with her, as with a being as much alive, in substance, as they. On the other hand, however, she knew his name too, and again, that could originate only from a supernatural power; this dual nature remained enigmatic even for the rays of understanding that were entering his mind. Yet to this incompatible duality there was joined a similar one in him, for he cherished the earnest desire to have been destroyed here in the Villa of Diomede two thousand years ago, in order that he might not run the risk of meeting Zoë-Gradiva again anywhere; at the same time, however, an extraordinary joyous feeling was stirring within him, because he was still alive and was therefore able to meet her again somewhere. To use a commonplace yet fitting simile, this was turning in his head like a mill-wheel, and through the long portico he ran around likewise without stopping, which did not aid him in the explanation of the contradictions. On the contrary, he was moved by an indefinite feeling that everything was growing darker and darker about and within him.

Then he suddenly recoiled, as he turned one of the four corners of the colonnade. A half-dozen paces away from him there sat, rather high up on a fragmentary wall-ruin, one of the young girls who had found death here in the ashes.

No, that was nonsense, which his reason rejected. His eyes, too, and a nameless something else recognized that fact. It was Gradiva; she was sitting on a stone ruin as she had formerly sat on the step, only, as the former was considerably higher, her slender feet, which hung down free in the sand-colour shoes, were visible up to her dainty ankles.

With an instinctive movement, Norbert was at first about to run out between the pillars through the garden; what, for a half-hour, he had feared most of anything in the world had suddenly appeared, viewed him with bright eyes and with lips which, he felt, were about to burst into mocking

laughter; yet they didn’t, but the familiar voice rang out calmly from them, “You’ll get wet outside.”

Now, for the first time, he saw that it was raining; for that reason it had become so dark. That unquestionably was an advantage to all the plants about and in Pompeii, but that a human being in the place would be benefited by it was ridiculous, and for the moment Norbert Hanold feared, far more than danger of death, appearing ridiculous. Therefore he involuntarily gave up the attempt to get away, stood there, helpless, and looked at the two feet, which now, as if somewhat impatient, were swinging back and forth; and as this view did not have so clearing an effect upon his thoughts that he could find expression for them, the owner of the dainty feet again took up the conversation. “We were interrupted before; you were just going to tell me something about flies — I imagined that you were making scientific investigations here — or about a fly in your head. Did you succeed in catching and destroying the one on my hand?”

This last she said with a smiling expression about her lips, which, however, was so faint and charming that it was not at all terrifying. On the contrary, it now lent to the questioned man power of speech, but with this limitation, that the young archæologist suddenly did not know how to address her. In order to escape this dilemma, he found it best to avoid that and replied, “I was — as they say — somewhat confused mentally and ask pardon that I — the hand — in that way — how I could be so stupid, I can’t understand — but I can’t understand either how its owner could use my name in upbraiding me for my — my madness.”

Gradiva’s feet stopped moving and she rejoined, still addressing him familiarly, “Your power of understanding has not yet progressed that far, Norbert Hanold. Of course, I cannot be surprised, for you have long ago accustomed me to it. To make that discovery again I should not have needed to come to Pompeii, and you could have confirmed it for me a good hundred miles nearer.”

“A hundred miles nearer” — he repeated, perplexed and half stuttering — “where is that?”

“Diagonally across from your house, in the corner house; in my window, in a cage, is a canary.”

Like a memory from far away this last word moved the hearer, who repeated, “A canary” — and he added, stuttering more— “He — he

sings?”

“They usually do, especially in spring when the sun begins to seem warm again. In that house lives my father, Richard Bertgang, professor of zoology.”

Norbert Hanold’s eyes opened to a width never before attained by them, and then he said, “Bertgang — then are you — are you — Miss Zoë Bertgang? But she looked quite different — —”

The two dangling feet began again to swing a little, and Miss Zoë Bertgang said in reply, “If you find that form of address more suitable between us, I can use it too, you know, but the other came to me more naturally. I don’t know whether I looked different when we used to run about before with each other as friends every day, and occasionally beat and cuffed each other, for a change, but if, in recent years, you had favoured me with even one glance, you might perhaps have seen that I have looked like this for a long time. — No, now, as they say, it’s pouring pitchforks; you won’t have a dry stitch.”

Not only had the feet of the speaker indicated a return of impatience, or whatever it might be, but also in the tones of her voice there appeared a little didactic, ill-humoured curtness, and Norbert had thereby been overwhelmed by a feeling that he was running the risk of slipping into the rôle of a big school-boy scolded and slapped in the face. That caused him to again seek mechanically for an exit between the pillars, and to the movement which showed this impulse Miss Zoë’s last utterance, indifferently added, had reference; and, of course, in an undeniably striking way, because for what was now occurring outside of the shelter, “pouring” was really a mild term. A tropical cloudburst such as only seldom took pity on the summer thirst of the meadows of the Campagna, was shooting vertically and rushing as if the Tyrrhenian Sea were pouring from heaven upon the Villa of Diomede, and yet it continued like a firm wall composed of billions of drops gleaming like pearls and large as nuts. That, indeed, made escape out into the open air impossible, and forced Norbert Hanold to remain in the school-room of the portico while the young school-mistress with the delicate, clever face made use of the hindrance for further extension of her pedagogical discussion by continuing, after a brief pause: —

“Then up to the time when people call us ‘Backfisch,’ for some unknown reason, I had really acquired a remarkable attachment for you

and thought that I could never find a more pleasing friend in the world. Mother, sister, or brother I had not, you know; to my father a slow-worm in alcohol was far more interesting than I, and people (I count girls such) must surely have something with which they can occupy their thoughts and the like. Then you were that something, but when archæology overcame you, I made the discovery that you — excuse the familiarity, but your new formality sounds absurd to me — I was saying that I imagined that you had become an intolerable person, who had no longer, at least for me, an eye in his head, a tongue in his mouth, nor any of the memories that I retained of our childhood friendship. So I probably looked different from what I did formerly, for when, occasionally, I met you at a party, even last winter, you did not look at me and I did not hear your voice; in this, of course, there was nothing which marked me out especially, for you treated all the others in the same way. To you I was but air, and you, with your shock of light hair, which I had formerly pulled so often, were as boresome, dry and tongue-tied as a stuffed cockatoo and at the same time as grandiose as an — archæopteryx; I believe the excavated, antediluvian bird-monster is so called; but that your head harboured an imagination so magnificent as here in Pompeii to consider me something excavated and restored to life — I had not surmised that of you, and when you suddenly stood before me unexpectedly, it cost me some effort at first to understand what kind of incredible fancy your imagination had invented. Then I was amused, and, in spite of its madness, it was not entirely displeasing to me. For, as I said, I had not expected it of you.”

With that, her expression and tone somewhat mollified at the end, Miss Zoë Bertgang finished her unreserved, detailed and instructive lecture, and it was indeed notable how exactly she then resembled the figure of Gradiva on the bas-relief, not only in her features, her form, her eyes, expressive of wisdom, and her charmingly wavy hair, but also in her graceful manner of walking which he had often seen; her drapery, too, dress and scarf of a cream-coloured, fine cashmere material which fell in soft, voluminous folds, completed the extraordinary resemblance of her whole appearance. There might have been much foolishness in the belief that a young Pompeiian girl, destroyed two thousand years ago by Vesuvius, could sometimes walk around alive again, speak, draw and eat bread, but even if the belief brought happiness, it assumed everywhere, in the bargain, a considerable amount of incomprehensibility; and in

consideration of all the circumstances, there was incontestably present, in the judgment of Norbert Hanold, some mitigating ground for his madness in for two days considering Gradiva a resurrection.

Although he stood there dry under the portico roof, there was established, not quite ineptly, a comparison between him and a wet poodle, who has had a bucketful of water thrown on his head; but the cold shower-bath had really done him good. Without knowing exactly why, he felt that he was breathing much more easily. In that, of course, the change of tone at the end of the sermon — for the speaker sat as if in a pulpit-chair — might have helped especially; at least thereat a transfigured light appeared in his eyes, such as awakened hope for salvation through faith produces in the eyes of an ardently affected church-attendant; and as the rebuke was now over, and there seemed no necessity for fearing a further continuation, he succeeded in saying, “Yes, now I recognize — no, you have not changed at all — it is you, Zoë — my good, happy, clever comrade — it is most strange — —”

“That a person must die to become alive again; but for archæologists that is of course necessary.”

“No, I mean your name — —”

“Why is it strange?”

The young archæologist showed himself familiar with not only the classical languages, but also with the etymology of German, and continued, “Because Bertgang has the same meaning as Gradiva and signifies ‘the one splendid in walking.’”

Miss Zoë Bertgang’s two sandal-like shoes were, for the moment, because of their movement, reminiscent of an impatiently see-sawing wagtail waiting for something; yet the possessor of the feet which walked so magnificently seemed not at present to be paying any attention to philological explanations; by her countenance she gave the impression of being occupied with some hasty plan, but was restrained from it by an exclamation of Norbert Hanold’s which audibly emanated from deepest conviction, “What luck, though, that you are not Gradiva, but are like the congenial young lady!”

That caused an expression as of interested surprise to pass over her face, and she asked, “Who is that? Whom do you mean?”

“The one who spoke to you in Meleager’s house.”

“Do you know her?”

“Yes, I had already seen her. She was the first person who seemed especially congenial to me.”

“So? Where did you see her?”

“This morning, in the House of the Faun. There the couple were doing something very strange.”

“What were they doing?”

“They did not see me and they kissed each other.”

“That was really very reasonable, you know. Why else are they in Pompeii on their wedding trip?”

At one blow with the last word the former picture changed before Norbert Hanold’s eyes, for the old wall-ruin lay there empty, because the girl, who had chosen it as a seat, teacher’s chair and pulpit, had come down, or really flown, and with the same supple buoyancy as that of a wagtail swinging through the air, so that she already stood again on Gradiva-feet, before his glance had consciously caught up with her descent; and continuing her speech directly, she said, “Well, the rain has stopped; too severe rulers do not reign long. That is reasonable, too, you know, and thus everything has again become reasonable. I, not least of all, and you can look up Gisa Hartleben, or whatever new name she has, to be of scientific assistance to her about the purpose of her stay in Pompeii. I must now go to the ‘Albergo del Sole,’ for my father is probably waiting for me already at lunch. Perhaps we shall meet again sometime at a party in Germany or on the moon. Addio!”

Zoë Bertgang said this in the absolutely polite, but also equally indifferent tone of a most well-bred young lady, and, as was her custom, placing her left foot forward, raised the sole of the right almost perpendicularly to pass out. As she lifted her dress slightly with her left hand, because of the thoroughly wet ground outside, the resemblance to Gradiva was perfect and the man, standing hardly more than two arm-lengths away, noticed for the first time a quite insignificant deviation in the living picture from the stone one. The latter lacked something possessed by the former, which appeared at the moment quite clear, a little dimple in her cheek, which produced a slight, indefinable effect. It puckered and wrinkled a little and could therefore express annoyance or a suppressed impulse to laugh, possibly both together. Norbert Hanold looked at it and although from the evidence just presented to him he had completely regained his reason, his eyes had to again submit to an optical

illusion. For, in a tone triumphing peculiarly over his discovery, he cried out, “There is the fly again!”

It sounded so strange that from the incomprehending listener, who could not see herself, escaped the question, “The fly — where?”

“There on your cheek!” and immediately the man, as he answered, suddenly twined an arm about her neck and snapped, this time with his lips, at the insect so deeply abhorrent to him, which vision juggled before his eyes deceptively in the little dimple. Apparently, however, without success, for right afterwards he cried again, “No, now it’s on your lips!” and thereupon, quick as a flash, he directed thither his attempt to capture, now remaining so long that no doubt could survive that he succeeded in completely accomplishing his purpose, and strange to relate the living Gradiva did not hinder him at all, and when her mouth, after about a minute, was forced to struggle for breath, restored to powers of speech, she did not say, “You are really crazy, Norbert Hanold,” but rather allowed a most charming smile to play more visibly than before about her red lips; she had been convinced more than ever of the complete recovery of his reason.

The Villa of Diomede had two thousand years ago seen and heard horrible things in an evil hour, yet at the present it heard and saw, for about an hour, only things not at all suited to inspire horror. Then, however, a sensible idea became uppermost in Miss Zoë Bertgang’s mind and as a result, she said, against her wishes, “Now, I must *really* go, or my poor father will starve. It seems to me you can to-day forego Gisa Hartleben’s company at noon, for you have nothing more to learn from her and ought to be content with us in the ‘Sun Hotel.’”

From this it was to be concluded that daring that hour something must have been discussed, for it indicated a helpful desire to instruct, which the young lady vented on Norbert. Yet, from the reminding words, he did not gather this, but something which, for the first time, he was becoming terribly conscious of; this was apparent in the repetition, “Your father — what will he —— ?”

Miss Zoë, however, interrupted, without any sign of awakened anxiety, “Probably he will do nothing; I am not an indispensable piece in his zoological collection; if I were, my heart would probably not have clung to you so unwisely. Besides, from my early years, I have been sure that a woman is of use in the world only when she relieves a man of the trouble

of deciding household matters; I generally do this for my father, and therefore you can also be rather at ease about your future. Should he, however, by chance, in this case, have an opinion different from mine, we will make it as simple as possible. You go over to Capri for a couple of days; there, with a grass snare — you can practise making them on my little finger — catch a lizard *Faraglionensis*. Let it go here again, and catch it before his eyes. Then give him free choice between it and me, and you will have me so surely that I am sorry for you. Toward his colleague, Eimer, however, I feel to-day that I have formerly been ungrateful, for without his genial invention of lizard-catching I should probably not have come into Meleager's house, and that would have been a shame, not only for you, but for me too."

This last view she expressed outside of the Villa of Diomede and, alas, there was no person present on earth who could make any statements about the voice and manner of talking of Gradiva. Yet even if they had resembled those of Zoë Bertgang, as everything else about her did, they must have possessed a quite unusually beautiful and roguish charm.

By this, at least, Norbert Hanold was so strongly overwhelmed that, exalted to poetic flights, he cried out, "Zoë, you dear life and lovely present — we shall take our wedding-trip to Italy and Pompeii."

That was a decided proof of how different circumstances can also produce a transformation in a human being and at the same time unite with it a weakening of the memory. For it did not occur to him at all that he would thereby expose himself and his companion on the journey to the danger of receiving, from misanthropic, ill-humoured railway companions, the names Augustus and Gretchen, but at the moment he was thinking so little about it that they walked along hand in hand through the old Street of Tombs in Pompeii. Of course this, too, did not stamp itself into their minds at present as such, for a cloudless sky shone and laughed again above it; the sun stretched out a golden carpet on the old lava-blocks; Vesuvius spread its misty pine-cone; and the whole excavated city seemed overwhelmed, not with pumice and ashes, but with pearls and diamonds, by the beneficent rain-storm.

The brilliance in the eyes of the young daughter of the zoologist rivalled these, but to the announced desire about the destination of their journey by her childhood friend who had, in a way, also been excavated from the ashes, her wise lips responded: "I think we won't worry about

that to-day; that is a thing which may better be left by both of us to more and maturer consideration and future promptings. I, at least, do not yet feel quite alive enough now for such geographical decisions."

That showed that the speaker possessed great modesty about the quality of her insight into things about which she had never thought until to-day. They had arrived again at the Hercules Gate, where, at the beginning of the Strada Consolare, old stepping-stones crossed the street. Norbert Hanold stopped before them and said with a peculiar tone, "Please go ahead here." A merry, comprehending, laughing expression lurked around his companion's mouth, and, raising her dress slightly with her left hand, Gradiva *rediviva* Zoë Bertgang, viewed by him with dreamily observing eyes, crossed with her calmly buoyant walk, through the sunlight, over the stepping-stones, to the other side of the street.

PART II. DELUSION AND DREAM

IN

WILHELM JENSEN'S *GRADIVA*

BY

DR. SIGMUND FREUD

DELUSION AND DREAM

I

In a circle of men who take it for granted that the basic riddle of the dream has been solved by the efforts of the present writer, curiosity was aroused one day concerning those dreams which have never been dreamed, those created by authors, and attributed to fictitious characters in their productions. The proposal to submit this kind of dream to investigation might appear idle and strange; but from one view-point it could be considered justifiable. It is, to be sure, not at all generally believed that the dreamer dreams something senseful and significant. Science and the majority of educated people smile when one offers them the task of interpreting dreams. Only people still clinging to superstition, who give continuity, thereby, to the convictions of the ancients, will not refrain from interpreting dreams, and the writer of *Traumdeutung* has dared, against the protests of orthodox science, to take sides with the ancients and superstitious. He is, of course, far from accepting in dreams a prevision of the future, for the disclosure of which man has, from time immemorial, striven vainly. He could not, however, completely reject the connections of dreams with the future, for, after completing some arduous analysis, the dreams seemed to him to represent *the fulfilment of a wish* of the dreamer; and who could dispute that wishes are preponderantly concerned with the future?

I have just said that the dream is a fulfilled wish. Whoever is not afraid to toil through a difficult book, whoever does not demand that a complicated problem be insincerely and untruthfully presented to him as

easy and simple, to save his own effort, may seek in the above-mentioned *Traumdeutung* ample proof of this statement, and may, until then, cast aside the objection that will surely be expressed against the equivalence of dreams and wish-fulfilment.

We have, however, anticipated. The question is not now one of establishing whether the meaning of a dream is, in every case, to be interpreted as the fulfilment of a wish, or, just as frequently, as an anxious expectation, an intention or deliberation, etc. The first question is, rather, whether the dream has any meaning at all, whether one should grant it the value of a psychic process. Science answers, *No*; it explains the dream as a purely physiological process, behind which one need not seek meaning, significance nor intention. Physical excitations play, during sleep, on the psychic instrument and bring into consciousness sometimes some, sometimes other ideas devoid of psychic coherence. Dreams are comparable only to convulsions, not to expressive movements.

In this dispute over the estimation of dreams, writers seem to stand on the same side with the ancients, superstitious people and the author of *Traumdeutung*. For, when they cause the people created by their imagination to dream, they follow the common experience that people's thoughts and feelings continue into sleep, and they seek only to depict the psychic states of their heroes through the dreams of the latter. Story-tellers are valuable allies, and their testimony is to be rated high, for they usually know many things between heaven and earth that our academic wisdom does not even dream of. In psychic knowledge, indeed, they are far ahead of us ordinary people, because they draw from sources that we have not yet made accessible for science. Would that this partizanship of literary workers for the senseful nature of dreams were only more unequivocal! Sharper criticism might object that writers take sides neither for nor against the psychic significance of an isolated dream; they are satisfied to show how the sleeping psyche stirs under the stimuli which have remained active in it as off-shoots of waking life.

Our interest for the way in which story-tellers make use of dreams is not, however, made less intense by this disillusionment. Even if the investigation should teach nothing of the nature of dreams, it may perhaps afford us, from this angle, a little insight into the nature of creative literary production. Actual dreams are considered to be unrestrained and irregular formations, and now come the free copies of such dreams; but there is

much less freedom and arbitrariness in psychic life than we are inclined to believe, perhaps none at all. What we, laity, call chance resolves itself, to an acknowledged degree, into laws; also, what we call arbitrariness in psychic life rests on laws only now dimly surmised. Let us see!

There are two possible methods for this investigation; one is engrossment with a special case, with the dream-creations of one writer in one of his works; the other consists in bringing together and comparing all the examples of the use of dreams which are found in the works of different story-tellers. The second way seems to be by far the more effective, perhaps the only justifiable one, for it frees us immediately from the dangers connected with the conception of "the writer" as an artistic unity. This unity falls to pieces in investigations of widely different writers, among whom we are wont to honour some, individually, as the most profound connoisseurs of psychic life. Yet these pages will be filled by an investigation of the former kind. It so happened, in the group of men who started the idea, that some one remembered that the bit of fiction which he had most recently enjoyed contained several dreams which looked at him with familiar expression and invited him to try on them the method of *Traumdeutung*. He admitted that the material and setting of the little tale had been partly responsible for the origin of his pleasure, for the story was unfolded in Pompeii, and concerned a young archæologist who had given up interest in life, for that in the remains of the classic past, and now, by a remarkable but absolutely correct détour, was brought back to life. During the perusal of this really poetic material, the reader experienced all sorts of feelings of familiarity and concurrence. The tale was Wilhelm Jensen's *Gradiva,* a little romance designated by its author himself "A Pompeian Fancy."

In order that my further references may be to familiar material, I must now ask my readers to lay aside this pamphlet, and replace it for some time with *Gradiva*, which first appeared in the book world in 1903. To those who have already read *Gradiva,* I will recall the content of the story in a short epitome, and hope that their memory will of itself restore all the charm of which the story is thereby stripped.

A young archæologist, Norbert Hanold, has discovered at Rome, in a collection of antiques, a bas-relief which attracts him so exceptionally that he is delighted to be able to get an excellent plaster-cast of it which he can hang up in his study in a German university-city and study with interest.

The relief represents a mature young girl walking. She has gathered up her voluminous gown slightly, so that her sandalled feet become visible. One foot rests wholly on the ground; the other is raised to follow and touches the ground only with the tips of the toes while sole and heel rise almost perpendicularly. The unusual and especially charming walk represented had probably aroused the artist's attention, and now, after so many centuries, captivates the eye of our archæological observer.

This interest of the hero in the described bas-relief is the basic psychological fact of our story. It is not immediately explicable. "Doctor Norbert Hanold, docent of archæology, really found in the relief nothing noteworthy for his science." (*Gradiva*, .) "He could not explain what quality in it had aroused his attention; he knew only that he had been attracted by something and this effect of the first view had remained unchanged since then," but his imagination does not cease to be occupied with the relief. He finds in it a "sense of present time," as if the artist had fixed the picture on the street "from life." He confers upon the girl represented walking a name, Gradiva, "the girl splendid in walking," spins a yarn that she is the daughter of a distinguished family, perhaps of a "patrician ædile, whose office was connected with the worship of Ceres," and is on the way to the temple of the goddess. Then it is repulsive to him to place her in the mob of a metropolis; rather he convinces himself that she is to be transported to Pompeii, and is walking there somewhere on the peculiar stepping-stones which have been excavated; these made a dry crossing possible in rainy weather, and yet also afforded passage for chariot-wheels. The cut of her features seems to him Greek, her Hellenic ancestry unquestionable. All of his science of antiquity gradually puts itself at the service of this or other fancies connected with the relief.

Then, however, there obtrudes itself upon him a would-be scientific problem which demands solution. Now it is a matter of his passing a critical judgment "whether the artist had reproduced Gradiva's manner of walking from life." He cannot produce it in himself; in the search for the "real existence" of this gait, he arrives only at "observation from life for the purpose of enlightenment on the matter" (G.). This forces him, to be sure, to a mode of action utterly foreign to him. "Women had formerly been for him only a conception in marble or bronze, and he had never given his feminine contemporaries the least consideration." Society life has always seemed to him an unavoidable torture; young ladies whom he

meets, in such connections, he fails to see and hear, to such a degree that, on the next encounter, he passes without greeting, which, of course, serves to place him in an unfavourable light with them. Now, however, the scientific task which he has imposed upon himself forces him in dry weather, but especially in wet weather, to observe diligently the feet of ladies and girls on the street, an activity which yields him many a displeased and many an encouraging glance from those observed. “Yet one was as incomprehensible to him as the other.” (G. .) As a result of these careful studies, he finds that Gradiva’s gait cannot be proved to exist really, a fact which fills him with regret and annoyance.

Soon afterwards he has a terribly frightful dream, which transports him to old Pompeii on the day of the eruption of Vesuvius, and makes him an eye-witness of the destruction of the city. “As he stood thus at the edge of the Forum near the Jupiter temple, he suddenly saw Gradiva a short distance in front of him. Until then no thought of her presence there had moved him, but now suddenly it seemed natural to him, as she was, of course, a Pompeiian girl, that she was living in her native city and, *without his having any suspicion of it, was his contemporary*.” (G. .) Fear about her impending fate draws from him a cry of warning, in answer to which the unperturbed apparition turns her face toward him. Unconcerned, she continues her way to the portico of the temple, sits down there on a step and slowly rests her head upon it, while her face keeps growing paler, as if it were turning to white marble. As he hastens after her, he finds her, with calm countenance, stretched out, as if sleeping, on the broad step; soon the rain of ashes buries her form.

When he awakes, he thinks he is still hearing the confused cries of the Pompeiians, who are seeking safety, and the dully resounding boom of the turbulent sea; but even after his returning senses have recognized these noises as the waking expressions of life in the noisy metropolis, he retains for some time the belief in the reality of what he has dreamed; when he has finally rid himself of the idea that he was really present, nearly two thousand years ago, at the destruction of Pompeii, there yet remains to him, as a firm conviction, the idea that Gradiva lived in Pompeii and was buried there in the year 79. His fancies about Gradiva, due to the after-effects of this dream, continue so that he now, for the first time, begins to mourn her as lost.

While he leans from his window, prepossessed with these ideas, a canary, warbling his song in a cage at an open window of the house opposite, attracts his attention. Suddenly something like a thrill passes through the man not yet completely awakened from his dream. He believes that he sees, in the street, a figure like that of his Gradiva, and even recognizes the gait characteristic of her; without deliberation he hastens to the street to overtake her, and the laughter and jeers of the people, at his unconventional morning attire, first drive him quickly back home. In his room, it is again the singing canary in the cage who occupies him and stimulates him to a comparison with himself. He, too, is sitting in a cage, he finds, yet it is easier for him to leave his cage. As if from added after-effect of the dream, perhaps also under the influence of the mild spring air, he decides to take a spring trip to Italy, for which a scientific motive is soon found, even if "the impulse for travel had originated in a nameless feeling" (G.).

We will stop a moment at this most loosely motivated journey and take a closer look at the personality, as well as the activities of our hero. He seems to us still incomprehensible and foolish; we have no idea of how his special folly is to acquire enough human appeal to compel our interest. It is the privilege of the author of *Gradiva* to leave us in such a quandary; with his beauty of diction and his judicious selection of incident, he presently rewards our confidence and the undeserved sympathy which we still grant to his hero. Of the latter we learn that he is already destined by family tradition to be an antiquarian, has later, in isolation and independence, submerged himself completely in his science, and has withdrawn entirely from life and its pleasures. Marble and bronze are, for his feelings, the only things really alive and expressing the purpose and value of human life. Yet, perhaps with kind intent, Nature has put into his blood a thoroughly unscientific sort of corrective, a most lively imagination, which can impress itself not only on his dreams, but also on his waking life. By such separation of imagination and intellectual capacity, he is destined to be a poet or a neurotic, and he belongs to that race of beings whose realm is not of this world. So it happens that his interest is fixed upon a bas-relief which represents a girl walking in an unusual manner, that he spins a web of fancies about it, invents a name and an ancestry for it, and transports the person created by him into Pompeii, which was buried more than eighteen hundred years ago. Finally, after a

remarkable anxiety-dream he intensifies the fancy of the existence and destruction of the girl named Gradiva into a delusion which comes to influence his acts. These performances of imagination would appear to us strange and inscrutable, if we should encounter them in a really living person. As our hero, Norbert Hanold, is a creature of an author, we should like to ask the latter timidly if his fancy has been determined by any power other than his own arbitrariness.

We left our hero just as he is apparently being moved by the song of a canary to take a trip to Italy, the motive for which is apparently not clear to him. We learn, further, that neither destination nor purpose are firmly established in his mind. An inner restlessness and dissatisfaction drive him from Rome to Naples and farther on from there; he encounters the swarm of honeymoon travellers, and, forced to notice the tender "Augustuses" and "Gretchens," is utterly unable to understand the acts and impulses of the couples. He arrives at the conclusion that, of all the follies of humanity, "marriage, at any rate, took the prize as the greatest and most incomprehensible one, and the senseless wedding trips to Italy somehow capped the climax of this buffoonery." (G. .) At Rome, disturbed in his sleep by the proximity of a loving couple, he flees, forthwith, to Naples, only to find there another "Augustus" and "Gretchen." As he believes that he understands from their conversation that the majority of those bird-couples does not intend to nest in the rubbish of Pompeii, but to take flight to Capri, he decides to do what they do not do, and finds himself in Pompeii, "contrary to expectations and intentions," a few days after the beginning of his journey — without, however, finding there the peace which he seeks.

The rôle which, until then, has been played by the honeymoon couples, who made him uneasy and vexed his senses, is now assumed by house-flies, in which he is inclined to see the incarnation of absolute evil and worthlessness. The two tormentors blend into one; many fly-couples remind him of honeymoon travellers, address each other probably, in their language, also as "My only Augustus" and "My sweet Gretchen."

Finally he cannot help admitting "that his dissatisfaction was certainly caused not by his surroundings alone, but to a degree found its origin in him." (G. .) He feels that he is out of sorts because he lacks something without being able to explain what.

The next morning he goes through the “ingresso” to Pompeii and, after taking leave of the guide, roams aimlessly through the city, notably, however, without remembering that he has been present in a dream some time before at the destruction of Pompeii. Therefore in the “hot, holy” hour of noon, which the ancients, you know, considered the ghost-hour, when the other visitors have taken flight and the heap of ruins, desolate and steeped in sunlight, lies before him, there stirs in him the ability to transport himself back into the buried life, but not with the aid of science. “What it taught was a lifeless, archæological view and what came from its mouth was a dead, philological language. These helped in no way to a comprehension with soul, mind and heart, as the saying is, but he, who possessed a desire for that, had to stand alone here, the only living person in the hot noonday silence, among the remains of the past, in order not to see with physical eyes nor hear with corporeal ears. Then — the dead awoke, and Pompeii began to live again.” (G. .) While thus, by means of his imagination, he endows the past with life, he suddenly sees, indubitably, the Gradiva of his bas-relief step out of a house and buoyantly cross the lava stepping-stones, just as he had seen her in the dream that night when she had lain down to sleep on the steps of the Apollo temple. “With this memory he became conscious, for the first time, of something else; he had, without himself knowing the motive in his heart, come to Italy on that account, and had, without stop, continued from Rome and Naples to Pompeii to see if he could here find trace of her — and that in a literal sense — for, with her unusual gait, she must have left behind in the ashes a foot-print different from all the others.” (G. .)

The suspense, in which the author of *Gradiva* has kept us up to this point, mounts here, for a moment, to painful confusion. Not only because our hero has apparently lost his equilibrium, but also because, confronted with the appearance of Gradiva, who was formerly a plaster-cast and then a creation of imagination, we are lost. Is it a hallucination of our deluded hero, a “real” ghost, or a corporeal person? Not that we need to believe in ghosts to draw up this list. Jensen, who named his tale a “Fancy,” has, of course, found no occasion, as yet, to explain to us whether he wishes to leave us in our world, decried as dull and ruled by the laws of science, or to conduct us into another fantastic one, in which reality is ascribed to ghosts and spirits. As *Hamlet* and *Macbeth* show, we are ready to follow him into such a place without hesitation. The delusion of the imaginative

archæologist would need, in that case, to be measured by another standard. Yes, when we consider how improbable must be the real existence of a person who faithfully reproduces in her appearance that antique bas-relief, our list shrinks to an alternative: hallucination or ghost of the noon hour. A slight touch in the description eliminates the former possibility. A large lizard lies stretched out, motionless, in the sunlight; it flees, however, before the approaching foot of Gradiva and wriggles away over the lava pavement. So, no hallucination; something outside of the mind of our dreamer. But ought the reality of a *rediviva* to be able to disturb a lizard?

Before the house of Meleager Gradiva disappears. We are not surprised that Norbert Hanold persists in his delusion that Pompeii has begun to live again about him in the noon hour of spirits, and that Gradiva has also returned to life and gone into the house where she lived before the fateful August day of the year 79. There dart through his mind keen conjectures about the personality of the owner, after whom the house may have been named, and about Gradiva's relation to the latter; these show that his science has now given itself over completely to the service of his imagination. After entering this house, he again suddenly discovers the apparition, sitting on low steps between two yellow pillars. "Spread out on her knees lay something white, which he was unable to distinguish clearly; it seemed to be a papyrus sheet" (G.). Taking for granted his most recent suppositions about her ancestry, he speaks to her in Greek, awaiting timorously the determination of whether the power of speech may, perhaps, be granted to her in her phantom existence. As she does not answer, he changes the greeting to Latin. Then, from smiling lips, come the words, "If you wish to speak with me, you must do so in German."

What embarrassment for us, the readers! Thus the author of *Gradiva* has made sport of us and decoyed us, as if by means of the refulgence of Pompeiian sunshine, into a little delusion so that we may be milder in our judgment of the poor man, whom the real noonday sun actually burns; but we know now, after recovering from brief confusion, that Gradiva is a living German girl, a fact which we wish to reject as utterly improbable. Reflecting calmly, we now await a discovery of what connection exists between the girl and the stone representation of her, and of how our young archæologist acquired the fancies which hint at her real personality.

Our hero is not freed so quickly as we from the delusion, for, "Even if the belief brought happiness," says our author, "it assumed everywhere, in

the bargain, a considerable amount of incomprehensibility." (G. .) Besides, this delusion probably has subjective roots of which we know nothing, which do not exist for us. He doubtless needs trenchant treatment to bring him back to reality. For the present he can do nothing but adapt the delusion to the wonderful discovery which he has just made. Gradiva, who had perished at the destruction of Pompeii, can be nothing but a ghost of the noon hour, who returns to life for the noon hour of spirits; but why, after the answer given in German, does the exclamation escape him: "I knew that your voice sounded like that"? Not only we, but the girl, too, must ask, and Hanold must admit that he has never heard her voice before, but expected to hear it in the dream, when he called to her, as she lay down to sleep on the steps of the temple. He begs her to repeat that action, but she then rises, directs a strange glance at him, and, after a few steps, disappears between the pillars of the court. A beautiful butterfly had, shortly before that, fluttered about her a few times; in his interpretation it had been a messenger from Hades, who was to admonish the departed one to return, as the noon hour of spirits had passed. The call, "Are you coming here again to-morrow in the noon hour?" Hanold can send after the disappearing girl. To us, however, who venture a more sober interpretation, it will seem that the young lady found something improper in the request which Hanold had made of her, and therefore, insulted, left him, as she could yet know nothing of his dream. May not her delicacy of feeling have realized the erotic nature of the request, which was prompted, for Hanold, only by the connection with his dream?

After the disappearance of Gradiva, our hero examines all the guests at the "Hotel Diomed" table and soon also those of "Hotel Suisse," and can then assure himself that in neither of the only two lodgings known to him in Pompeii is a person to be found who possesses the most remote resemblance to Gradiva. Of course he had rejected, as unreasonable, the supposition that he might really meet Gradiva in one of the two hostelries. The wine pressed on the hot soil of Vesuvius then helps to increase the day's dizziness.

The only certainty about the next day is that Norbert must again be in Meleager's house at noon; and, awaiting the hour, he enters Pompeii over the old city-wall, a way which is against the rules. An asphodel cluster of white bell-flowers seems, as flower of the lower world, significant enough for him to pluck and carry away. All his knowledge of antiquity appears to

him, however, while he is waiting, as the most purposeless and indifferent matter in the world, for another interest has acquired control of him, the problem, “what is the nature of the physical manifestation of a being like Gradiva, dead and alive at the same time, although the latter was true only in the noon hour of spirits?” (G. .) He is also worried lest to-day he may not meet the lady sought, because perhaps she may not be allowed to return for a long time, and when he again sees her between the pillars, he considers her appearance an illusion, which draws from him the grieved exclamation, “Oh, that you were still alive!” This time, however, he has evidently been too critical, for the apparition possesses a voice which asks him whether he wishes to bring her the white flower, and draws the man, who has again lost his composure, into a long conversation. Our author informs us, readers, to whom Gradiva has already become interesting as a living personality, that the ill-humoured and repellent glance of the day before has given way to an expression of searching inquisitiveness or curiosity. She really sounds him, demands, in explanation of his remark of the preceding day, when he had stood near her as she lay down to sleep, in this way learns of the dream in which she perished with her native city, then of the bas-relief, and of the position of the foot, which attracted the young archæologist. Now she shows herself ready to demonstrate her manner of walking, whereby the substitution of light, sand-coloured, fine leather shoes for the sandals, which she explains as adaptation to the present, is established as the only deviation from the original relief of Gradiva. Apparently she is entering into his delusion, whose whole range she elicits from him, without once opposing him. Only once she seems to have been wrested from her rôle by a peculiar feeling when, his mind on the bas-relief, he asserts that he has recognized her at first glance. As, at this stage of the conversation, she, as yet, knows nothing of the relief, she must be on the point of misunderstanding Hanold’s words, but she has immediately recovered herself again, and only to us will many of her speeches appear to have a double meaning, besides their significance in connection with the delusion, a real, present meaning, as, for example, when she regrets that he did not succeed in confirming the Gradiva-gait on the street. “What a shame; perhaps you would not have needed to take the long journey here.” (G. .) She learns also that he has named the bas-relief of her “Gradiva,” and tells him that her real name is Zoë!

“The name suits you beautifully, but it sounds to me like bitter mockery, for ‘Zoë’ means ‘life.’”

“One must adapt himself to the inevitable,” she responds. “And I have long accustomed myself to being dead.”

With the promise to be at the same place again on the morrow, she takes leave of him, after she has obtained the asphodel cluster. “To those who are more fortunate one gives roses in spring, but for me the flower of oblivion is the right one from your hand.” (G. .) Melancholy is suited to one so long dead, who has now returned to life for a few short hours.

We begin now to understand and to hope. If the young lady, in whose form Gradiva is again revived, accepts Hanold’s delusion so completely, she does it probably to free him from it. No other course is open; by opposition, one would destroy that possibility. Even the serious treatment of a real condition of this kind could proceed no differently than to place itself first on the ground story of the delusion-structure, and investigate it then as thoroughly as possible. If Zoë is the right person, we shall soon learn how one cures delusions like those of our hero. We should also like to know how such a delusion originates. It would be very striking, and yet not without example and parallel, if the treatment and investigation of the delusion should coincide and, while it is being analysed, result in the explanation of its origin. We have a suspicion, of course, that our case might then turn out to be an “ordinary” love story, but one may not scorn love as a healing power for delusions; and was not our hero’s captivation by the Gradiva-relief also a complete infatuation, directed, to be sure, at the past and lifeless?

After Gradiva’s disappearance, there is heard once more a distant sound like the merry note of a bird flying over the city of ruins. The man who has remained behind picks up something white, which Gradiva has left, not a papyrus leaf, but a sketch-book with pencil drawings of Pompeii. We should say that the fact that she has forgotten the little book, in this place, is a pledge of her return, for we assert that one forgets nothing without a secret reason or a hidden motive.

The remainder of the day brings to our hero all sorts of remarkable discoveries and facts, which he neglects to fit together. In the wall of the portico where Gradiva disappeared, he notices to-day a narrow cleft, which is, however, wide enough to afford passage to an unusually slender figure. He recognizes the fact that Zoë-Gradiva does not need to sink into the

ground here, an idea which is so senseless that he is now ashamed of the discarded belief, but that she uses this route to go back to her tomb. A faint shadow seems to him to dissolve at the end of the Street of Tombs, before the so-called Villa of Diomede. Dizzy, as on the previous day, and occupied with the same problem, he wanders now about Pompeii, wondering of what physical nature Zoë-Gradiva may be and whether one might feel anything if one touched her hand. A peculiar impulse urges him to undertake this experiment, and yet an equally great timidity in connection with the idea restrains him. On a hot, sunny slope he meets an older man who, from his equipment, must be a zoologist or a botanist, and seems to be busy catching things. The latter turns to him and says: "Are you interested in *Faraglionensis*? I should hardly have supposed it, but it seems thoroughly probable that they are found, not only in the *Faraglioni* of Capri, but also dwell permanently on the mainland. The method suggested by my colleague, Eimer, is really good; I have already used it often with the best of success. Please remain quite still." (G. .) The speaker stops talking then, and holds a little snare, made of a long grass-blade, before a narrow crevice, from which the blue, chatoyant, little head of a lizard peeps. Hanold leaves the lizard-hunter with the critical thought that it is hardly credible what foolishly remarkable purposes can cause people to make the long trip to Pompeii, in which criticism he does not, of course, include himself and his intention of seeking foot-prints of Gradiva in the ashes of Pompeii. The gentleman's face, moreover, seems familiar to him, as if he has noticed it casually in one of the two hotels; the man's manner of addressing him has also sounded as if directed at an acquaintance. As he continues his wandering, a side street leads him to a house not previously discovered by him; this proves to be the "Albergo del Sole." The hotel-keeper, who is not busy, avails himself of the opportunity to recommend highly his house and the excavated treasures in it. He asserts that he was present when there were found near the Forum the young lovers who, on realizing their inevitable destruction, had clasped each other in firm embrace and thus awaited death. Hanold has already heard of that before, and shrugged his shoulders over it, as a fabulous invention of some especially imaginative narrator, but to-day the words of the hotel-keeper awaken in him credulity, which soon stretches itself more when the former brings forth a metal brooch encrusted with green patina, which, in his presence, was gathered, with the remains of the girl, from the

ashes. He secures this brooch without further critical consideration, and when, as he is leaving the hotel, he sees in an open window, nodding down, a cluster of white asphodel blossoms, the sight of the grave-flower thrills him as an attestation of the genuineness of his new possession.

With this brooch, however, a new delusion takes possession of him or, rather, the old one continues for a while, apparently not a good omen for the treatment which has been started. Not far from the Forum a couple of young lovers were excavated in an embrace, and in the dream he saw Gradiva lie down to sleep in that very neighbourhood, at the Apollo temple. Was it not possible that in reality she went still farther from the Forum to meet there some one with whom she then died?

A tormenting feeling, which we can perhaps compare to jealousy, originates from this supposition. He appeases it by referring to the uncertainty of the combination, and so far regains his senses as to be able to have his evening meal in “Hotel Diomed.” His attention is attracted by two newly arrived guests, a man and a woman, whom, because of a certain resemblance, he considers brother and sister — in spite of the difference in the colour of their hair. They are the first people whom he has encountered on this trip who seem possibly congenial. A red Sorrento rose, which the young girl wears, awakes in him some memory — he cannot recall what. Finally he goes to bed and dreams; it is remarkable nonsense, but apparently concocted of the day’s experiences. “Somewhere in the sun Gradiva sat making a trap out of a blade of grass, in order to catch a lizard, and she said, ‘Please stay quite still — my colleague is right; the method is really good, and she has used it with greatest success!’” He resists the dream, even in his sleep, with the criticism that it is, of course, utter madness, and he succeeds in getting rid of it with the aid of an invisible bird, who utters a short, merry call and carries the lizard away in his beak.

In spite of all this ghostly visitation, he awakes rather cleared and settled mentally. A rose-bush, which bears flowers of the kind that he noticed yesterday on the young lady, recalls to him that in the night some one said that in the spring one gave roses. He plucks some of the roses involuntarily, and there must be some association with these which has a liberating effect upon his mind. Rid of his aversion to human beings, he takes the customary road to Pompeii, laden with the roses, the brooch and the sketch-book, and occupied by the different problems relating to Gradiva. The old delusion has become full of flaws; he already doubts if

she is permitted to stay in Pompeii in the noon hour only, and not at other times. Emphasis, on that account, is transferred to the object recently acquired, and the jealousy connected with it torments him in all sorts of disguises. He might almost wish that the apparition should remain visible to only his eyes and escape the notice of others; in that way, he might consider her his exclusive property. During his ramble awaiting the noon hour he has a surprising encounter. In the Casa del Fauno he happens upon two people who doubtless believe themselves undiscoverable in a nook, for they are embracing each other and their lips meet. With amazement he recognizes in them the congenial couple of yesterday evening; but for brother and sister their present position, the embrace and the kiss are of too long duration. So it is a couple of lovers, probably a young bridal couple, another Augustus and Gretchen. Strange to relate, the sight of this now arouses in him nothing but pleasure, and fearful, as if he had disturbed a secret act of devotion, he withdraws unobserved. A deference which has long been lacking in him has been restored.

Arriving at Meleager's house, he is afraid that he may find Gradiva in the company of another man, and becomes so excited about it that he can find no other greeting for her than the question: "Are you alone?" With difficulty she makes him realize that he has picked the roses for her; he confesses to her the latest delusion, that she is the girl who was found in the Forum in her lover's embrace and to whom the green brooch had belonged. Not without mockery, she inquires if he found the piece in the sun. The latter — here called "Sole" — brings to light many things of that sort. As cure for the dizziness which he admits, she proposes to him to share a lunch with her and offers him half of a piece of white bread wrapped in tissue paper; the other half of this she consumes with apparent appetite. Thereat her faultless teeth gleam between her lips and, in biting the crust, cause a slight crunching sound. To her remark, "It seems to me as if we had already eaten our bread thus together once two thousand years ago. Can't you remember it?" (G. .) he cannot answer, but the strengthening of his mind by the nourishment, and all the evidences of present time in her do not fail to have effect on him. Reason stirs in him and makes him doubt the whole delusion that Gradiva is only a noonday ghost; on the other hand, there is the objection that she, herself, has just said that she had already shared her repast with him two thousand years ago. As a means of settling this conflict there occurs to him an experiment

which he executes with slyness and restored courage. Her left hand, with its slender fingers, is resting on her knees, and one of the house-flies, about whose boldness and worthlessness he formerly became so indignant, alights on this hand. Suddenly Hanold's hand rises and claps, with no gentle stroke, on the fly and on Gradiva's hand. This bold experiment affords him twofold success: first the joyous conviction that he actually touched a really living, warm hand, then, however, a reprimand, before which he starts up in terror from his seat on the step. For from Gradiva's lips come the words, after she has recovered from her amazement, "You are surely apparently crazy, Norbert Hanold."

Calling a person by name is recognized as the best method of awakening him, when he is sleeping, or of awakening a somnambulist. Unfortunately we are not permitted to observe the results, for Norbert Hanold, of Gradiva's calling his name, which he had told to no one in Pompeii. For at this critical moment, the congenial lovers appear from the Casa del Fauno and the young lady calls, in a tone of pleasant surprise, "Zoë! You here, too? and also on your honeymoon? You have not written me a word about it, you know." Before this new proof of the living reality of Gradiva, Hanold flees.

Zoë-Gradiva, too, is not most pleasantly surprised by the unexpected visit which disturbs her, it seems, in an important piece of work. Soon composed, she answers the question with a glib speech, in which she informs her friend, and especially us, about the situation; and thereby she knows how to get rid of the young couple. She extends her compliments, but she is not on her wedding-trip. "The young man who just went out is labouring also under a remarkable delusion; it seems to me that he believes a fly is buzzing in his head; well, every one has, of course, some kind of bee in his bonnet. As is my duty, I have some knowledge of entomology and can, therefore, be of a little service in such cases. My father and I live in the 'Sole'; he, too, had a sudden and pleasing idea of bringing me here with him if I would be responsible for my own entertainment and make no demands upon him. I said to myself that I should certainly dig up something interesting alone here. Of course I had not reckoned at all on the find which I made — I mean the good fortune of meeting you, Gisa." (G. .) Zoë now feels obliged to leave at once, to be company for her father at the "Sole." So she goes, after she has introduced herself to us as the daughter of the zoologist and lizard-catcher, and has

admitted in ambiguous words her therapeutic intentions and other secret ones. The direction which she takes is not that of the “Sun Hotel,” in which her father is awaiting her, but it seems to her, too, that in the region of the Villa of Diomede a shadowy form is seeking its burial-place and disappears under one of the monuments; therefore, with foot poised each time almost perpendicularly, she directs her steps to the Street of Tombs. Thither, in shame and confusion, Hanold has fled, and is wandering up and down in the portico of the court without stopping, occupied with settling the rest of his problem by mental efforts. One thing has become unimpeachably clear to him; that he was utterly foolish and irrational to believe that he communed with a young Pompeiian girl who had become more or less physically alive again; and this clear insight into his madness forms incontestably an essential bit of progress in the return to sound reason. On the other hand, however, this living girl, with whom other people also communicate, as with one of a corporeal reality like theirs, is Gradiva, and she knows his name; for the solution of this riddle his scarcely awakened reason is not strong enough. Emotionally, also, he is not calm enough to be equal to so difficult a task, for he would most gladly have been buried two thousand years ago in the Villa of Diomede, only to be sure of never meeting Zoë-Gradiva again. A violent longing to see her struggles meanwhile with the remnants of the inclination to flee, which has persisted in him.

Turning at one of the four corners of the colonnade, he suddenly recoils. On a fragmentary wall-ruin there sits one of the girls who met death here in the Villa of Diomede; but that attempt to take refuge again in the realm of madness is soon put aside; no, it is Gradiva, who has apparently come to give him the last bit of her treatment. She interprets rightly his first instinctive movement to flee, as an attempt to leave the place, and points out to him that he cannot escape, for outside a frightful cloudburst is in progress. The merciless girl begins the examination with the question as to what he intended in connection with the fly on her hand. He does not find courage to make use of a definite pronoun, but acquires the more valuable kind needed to put the deciding question.

“I was — as they say — somewhat confused mentally and ask pardon that I — the hand — in that way — how I could be so stupid, I can’t understand — but I can’t understand either how its owner could use my name in upbraiding me for my — my madness.” (G. .)

“Your power of understanding has not yet progressed that far, Norbert Hanold. Of course, I cannot be surprised, for you have long ago accustomed me to it. To make that discovery again, I should not have needed to come to Pompeii, and you could have confirmed it for me a good hundred miles nearer.”

“A good hundred miles nearer; diagonally across from your house, in the corner house; in my window, in a cage, is a canary,” she discloses to the still bewildered man.

This last word touches the hero like a memory from afar. That is surely the same bird whose song has suggested to him the trip to Italy.

“In that house lives my father, Richard Bertgang, professor of zoology.”

As his neighbour, therefore, she is acquainted with him and his name. It seems as if the disappointment of a superficial solution is threatening us — a solution unworthy of our expectations.

As yet Norbert Hanold shows no regained independence of thought, when he repeats, “Then are you — are you Miss Zoë Bertgang? But she looked quite different — —”

Miss Bertgang’s answer shows then that other relations besides those of neighbourliness have existed between them. She knows how to intercede for the familiar manner of address, which he has, of course, used to the noonday spirit, but withdrawn again from the living girl; she makes former privileges of use to her here. “If you find that form of address more suitable between us, I can use it too, you know, but the other came to me more naturally. I don’t know whether I looked different when we used to run about before with each other as friends, every day, and occasionally beat and cuffed each other for a change, but if, in recent years, you had favoured me with even one glance you might perhaps have seen that I have looked like this for a long time.”

A childhood friendship had therefore existed between the two, perhaps a childhood love, from which the familiar form of address derived its justification. Isn’t this solution perhaps as superficial as the one first supposed? The fact that it occurs to us that this childhood relation explains in an unexpected way so many details of what has occurred in the present intercourse between them makes the matter essentially deeper. Does it not seem that the blow on Zoë-Gradiva’s hand which Norbert Hanold has so splendidly motivated by the necessity of solving, experimentally, the question of the physical existence of the apparition, is, from another

standpoint, remarkably similar to a revival of the impulse for “beating and cuffing,” whose sway in childhood Zoë’s words have testified to? And when Gradiva puts to the archæologist the question whether it does not seem to him that they have once already, two thousand years ago, shared their luncheon, does not the incomprehensible question become suddenly senseful, when we substitute for the historical past the personal childhood, whose memories persist vividly for the girl, but seem to be forgotten by the young man? Does not the idea suddenly dawn upon us that the fancies of the young man about his Gradiva may be an echo of his childhood memories? Then they would, therefore, be no arbitrary products of his imagination, but determined, without his knowing it, by the existing material of childhood impressions already forgotten, but still active in him. We must be able to point out in detail the origin of these fancies, even if only by conjecture. If, for instance, Gradiva must be of pure Greek ancestry, the daughter of a respected man, perhaps of a priest of Ceres, that predisposes us fairly well for an after-effect of the knowledge of her Greek name — Zoë, and of her membership in the family of a professor of zoology. If, however, these fancies of Hanold’s are transformed memories, we may expect to find in the disclosures of Zoë Bertgang, the suggestion of the sources of these fancies. Let us listen; she tells us of an intimate friendship of childhood; we shall soon learn what further development this childhood relation had in both.

“Then up to the time when people call us ‘Backfisch,’ for some unknown reason, I had really acquired a remarkable attachment for you, and thought that I could never find a more pleasing friend in the world. Mother, sister, or brother I had not, you know; to my father a slow-worm in alcohol was far more interesting than I, and people (I count girls such) must surely have something with which they can occupy their thoughts and the like. Then you were that something, but when archæology overcame you, I made the discovery that you — excuse the familiarity, but your new formality sounds absurd to me — I was saying that I imagined that you had become an intolerable person, who had no longer, at least for me, an eye in his head, a tongue in his mouth, nor any of the memories that I retained of our childhood friendship. So I probably looked different from what I did formerly, for when, occasionally, I met you at a party, even last winter, you did not look at me and I did not hear your voice; in this, of course, there was nothing that marked me out especially, for you

treated all the others in the same way. To you I was but air, and you, with your shock of light hair, which I had formerly pulled so often, were as boresome, dry and tongue-tied as a stuffed cockatoo and at the same time as grandiose as an — archæopteryx; I believe the excavated antediluvian bird-monster is so called; but that your head harboured an imagination so magnificent as here in Pompeii to consider me as something excavated and restored to life — I had not surmised that of you, and when you suddenly stood before me unexpectedly, it cost me some effort at first to understand what kind of incredible fancy your imagination had invented. Then I was amused and, in spite of its madness, it was not entirely displeasing to me. For, as I said, I had not expected it of you." (G. .)

So she thus tells us clearly enough what, with the years, has become of the childhood friendship for both of them. With her it expanded into an intense love affair, for one must have something, you know, to which one, that is, a girl, pins her affections. Miss Zoë, the incarnation of cleverness and clarity, makes her psychic life, too, quite transparent for us. If it is already the general rule for a normal girl that she first turns her affection to her father, she is especially ready to do it, she who has no one but her father in her family; but this father has nothing left for her; the objects of science have captured all his interest. So she has to look around for another person, and clings with especial fervour to the playmate of her youth. When he, too, no longer has any eyes for her, it does not destroy her love, rather augments it, for he has become like her father, like him absorbed by science and, by it, isolated from life and from Zoë. So it is granted to her to be faithful in unfaithfulness, to find her father again in her beloved, to embrace both with the same feeling as we may say, to make them both identical in her emotions. Where do we get justification for this little psychological analysis, which may easily seem autocratic? In a single, but intensely characteristic detail the author of the romance gives it to us. When Zoë pictures for us the transformation of the playmate of her youth, which seems so sad for her, she insults him by a comparison with the archæopteryx, that bird-monster which belongs to the archæology of zoology. So she has found a single concrete expression for identifying the two people; her resentment strikes the beloved as well as the father with the same word. The archæopteryx is, so to speak, the compromise, or intermediary representation in which the folly of her beloved coincides with her thought of an analogous folly of her father.

With the young man, things have taken a different turn. The science of antiquity overcame him and left to him interest only in the women of bronze and stone. The childhood friendship died, instead of developing into a passion, and the memories of it passed into such absolute forgetfulness that he does not recognize nor pay any attention to the friend of his youth, when he meets her in society. Of course, when we continue our observations, we may doubt if “forgetfulness” is the right psychological term for the fate of these memories of our archæologist. There is a kind of forgetting which distinguishes itself by the difficulty with which the memory is awakened, even by strong objective appeals, as if a subjective resistance struggled against the revival. Such forgetting has received the name “repression” in psychopathology; the case which Jensen has presented to us seems to be an example of repression. Now we do not know, in general, whether, in psychic life, forgetting an impression is connected with the destruction of its memory-trace; about repression we can assert with certainty that it does not coincide with the destruction, the obliteration, of the memory. The repressed material cannot, as a rule, break through, of itself, as a memory, but remains potent and effective. Some day, under external influence, it causes psychic results which one may accept as products of transformation or as remnants of forgotten memories; and if one does not view them as such, they remain incomprehensible. In the fancies of Norbert Hanold about Gradiva, we thought we recognized already the remnants of the repressed memories of his childhood friendship with Zoë Bertgang. Quite legitimately one may expect such a recurrence of the repressed material, if the man’s erotic feelings cling to the repressed ideas, if his erotic life has been involved in the repression. Then there is truth in the old Latin proverb which was perhaps originally aimed at expulsion through external influences, not at inner conflict: “You may drive out natural disposition with a two-pronged fork, but it will always return,” but it does not tell all, announces only the fact of the recurrence of repressed material, and does not describe at all the most remarkable manner of this recurrence, which is accomplished as if by malicious treason; the very thing which has been chosen as a means of repression — like the “two-pronged fork” of the proverb — becomes the carrier of the thing recurring; in and behind the agencies of repression the material repressed finally asserts itself victoriously. A well-known etching by Félicien Rops illustrates this fact, which is generally

overlooked and lacks acceptance, more impressively than many explanations could; and he does it in the typical case of the repression in the lives of saints and penitents. From the temptations of the world, an ascetic monk has sought refuge in the image of the crucified Saviour. Then, phantom-like, this cross sinks and, in its stead, there rises shining, the image of a voluptuous, unclad woman, in the same position of the crucifixion. Other painters of less psychological insight have, in such representations of temptation, depicted sin as bold and triumphant, near the Saviour on the cross. Rops, alone, has allowed it to take the place of the Saviour on the cross; he seems to have known that the thing repressed proceeds, at its recurrence, from the agency of repression itself.

If Norbert Hanold were a living person, who had, by means of archæology, driven love and the memory of his childhood friendship out of his life, it would now be legitimate and correct that an antique relief should awaken in him the forgotten memory of the girl beloved in his childhood; it would be his well-deserved fate to have fallen in love with the stone representation of Gradiva, behind which, by virtue of an unexplained resemblance, the living and neglected Zoë becomes effective.

Miss Zoë, herself, seems to share our conception of the delusion of the young archæologist, for the pleasure which she expresses at the end of her "unreserved, detailed and instructive lecture" is hardly based on anything other than her readiness to refer his entire interest in Gradiva to her person. This is exactly what she does not believe him capable of, and what, in spite of all the disguises of the delusion, she recognizes as such. Her psychic treatment of him has a beneficent effect; he feels himself free, as the delusion is now replaced by that of which it can be only a distorted and unsatisfactory copy. He immediately remembers and recognizes her as his good, cheerful, clever comrade who has not changed essentially; but he finds something else most strange —

"That a person must die to become alive again," says the girl, "but for archæologists that is of course necessary." (G. .) She has apparently not yet pardoned him for the détour which he made from the childhood friendship through the science of antiquity to this relation which has recently been established.

"No, I mean your name — Because Bertgang has the same meaning as Gradiva and signifies 'the one splendid in walking.'" (G. .)

Even we are not prepared for that. Our hero begins to rise from his humility and to play an active rôle. He is, apparently, entirely cured of his delusion, lifted far above it, and proves this by tearing asunder the last threads of the web of delusion. Patients, also, who have been freed from the compulsion of their delusion, by the disclosure of the repression behind it, always act in just that way. When they have once understood, they themselves offer the solutions for the last and most significant riddles of their strange condition in suddenly emerging ideas. We had already believed, of course, that the Greek ancestry of the mythical Gradiva was an after-effect of the Greek name, Zoë, but with the name, Gradiva, we had ventured nothing; we had supposed it the free creation of Norbert Hanold's imagination, and behold! this very name now shows itself to be a remnant, really a translation of the repressed family-name of the supposedly forgotten beloved of his youth.

The derivation and solution of the delusion are now completed. What follows may well serve as a harmonious conclusion of the tale. In regard to the future, it can have only a pleasant effect on us, if the rehabilitation of the man, who formerly had to play the lamentable rôle of one needing to be cured, progresses, and he succeeds in awakening in the girl some of the emotions which he formerly experienced. Thus it happens that he makes her jealous by mentioning the congenial young lady, who disturbed them in Meleager's house, and by the acknowledgment that the latter was the first girl who had impressed him much. When Zoë is then about to take a cool departure, with the remark that now everything is reasonable again, she herself not least of all, that he might look up Gisa Hartleben, or whatever her name might now be, and be of scientific assistance to her about the purpose of her stay in Pompeii, but she has to go now to the "Albergo del Sole" where her father is already waiting for her at lunch, perhaps they may see each other again some time at a party in Germany or on the moon, he seizes upon the troublesome fly as a means of taking possession of her cheek, first, and then of her lips, and assumes the aggressive, which is the duty of a man in the game of love. Only once more does a shadow seem to fall on their happiness, when Zoë reminds him that now she must really go to her father, who will otherwise starve in the "Sole." "Your father — what will he —— ?" (G. .)

But the clever girl knows how to silence the apprehension quickly. "Probably he will do nothing; I am not an indispensable piece in his

zoological collection; if I were, my heart would probably not have clung to you so unwisely." Should the father, however, by way of exception, in this case, have an opinion different from hers, there is a sure method. Hanold needs only to go over to Capri, there catch a *lacerta faraglionensis*, for which purpose he may practise the technique on her little finger, then set the animal free again here, catch it before the eyes of the zoologist and give him the choice of the *faraglionensis* on the mainland or his daughter, a proposal in which mockery, as one may easily note, is combined with bitterness, an admonition to the betrothed, also, not to follow too closely the model after which his beloved has chosen him. Norbert Hanold sets us at rest on this matter, as he expresses, by all sorts of apparently trivial symptoms, the great transformation which has come over him. He voices the intention of taking a wedding trip with his Zoë to Italy and Pompeii, as if he had never been indignant at the newly married travellers, Augustus and Gretchen. His feelings towards this happy couple, who so unnecessarily travelled more than one hundred miles from their German home, have entirely disappeared from his memory. Certainly the author is right when he cites such weakening of memory as the most valuable mark of a mental change. Zoë replies to the announced desire about the destination of their journey, "*by her childhood friend who had, in a way, also been excavated from the ashes*," (G.), that she does not yet feel quite alive enough for such geographical decision.

Beautiful reality has now triumphed over the delusion. Yet an honour still awaits the latter before the two leave Pompeii. When they have arrived at the Hercules Gate, where, at the beginning of the Strada Consolare, old stepping-stones cross the street, Norbert Hanold stops and asks the girl to go ahead. She understands him and, "raising her dress slightly with her left hand, Gradiva *rediviva* Zoë Bertgang, viewed by him with dreamily observing eyes, crossed with her calmly buoyant walk, through the sunlight, over the stepping-stones." With the triumph of eroticism, what was beautiful and valuable in the delusion is now acknowledged.

With the last comparison of "the childhood friend excavated from the ashes," the author of the story has, however, put into our hand the key of the symbolism which the delusion of the hero made use of in the disguise of the repressed memory. There is no better analogy for repression, which at the same time makes inaccessible and conserves something psychic,

than the burial which was the fate of Pompeii, and from which the city was able to arise again through work with the spade. Therefore in his imagination the young archæologist had to transport to Pompeii the original figure of the relief which reminded him of the forgotten beloved of his youth. Jensen, however, had a good right to linger over the significant resemblance which his fine sense traced out between a bit of psychic occurrence in the individual and a single historical event in the history of man.

II

It was really our intention to investigate with the aid of definite analytic method only the two or three dreams which are found in the tale *Gradiva*; how did it happen then that we allowed ourselves to be carried away with the analysis of the whole story and the examination of the psychic processes of the two chief characters? Well, that was no superfluous work, but a necessary preparation. Even when we wish to understand the real dreams of an actual person, we must concern ourselves intensively with the character and the fortunes of this person, not only the experiences shortly before the dream, but also those of the remote past. I think, however, that we are not yet free to turn to our real task, but must still linger over the piece of fiction itself, and perform more preparatory work.

Our readers will, of course, have noticed with surprise that till now we have considered Norbert Hanold and Zoë Bertgang in all their psychic expressions and activities, as if they were real individuals and not creatures of an author, as if the mind of their creator were absolutely transparent, not a refractory and cloudy medium; and our procedure must seem all the more surprising when the author of *Gradiva* expressly disavows the portrayal of reality by calling his tale a “Fancy.” We find, however, that all his pictures copy reality so faithfully that we should not contradict if *Gradiva* were called not a “Fancy,” but a study in psychiatry. Only in two points has Wilhelm Jensen made use of his license, to create suppositions which do not seem to have roots in the earth of actual law: first, when he has the young archæologist find a genuinely antique bas-relief which, not only in the detail of the position of the foot in walking, but in all details, the shape of the face, and the bearing, copies a person living much later, so that he can consider the physical manifestation of

this person to be the cast endowed with life; second, when the hero is caused to meet the living girl in Pompeii, whither his fancy has transported the dead girl, while he separates himself, by the journey to Pompeii, from the living girl, whom he has noticed on the street of his home city; this second instance is no tremendous deviation from the possibilities of life; it asks aid only of chance, which undeniably plays a part in so many human fates, and, moreover, makes it reasonable, for this chance reflects again the destiny which has decreed that through flight one is delivered over to the very thing that one is fleeing from. More fantastic, and originating solely in the author's arbitrariness, seems the first supposition which brings in its train the detailed resemblance of the cast to the living girl, where moderation might have limited the conformity to the one trait of the position of the foot in walking. One might then have tried to let one's own imagination play in order to establish connection with reality. The name Bertgang might point to the fact that the women of that family had been distinguished, even in ancient times, by the characteristic of a beautiful gait, and by heredity the German Bertgang was connected with those Romans, a woman of whose family had caused the ancient artist to fix in a bas-relief the peculiarity of her walk. As the individual variations of human structure are, however, not independent of one another, and as the ancient types, which we come upon in the collections, are actually always emerging again in our midst, it would not be entirely impossible that a modern Bertgang should repeat again the form of her ancient forbear, even in all the other traits of her physique. Inquiry of the author of the story for the sources of this creation might well be wiser than such speculation; a good prospect of solving again a bit of supposed arbitrariness would probably then appear. As, however, we have not access to the psychic life of the author, we leave to him the undiminished right of building up a thoroughly valid development on an improbable supposition, a right which Shakespeare, for example, has asserted in *King Lear*.

Otherwise, we wish to repeat, Wilhelm Jensen has given us an absolutely correct study in psychiatry, in which we may measure our understanding of psychic life, a story of illness and cure adapted to the inculcation of certain fundamental teachings of medical psychology. Strange enough that he should have done this! What if, in reply to questioning, he should deny this intention? It is so easy to draw comparisons and to put constructions on things. Are we not rather the ones

who have woven secret meanings, which were foreign to him, into the beautiful poetic tale? Possibly; we shall come back to that later. As a preliminary, however, we have tried to refrain from interpretations with that tendency, by reproducing the story, in almost every case, from the very words of the writer; and we have had him furnish text as well as commentary, himself. Any one who will compare our text with that of *Gradiva* will have to grant this.

Perhaps in the judgment of the majority we are doing a poor service for him when we declare his work a study in psychiatry. An author is to avoid all contact with psychiatry, we are told, and leave to physicians the portrayal of morbid psychic conditions. In reality no true author has ever heeded this commandment. The portrayal of the psychic life of human beings is, of course, his most especial domain; he was always the precursor of science and of scientific psychology. The borderline between normal and morbid psychic conditions is, in a way, a conventional one, and, in another way, in such a state of flux that probably every one of us oversteps it many times in the course of a day. On the other hand, psychiatry would do wrong to wish to limit itself continually to the study of those serious and cloudy illnesses which arise from rude disturbances of the delicate psychic apparatus. It has no less interest in the lesser and adjustable deviations from the normal which we cannot yet trace back farther than disturbances in the play of psychic forces; indeed, it is by means of these that it can understand normal conditions, as well as the manifestations of serious illness. Thus the author cannot yield to the psychiatrist nor the psychiatrist to the author, and the poetic treatment of a theme from psychiatry may result correctly without damage to beauty.

The imaginative representation of the story of illness and its treatment, which we can survey better after finishing the story and relieving our own suspense, is really correct. Now we wish to reproduce it with the technical expressions of our science, in doing which it will not be necessary to repeat what has already been related.

Norbert Hanold’s condition is called a “delusion” often enough by the author of the story, and we also have no reason to reject this designation. We can mention two chief characteristics of “delusion,” by which it is not, of course, exhaustively described, but is admittedly differentiated from other disturbances. It belongs first to that group of illnesses which do not directly affect the physical, but express themselves only by psychic signs,

and it is distinguished secondly by the fact that “fancies” have assumed control, that is, are believed and have acquired influence on actions. If we recall the journey to Pompeii to seek in the ashes the peculiarly-formed foot-prints of Gradiva, we have in it a splendid example of an act under the sway of the delusion. The psychiatrist would perhaps assign Norbert Hanold’s delusion to the great group of paranoia and designate it as a “fetichistic erotomania,” because falling in love with the bas-relief would be the most striking thing to him and because, to his conception, which coarsens everything, the interest of the young archæologist in the feet and foot-position of women must seem suspiciously like fetichism. All such names and divisions of the different kinds of delusion are, however, substantially useless and awkward.

The old-school psychiatrist would, moreover, stamp our hero as a dégénéré, because he is a person capable, on account of such strange predilections, of developing a delusion, and would investigate the heredity which has unrelentingly driven him to such a fate. In this, however, Jensen does not follow him; with good reason, he brings us nearer to the hero to facilitate for us æsthetic sympathy with him; with the diagnosis “dégénéré,” whether or not it may be justifiable to us scientifically, the young archæologist is at once moved farther from us, for we, readers, are, of course, normal people and the measure of humanity. The essential facts of heredity and constitution in connection with this condition also concern the author of *Gradiva* little; instead, he is engrossed in the personal, psychic state which can give rise to such a delusion.

In an important point, Norbert Hanold acts quite differently from ordinary people. He has no interest in the living woman; science, which he serves, has taken this interest from him and transferred it to women of stone or bronze. Let us not consider this an unimportant peculiarity; it is really the basis of the story, for one day it happens that a single such bas-relief claims for itself all the interest which would otherwise belong only to the living woman, and thereby originates the delusion. Before our eyes there is then unfolded the story of how this delusion is cured by a fortunate set of circumstances, the interest transferred back again from the cast to the living girl. The author of the story does not allow us to trace the influences because of which our hero begins to avoid women; he only suggests to us that such conduct is not explained by his predisposition which is invested with a rather fanciful — we might add, erotic — need.

We learn later also that in his childhood he did not avoid other children; he was then friendly with the little girl, was inseparable from her, shared with her his lunches, cuffed her, and was pulled around by her. In such attachment, such a combination of tenderness and aggression, is expressed the incomplete eroticism of child life, which expresses its activities first spitefully and then irresistibly and which, during childhood, only physicians and writers usually recognize as eroticism. Our author gives us to understand clearly that he has those intentions, for he suddenly causes to awaken in his hero, with suitable motive, a lively interest in the gait and foot-position of women, an interest which, in science, as well as among the ladies of his home-city, must bring him into disrepute as a foot-fetichist, and is to us, however, necessarily derived from the memory of his childhood playmate. The girl, to be sure, was characterized, as a child, by the beautiful walk with her foot almost perpendicular as she stepped out, and through the portrayal of this very gait an antique bas-relief later acquired for Norbert Hanold great significance. Let us add, moreover, immediately, that the author of *Gradiva* stands in complete agreement with science in regard to the derivation of the remarkable manifestation of fetichism. Since the investigations by Binet we really try to trace fetichism back to erotic impressions of childhood.

The condition of continued avoidance of women gives the personal qualification, as we say, the disposition for the formation of a delusion; the development of psychic disturbance begins at the moment when a chance impression awakens the forgotten childhood experiences which are emphasized in an erotic way that is at least traceable. Awakened is really not the right term, however, when we consider the further results. We must reproduce our author’s correct representation in a mode of expression artistically correct, and psychological. On seeing the relief Norbert Hanold does not remember that he has seen such a foot-position in the friend of his youth; he certainly does not remember and yet every effect of the relief proceeds from such connection with the impression of his childhood. The childhood-impression, stirred, becomes active, so that it begins to show activity, though it does not appear in consciousness, but remains “unconscious,” a term which we now use unavoidably in psychopathology. This term “unconscious” we should now like to see withdrawn from all the conflicts of philosophers and natural philosophers, which have only etymological significance. For psychic processes which are active and yet

at the same time do not come through into the consciousness of the person referred to, we have at present no better name and we mean nothing else by “unconsciousness.” If many thinkers wish to dispute as unreasonable the existence of such an unconscious, we think they have never busied themselves with analogous psychic phenomena, and are under the spell of the common idea that everything psychic which is active and intensive becomes, thereby, at the same time, conscious, and they have still to learn what our author knows very well, that there are, of course, psychic processes, which, in spite of the fact that they are intensive and show energetic activities, remain far removed from consciousness.

We said once that the memories of the childhood relations with Zoë are in a state of “repression” with Norbert Hanold; and we have called them “unconscious memories.” Here we must, of course, turn our attention to the relation between the two technical terms which seem to coincide in meaning. It is not hard to clear this up. “Unconscious” is the broader term, “repressed” the narrower. Everything that is repressed is unconscious; but we cannot assert that everything unconscious is repressed. If Hanold, at the sight of the relief, had remembered his Zoë’s manner of walking, then a formerly unconscious memory would have become immediately active and conscious, and thus would have shown that it was not formerly repressed. “Unconscious” is a purely descriptive term, in many respects indefinite and, so to speak, static; “repressed” is a dynamic expression which takes into consideration the play of psychic forces and the fact that there is present an effort to express all psychic activities, among them that of becoming conscious again, but also a counterforce, a resistance, which might hinder a part of these psychic activities, among these, also, getting into consciousness. The mark of the repressed material is that, in spite of its intensity, it cannot break through into consciousness. In Hanold’s case, therefore, it was a matter, at the appearance of the bas-relief on his horizon, of a repressed unconscious, in short of a repression.

The memories of his childhood association with the girl who walks beautifully are repressed in Norbert Hanold, but this is not yet the correct view of the psychological situation. We remain on the surface so long as we treat only of memories and ideas. The only valuable things in psychic life are, rather, the emotions. All psychic powers are significant only through their fitness to awaken emotions. Ideas are repressed only because they are connected with liberations of emotions, which are not to come to

light; it would be more correct to say that repression deals with the emotions, but these are comprehensible to us only in connection with ideas. Thus, in Norbert Hanold, the erotic feelings are repressed, and, as his eroticism neither knows nor has known another object than Zoë Bertgang of his youth, the memories of her are forgotten. The antique bas-relief awakens the slumbering eroticism in him and makes the childhood memories active. On account of a resistance in him to the eroticism, these memories can become active only as unconscious. What now happens in him is a struggle between the power of eroticism and the forces that are repressing it; the result of this struggle is a delusion.

Our author has omitted to give the motive whence originates the repression of the erotic life in his hero; the latter's interest in science is, of course, only the means of which the repression makes use; the physician would have to probe deeper here, perhaps in this case without finding the foundation. Probably, however, the author of *Gradiva*, as we have admiringly emphasized, has not hesitated to represent to us how the awakening of the repressed eroticism results from the very sphere of the means which are serving the repression. It is rightly an antique, the bas-relief of a woman, through which our archæologist is snatched and admonished out of his alienation from love to pay the debt with which we are charged by our birth.

The first manifestations of the process now stimulated by the bas-relief are fancies which play with the person represented by it. The model appears to him to be something "of the present," in the best sense, as if the artist had fixed the girl walking on the street from life. The name, Gradiva, which he forms from the epithet of the war-god advancing to battle, Mars Gradivus, he lends to the ancient girl; with more and more definitions he endows her with a personality. She may be the daughter of an esteemed man, perhaps of a patrician, who is associated with the temple service of a divinity; he believes that he reads Greek ancestry in her features, and finally this forces him to transport her far from the confusion of a metropolis to more peaceful Pompeii, where he has her walking over the lava stepping-stones which make possible the crossing of the street. These feats of fancy seem arbitrary enough and yet again harmlessly unsuspicious. Even when from them is produced, for the first time, the impulse to act, when the archæologist, oppressed by the problem whether such foot-position corresponds to reality, begins observations from life, in

looking at the feet of contemporary women and girls, this act covers itself by conscious, scientific motives, as if all the interest in the bas-relief of Gradiva had originated in his professional interest in archæology. The women and girls on the street, whom he uses as objects for his investigation, must, of course, assume a different, coarsely erotic conception of his conduct, and we must admit that they are right. For us, there is no doubt that Hanold knows as little about his motives as about the origin of his fancies concerning Gradiva. These latter are, as we shall learn later, echoes of his memories of the beloved of his youth, remnants of these memories, transformations and disfigurements of them, after they have failed to push into consciousness in unchanged form. The so-called æsthetic judgment that the relief represents "something of the present" is substituted for the knowledge that such a gait belongs to a girl known to him and crossing streets *in the present*; behind the impression "from life" and the fancy about her Greek traits, is hidden the memory of her name, Zoë, which, in Greek, means *life*; Gradiva is, as the man finally cured of the delusion tells us, a good translation of her family-name, Bertgang, which means *splendid or magnificent in walking*; the decisions about her father arise from the knowledge that Zoë Bertgang is the daughter of an esteemed university instructor, which is probably translated into the antique as temple service. Finally his imagination transports her to Pompeii not "because her calm, quiet manner seems to require it," but because, in his science, there is found no other nor better analogy to the remarkable condition in which he has traced out, by vague reconnoitring, his memories of his childhood friendship. If he once covered up what was so close to him, his own childhood, with the classic past, then the burial of Pompeii, this disappearance, with the preservation of the past, offers a striking resemblance to the *repression* of which he has knowledge by means of so-called "endopsychic" perceptions. The same symbolism, therefore, which the author has the girl use consciously at the end of the tale, is working in him.

"I said to myself that I should certainly dig up something interesting alone here. Of course, I had not reckoned at all on the find which I made." (G. .) At the end (G.), the girl answers to the announced desire about the destination of their journey, "by her childhood friend who had, in a way, also been excavated from the ashes."

Thus we find at the very beginning of the performances of Hanold's fancies and actions, a twofold determination, a derivation from two different sources. One determination is the one which appears to Hanold, himself; the other, the one which discloses itself to us upon re-examination of his psychic processes. One, the conscious one, is related to the person of Hanold; the other is the one entirely unconscious to him. One originates entirely from the series of associations connected with archæological science; the other, however, proceeds from the repressed memories which have become active in him, and the emotional impulses attached to them. The one seems superficial, and covers up the other, which masks itself behind the former. One might say that the scientific motivation serves the unconscious eroticism as cloak, and that science has placed itself completely at the service of the delusion, but one may not forget, either, that the unconscious determination can effect nothing but what is at the time satisfactory to the scientific conscious. The symptoms of delusion — fancies as well as acts — are results of a compromise between two psychic streams, and in a compromise the demands of each of the two parties are considered; each party has been obliged to forego something that he wished to carry out. Where a compromise has been established, there was a struggle, here the conflict assumed by us between the suppressed eroticism and the forces which keep it alive in the repression. In the formation of a delusion this struggle is never ended.

Attack and resistance are renewed after every compromise-formation, which is, so to speak, never fully satisfactory. This our author also knows and therefore he causes a feeling of discontent, a peculiar restlessness, to dominate his hero in this phase of the disturbance, as preliminary to and guarantee of further developments.

These significant peculiarities of the twofold determination for fancies and decisions, of the formation of conscious pretexts for actions, for the motivation of which the repressed has given the greater contribution, will, in the further progress of the story, occur to us oftener, and perhaps more clearly; and this rightfully, for in this Jensen has grasped and represented the never-failing, chief characteristic of the morbid psychic processes. The development of Norbert Hanold's delusion progresses in a dream, which, caused by no new event, seems to proceed entirely from his psychic life, which is occupied by a conflict. Yet let us stop before we proceed to test whether the author of *Gradiva,* in the formation of his dreams, meets our

expectation of a deeper understanding. Let us first ask what psychiatry has to say about his ideas of the origin of a delusion, how it stands on the matter of the rôle of repression and the unconscious, of conflict and compromise-formation. Briefly, can our author's representation of the genesis of a delusion stand before the judgment of science?

And here we must give the perhaps unexpected answer that, unfortunately, matters are here actually just reversed; science does not stand before the accomplishment of our author. Between the essential facts of heredity and constitution, and the seemingly complete creations of delusion, there yawns a breach which we find filled up by the writer of *Gradiva*. Science does not yet recognize the significance of repression nor the fact that it needs the unconscious for explanation to the world of psychopathological phenomena; it does not seek the basis of delusion in psychic conflict, and does not regard its symptoms as a compromise-formation. Then our author stands alone against all science? No, not that — if the present writer may reckon his own works as science. For he, himself, has for some years interceded — and until recently almost alone — for the views which he finds here in *Gradiva* by W. Jensen, and he has presented them in technical terms. He has pointed out exhaustively, for the conditions known as hysteria and obsession, the suppression of impulses and the repression of the ideas, through which the suppressed impulse is represented, as a characteristic condition of psychic disturbance, and he has repeated the same view soon afterwards for many kinds of delusion. Whether the impulses which are, for this reason, considered are always components of the sex-impulse, or might be of a different nature, is a problem of indifference in the analysis of *Gradiva*, as, in the case chosen by the author, it is a matter only of the suppression of the erotic feeling. The views concerning psychic conflict, and the formation of symptoms by compromises between the two psychic forces which are struggling with each other, the present writer has found valid in cases professionally treated and actually observed, in exactly the same way that he was able to observe it in Norbert Hanold, the invention of our author. The tracing back of neurotic, especially of hysterically morbid activities to the influence of unconscious thoughts, P. Janet, the pupil of the great Charcot, had undertaken before the present writer, and in conjunction with Josef Breuer in Vienna.

It had actually occurred to the present writer, when, in the years following 1893, he devoted himself to investigations of the origin of psychic disturbances, to seek confirmation of his results from authors, and therefore it was no slight surprise to him to learn that in *Gradiva*, published in 1903, an author gave to his creation the very foundation which the former supposed that he, himself, was finding authority for, as new, from his experiences as a physician. How did the author come upon the same knowledge as the physician, at least upon a procedure which would suggest that he possessed it?

Norbert Hanold's delusion, we said, acquires further development through a dream, which he has in the midst of his efforts to authenticate a gait like Gradiva's in the streets of his home-city. The content of this dream we can outline briefly. The dreamer is in Pompeii on that day which brought destruction to the unfortunate city, experiences the horrors without himself getting into danger, suddenly sees Gradiva walking there and immediately understands, as quite natural, that, as she is, of course, a Pompeiian, she is living in her native city and "without his having any suspicion of it, was his contemporary." He is seized with fear for her, calls to her, whereupon she turns her face toward him momentarily. Yet she walks on without heeding him at all, lies down on the steps of the Apollo temple, and is buried by the rain of ashes, after her face has changed colour as if it were turning to white marble, until it completely resembles a bas-relief. On awakening, he interprets the noise of the metropolis, which reaches his ear, as the cries for help of the desperate inhabitants of Pompeii and the booming of the turbulent sea. The feeling that what he has dreamed has really happened to him persists for some time after his awakening, and the conviction that Gradiva lived in Pompeii and died on that fatal day remains from this dream as a new, supplementary fact for his delusion.

It is less easy for us to say what the author of *Gradiva* intended by this dream, and what caused him to connect the development of this delusion directly with a dream. Assiduous investigation of dreams has, to be sure, gathered enough examples of the fact that mental disturbance is connected with and proceeds from dreams, and even in the life-history of certain eminent men, impulses for important deeds and decisions are said to have been engendered by dreams; but our comprehension does not gain much by these analogies; let us hold, therefore, to our case, the case of the

archæologist, Norbert Hanold, a fiction of our author. At which end must one lay hold of such a dream to introduce meaning into it, if it is not to remain an unnecessary adornment of fiction? I can imagine that the reader exclaims at this place: “The dream is, of course, easy to explain — a simple anxiety-dream, caused by the noise of the metropolis, which is given the new interpretation of the destruction of Pompeii, by the archæologist busied with his Pompeiian girl!” On account of the commonly prevailing disregard of the activities of dreams, one usually limits the demands for dream-explanations so that one seeks for a part of the dream-content an external excitation which covers itself by means of the content. This external excitation for the dream would be given by the noise which wakens the sleeper; the interest in this dream would be thereby terminated. Would that we had even one reason to suppose that the metropolis had been noisier than usual on this morning! If, for example, our author had not omitted to inform us that Hanold had that night, contrary to his custom, slept by an open window! What a shame that our author didn’t take the trouble! And if an anxiety-dream were only so simple a thing! No, this interest is not terminated in so simple a way.

The connection with the external, sensory stimulus is not at all essential for the dream-formation. The sleeper can neglect this excitation from the outer world; he may be awakened by it without forming a dream, he may also weave it into his dream, as happens here, if it is of no use to him from any other motive; and there is an abundance of dreams for whose content such a determination by a sensory excitation of the sleeper cannot be shown. No, let us try another way.

Perhaps we can start from the residue which the dream leaves in Hanold’s waking life. It had formerly been his fancy that Gradiva was a Pompeiian. Now this assumption becomes a certainty and the second certainty is added that she was buried there in the year 79. Sorrowful feelings accompany this progress of the formation of the delusion like an echo of the fear which had filled the dream. This new grief about Gradiva will seem to us not exactly comprehensible; Gradiva would now have been dead for many centuries even if she had been saved in the year 79 from destruction. Or ought one to be permitted to squabble thus with either Norbert Hanold or his creator? Here, too, no way seems to lead to explanation. We wish, nevertheless, to remark that a very painful,

emotional stress clings to the augmentation which the delusion derives from this dream.

Otherwise, however, our perplexity is not dispelled. This dream does not explain itself; we must decide to borrow from *Traumdeutung* by the present writer, and to use some of the rules given there for the solution of dreams.

One of these rules is that a dream is regularly connected with the day before the dream. Our author seems to wish to intimate that he has followed this rule by connecting the dream directly with Hanold's "pedestrian investigations." Now the latter means nothing but a search for Gradiva whom he expects to recognize by her characteristic manner of walking. The dream ought, therefore, to contain a reference to where Gradiva is to be found. It really does contain it by showing her in Pompeii, but that is no news for us.

Another rule says: If, after the dream, the reality of the dream-pictures continues unusually long so that one cannot free himself from the dream, this is not a kind of mistake in judgment called forth by the vividness of the dream-pictures, but is a psychic act in itself, an assurance which refers to the dream-content, that something in it is as real as it has been dreamed to be, and one is right to believe this assurance. If we stop at these two rules, we must decide that the dream gives real information about the whereabouts of Gradiva, who is being sought. We now know Hanold's dream; does the application of these two rules lead to any sensible meaning?

Strange to say, yes. This meaning is disguised only in a special way so that one does not recognize it immediately. Hanold learns in the dream that the girl sought lives in the city and in his own day. That is, of course, true of Zoë Bertgang, only that in his dream the city is not the German university-city, but Pompeii, the time not the present, but the year 79, according to our reckoning. It is a kind of disfigurement by displacement; not Gradiva is transported to the present, but the dreamer to the past; but we are also given the essential and new fact *that he shares locality and time with the girl sought*. Whence, then, this dissimulation and disguise which must deceive us as well as the dreamer about the peculiar meaning and content of the dream? Well, we have already means at hand to give us a satisfactory answer to this question.

Let us recall all that we have heard about the nature and origin of fancies, these preliminaries of delusion. They are substitution for and remnants of different repressed memories, which a resistance does not allow to push into consciousness, which, however, become conscious by heeding the censor of resistance, by means of transformations and disfigurements. After this compromise is completed, the former memories have become fancies, which may easily be misunderstood by the conscious person, that is, may be understood to be the ruling psychic force. Now let us suppose that the dream-pictures are the so-called physiological delusion-products of a man, the compromise-results of that struggle between what is repressed and what is dominant, which exist probably even in people absolutely normal in the daytime. Then we understand that we have to consider the dream something disfigured behind which there is to be sought something else, not disfigured, but, in a sense, something offensive, like Hanold's repressed memories behind his fancies. One expresses the admitted opposition by distinguishing what the dreamer remembers on waking, as manifest dream-content, from what formed the basis of the dream before the censor's disfigurement, the latent dream-thoughts. To interpret a dream, then, means to translate the manifest dream-content into the latent dream-thoughts, which make retrogressive the disfigurement that had to be approved by the resistance censor. When we turn these deliberations to the dream which is occupying us, we find that the latent dream-thoughts must have been as follows: "The girl who has that beautiful walk, whom you are seeking, lives really in this city with you;" but in this form the thought could not become conscious; in its way there stood the fact that a fancy had established, as a result of a former compromise, the idea that Gradiva was a Pompeiian girl, and therefore nothing remained, if the actual fact of her living in the same locality and at the same time was to be perceived, but to assume the disfigurement: you are living in Pompeii at the time of Gradiva; and this then is the idea which the manifest dream-content realizes and represents as a present time which he is living in.

A dream is rarely the representation, one might say the staging, of a single thought, but generally of a number of them, a web of thoughts. In Hanold's dream there is conspicuous another component of the content, whose disfigurement is easily put aside so that one may learn the latent idea represented by it. This is the end of the dream to which the assurance

of reality can also be extended. In the dream the beautiful walker, Gradiva, is transformed into a bas-relief. That is, of course, nothing but an ingenious and poetic representation of the actual procedure. Hanold had, indeed, transferred his interest from the living girl to the bas-relief; the beloved had been transformed into a stone relief. The latent dream-thoughts, which remain unconscious, wish to transform the relief back into the living girl; in connection with the foregoing they speak to him somewhat as follows: “You are, of course, interested in the bas-relief of Gradiva only because it reminds you of the present, here-living Zoë.” But this insight would mean the end of the delusion, if it could become conscious.

Is it our duty to substitute unconscious thoughts thus for every single bit of the manifest dream-content? Strictly speaking, yes; in the interpretation of a dream which had actually been dreamed, we should not be allowed to avoid this duty. The dreamer would then have to give us an exhaustive account. It is easily understood that we cannot enforce such a demand in connection with the creature of our author; we will not, however, overlook the fact that we have not yet submitted the chief content of this dream to the work of interpretation and translation.

Hanold’s dream is, of course, an anxiety-dream. Its content is fearful; anxiety is felt by the dreamer in sleep, and painful feelings remain after it. That is not of any great help for our attempt at explanation; we are again forced to borrow largely from the teachings of dream-interpretation. This admonishes us not to fall into the error of deriving the fear that is felt in a dream from the content of a dream, not to use the dream-content like the content of ideas of waking life. It calls to our attention how often we dream the most horrible things without feeling any trace of fear. Rather the true fact is a quite different one, which cannot be easily guessed, but can certainly be proved. The fear of the anxiety-dream corresponds to a sex-feeling, a libidinous emotion, like every neurotic fear, and has, through the process of repression, proceeded from the libido. In the interpretation of dreams, therefore, one must substitute for fear sexual excitement. The fear which has thus come into existence, exercises now — not regularly, but often — a selective influence on the dream-content and brings into the dream ideational elements which seem suitable to this fear for the conscious and erroneous conception of the dream. This is, as has been said, by no means regularly the case, for there are anxiety dreams in

which the content is not at all frightful, in which, therefore, one cannot explain consciously the anxiety experienced.

I know that this explanation of fear in dreams sounds odd, and is not easily believed; but I can only advise making friends with it. It would, moreover, be remarkable if Norbert Hanold's dream allowed itself to be connected with this conception of fear and to be explained by it. We should then say that in the dreamer, at night, the erotic desire stirs, makes a powerful advance to bring his memory of the beloved into consciousness and thus snatch him from the delusion, experiences rejection and transformation into fear, which now, on its part, brings the fearful pictures from the academic memory of the dreamer into the dream-content. In this way the peculiar unconscious content of the dream, the amorous longing for the once known Zoë, is transformed into the manifest-content of the destruction of Pompeii and the loss of Gradiva.

I think that sounds quite plausible so far. One might justly demand that if erotic wishes form the undisfigured content of this dream, then one must be able to point out, in the transformed dream, at least a recognizable remnant of them hidden somewhere. Well, perhaps even this will come about with the help of a suggestion which appears later in the story. At the first meeting with the supposed Gradiva, Hanold remembers this dream and requests the apparition to lie down again as he has seen her. Thereupon the young lady rises, indignant, and leaves her strange companion, in whose delusion-ridden speech she has heard the suggestion of an improper erotic wish. I think we may adopt Gradiva's interpretation; even from a real dream one cannot always demand more definiteness for the representation of an erotic wish.

Thus the application of some rules of dream-interpretation have been successful on Hanold's first dream, in making this dream comprehensible to us in its chief features, and in fitting it into the sequence of the story. Then it must probably have been produced by its author with due consideration for these rules. One could raise only one more question: why the author should introduce a dream for further development of the delusion. Well, I think that is very cleverly arranged and again keeps faith with reality. We have already heard that in actual illness the formation of a delusion is very often connected with a dream, but after our explanation of the nature of dreams, we need find no new riddle in this fact. Dreams and delusion spring from the same source, the repressed; the dream is, so to

speak, the physiological delusion of the normal human being. Before the repressed has become strong enough to push itself up into waking life as delusion, it may easily have won its first success under the more favourable circumstances of sleep, in the form of a dream having after-effects. During sleep, with the diminution of psychic activity, there enters a slackening in the strength of the resistance, which the dominant psychic forces oppose to the repressed. This slackening is what makes the dream-formation possible and therefore the dream becomes, for us, the best means of approach to knowledge of the unconscious psyche. Only the dream usually passes rapidly with the re-establishment of the psychic revival of waking life, and the ground won by the unconscious is again vacated.

III

In the further course of the story there is another dream, which can tempt us, even more perhaps than the first, to try to interpret it and fit it into the psychic life of the hero; but we save little if we leave the representation of the author of *Gradiva* here, to hasten directly to this second dream, for whoever wishes to interpret the dream of another, cannot help concerning himself, as extensively as possible, with every subjective and objective experience of the dreamer. Therefore it would be best to hold to the thread of the story and provide this with our commentaries as we progress.

The new delusion of the death of Gradiva at the destruction of Pompeii in the year 79 is not the only after-effect of the first dream analysed by us. Directly afterwards Hanold decides upon a trip to Italy, which finally takes him to Pompeii. Before this, however, something else has happened to him; leaning from his window, he thinks he sees on the street a figure with the bearing and walk of his Gradiva, hastens after her, in spite of his scanty attire, does not overtake her, but is driven back by the jeers of the people on the street. After he has returned to his room, the song of a canary whose cage hangs in the window of the opposite house calls forth in him a mood such as if he wished to get from prison into freedom, and the spring trip is immediately decided upon and accomplished.

Our author has put this trip of Hanold’s in an especially strong light, and has given to the latter partial clearness about his subjective processes. Hanold has, of course, given himself a scientific purpose for his journey,

but this is not substantial. Yet he knows that the “impulse to travel has originated in a nameless feeling.” A peculiar restlessness makes him dissatisfied with everything he encounters and drives him from Rome to Naples, from there to Pompeii, without his mood’s being set right, even at the last halting-place. He is annoyed by the foolishness of honeymoon travellers, and is enraged over the boldness of house-flies, which populate the hotels of Pompeii; but finally he does not deceive himself over the fact that “his dissatisfaction was certainly not caused by his surroundings alone, but, to a degree, found its origin in him.” He considers himself over-excited, feels “that he was out of sorts because he lacked something without being able to explain what, and this ill-humour he took everywhere with him.” In such a mood he is enraged even at his mistress, science; as he wanders for the first time in the glow of the midday sun through Pompeii, all his science had left him without the least desire to rediscover it; “he remembered it as from a great distance, and he felt that it had been an old, dried-up, boresome aunt, dullest and most superfluous creature in the world.” (G. .)

In this uncomfortable and confused state of mind, one of the riddles which are connected with this journey is solved for him at the moment when he first sees Gradiva walking through Pompeii; “he became conscious, for the first time, that he had, without himself knowing the motive in his heart, come to Italy on that account and had, without stop, continued from Rome and Naples to Pompeii to see if he could here find trace of her — and that in a literal sense — for, with her unusual gait, she must have left behind in the ashes a foot-print different from all the others.” (G. .)

As our author has put so much care into the delineation of this trip, it must be worth our while to explain its relation to Hanold’s delusion and its place in the sequence of events. The journey is undertaken for motives which the character does not at first recognize and does not admit until later, motives which our author designates directly as “unconscious.” This is certainly true to life; one does not need to have a delusion to act thus; rather it is an everyday occurrence, even for normal people, that they are deceived about the motives of their actions and do not become conscious of them until subsequently, when a conflict of several emotional currents re-establishes for them the condition for such confusion. Hanold’s trip, therefore, was intended, from the beginning, to serve the delusion, and was

to take him to Pompeii to continue there the search for Gradiva. Let us remember that before, and directly after the dream, this search filled his mind and that the dream itself was only a stifled answer of his consciousness to the question of the whereabouts of Gradiva. Some force which we do not recognize, however, next prevents the plan of the delusion from becoming conscious, so that only insufficient pretexts, which can be but partially revived, remain as a conscious motivation for the trip. The author gives us another riddle by having the dream, the discovery of the supposed Gradiva on the street, and the decision to make the journey because of the influence of the singing canary follow one another like chance occurrences without inner coherence.

With the help of the explanations which we gather from the later speeches of Zoë Bertgang, this obscure part of the tale is illuminated for our understanding. It was really the original of Gradiva, Miss Zoë, herself, whom Hanold saw from his window walking on the street (G.), and whom he would soon have overtaken. The statement of the dreamer— “she is really living now in the present, in the same city with you,” — would, therefore, by a lucky chance, have experienced an irrefutable corroboration, before which his inner resistance would have collapsed. The canary, however, whose song impelled Hanold to go away, belonged to Zoë, and his cage was in her window, in the house diagonally opposite from Hanold’s (G.). Hanold, who, according to the girl’s arraignment, was endowed with negative hallucination, understood the art of not seeing nor recognizing people, and must from the beginning have had unconscious knowledge of what we do not discover until later. The signs of Zoë’s proximity, her appearance on the street, and her bird’s song so near his window intensify the effect of the dream, and in this condition, so dangerous for his resistance to the eroticism, he takes flight. The journey arises from the recovery of the resistance after that advance of erotic desire in the dream, an attempt at flight from the living and present beloved. It means practically a victory for repression, which, this time, in the delusion keeps the upper hand, as, in his former action, the “pedestrian investigations” of women and girls, the eroticism had been victorious. Everywhere, however, the indecision of the struggle, the compromise nature of the results was evident; the trip to Pompeii, which is to take him away from the living Zoë leads, at any rate, to her substitute, Gradiva. The journey, which is undertaken in defiance of the most recent dream-

thoughts, follows, however, the order of the manifest dream-content to Pompeii. Thus delusion triumphs anew every time that eroticism and resistance struggle anew.

This conception of Hanold's trip, as a flight from the erotic desire for the beloved, who is so near, which is awakening in him, harmonizes, however, with the frame of mind portrayed in him during his stay in Italy. The rejection of the eroticism, which dominates him, expresses itself there in his abhorrence of honeymoon travellers. A little dream in the "albergo" in Rome, caused by the proximity of a couple of German lovers, "Augustus" and "Gretchen," whose evening conversation he is forced to overhear through the thin partition, casts a further light on the erotic tendencies of his first great dream. The new dream transports him again to Pompeii where Vesuvius is just having another eruption, and thus refers to the dream which continues active during his trip; but among the imperilled people he sees this time — not as before himself and Gradiva — but Apollo Belvedere and the Capitoline Venus, — doubtless ironic exaltation of the couple in the adjoining room. Apollo lifts Venus, carries her away, and lays her on an object in the dark, which seems to be a carriage or a cart, for a "rattling sound" comes from it. Otherwise the dream needs no special skill for its interpretation. (G. .)

Our author, whom we have long relied on not to make a single stroke in his picture idly and without purpose, has given us another bit of testimony for the non-sexual force dominating Hanold on the trip. During hours of wandering in Pompeii, it happens that "remarkably, it did not once appear in his memory that he had dreamed some time ago that he had been present at the destruction of Pompeii by the volcanic eruption of 79." (G. .) At sight of Gradiva he first suddenly remembers this dream, and at the same time the motive of the delusion for his puzzling journey becomes conscious. Then what other meaning could there be for forgetting the dream, this repression-boundary between the dream and the psychic condition of the journey, than that the journey is not the result of the direct instigation of the dream, but of the rejection of this latter, as the emanation from a psychic force which desires no knowledge of the secret meaning of the dream?

On the other hand, however, Hanold is not happy at this victory over his eroticism. The suppressed psychic impulse remains strong enough to revenge itself, by discontent and interception, on the suppressing agency.

His longing has changed to restlessness and dissatisfaction, which make the trip seem senseless to him. His insight into the motivation of his trip is obstructed in service of the delusion; his relation to science, which ought, in such a place, to stir all his interest, is upset. So our author shows his hero, after flight from love, in a sort of crisis, in an utterly confused and unsettled condition, in a derangement such as usually appears at the climax of illness if neither of the two struggling forces is so much stronger than the other, that the difference could establish a strict, psychic régime. Here then our author takes hold to help and to settle, for, at this place, he introduces Gradiva, who undertakes the cure of the delusion. With his power to direct to a happy solution the fortunes of all the characters created by him, in spite of all the requirements which he has them conform to, he transports the girl, from whom Hanold has fled to Pompeii, to that very place and thus corrects the folly which the delusion caused the young man to commit in leaving the home-city of his beloved for the dead abode of the one substituted for her by his fancy.

With the appearance of Zoë Bertgang as Gradiva, which marks the climax of the suspense of the story, our interest is soon diverted. If we have hitherto been living through the developments of a delusion, we shall now become witnesses of its cure, and may ask ourselves if our author has merely invented the procedure of this cure or has carried it out according to actually existing possibilities. From Zoë's own words in the conversation with her friend, we have decidedly the right to ascribe to her the intention to cure the hero (G.). But how does she go about it? After she has cast aside the indignation which the unreasonable request, to lie down to sleep again, as "then," had evoked in her, she appears again next day, at the same place, and elicits from Hanold all the secret knowledge that was lacking to her for an understanding of his conduct of the previous day. She learns of his dream, of the bas-relief of Gradiva, and of the peculiarity of walk which she shares with the relief. She accepts the rôle of a spirit awakened to life for a short hour, which, she observes, his delusion assigns to her, and in ambiguous words, she gently puts him in the way of a new rôle by accepting from him the grave-flower which he had brought along without conscious purpose, and expresses regret that he has not given her roses (G.).

Our interest in the conduct of the eminently clever girl, who has decided to win the lover of her youth as husband, after she has recognized

his love behind his delusion as its impelling force, is, however, restrained at this place probably because of the strange feelings that the delusion can arouse even in us. Its latest development, that Gradiva, who was buried in the year 79, can now exchange conversation with him as a noon-spirit, for an hour, after the passing of which she sinks out of sight or seeks her grave again, this chimæra, which is not confused by the perception of her modern foot-covering, nor by her ignorance of the ancient tongues, nor by her command of German, which did not exist in former times, seems indeed to justify the author's designation, "A Pompeiian Fancy," but to exclude every standard of clinical reality; and yet on closer consideration the improbability in this delusion seems to me, for the most part, to vanish. To be sure, our author has taken upon himself a part of the blame, and in the first part of the story has offered the fact that Zoë was the image of the bas-relief in every trait. One must, therefore, guard against transferring the improbability of this preliminary to its logical conclusion that Hanold considers the girl to be Gradiva come to life. The explanation of the delusion is here enhanced by the fact that our author has offered us no rational disposal of it. In the glowing sun of the Campagna and in the bewildering magic powers of the vine which grows on Vesuvius, our author has introduced helpful and mitigating circumstances of the transgression of the hero. The most important of all explanatory and exonerating considerations remains, however, the facility with which our intellect decides to accept an absurd content if impulses with a strong emotional stress find thereby their satisfaction. It is astonishing, and generally meets with too little acceptance, how easily and often intelligent people, under such psychological constellations, give the reactions of partial mental weakness, and any one who is not too conceited may observe this in himself as often as he wishes, and especially when a part of the thought-processes under consideration is connected with unconscious or repressed motives. I cite, in this connection, the words of a philosopher who writes to me, "I have also begun to make note of cases of striking mistakes, from my own experience, and of thoughtless actions which one subsequently explains to himself (in a very unreasonable way). It is amazing but typical how much stupidity thereby comes to light." Now let us consider the fact that belief in spirits, apparitions and returning souls (which finds so much support in the religions to which, at least as children, we have all clung) is by no means destroyed among all educated

people, and that many otherwise reasonable people find their interest in spiritism compatible with their reason. Yes, even one become dispassionate and incredulous may perceive with shame how easily he turns back for a moment to a belief in spirits, when emotions and perplexity concur in him. I know of a physician who had once lost a patient by Basedow's disease and could not rid himself of the slight suspicion that he had perhaps contributed by unwise medication to the unfortunate outcome. One day several years later there stepped into his office a girl, in whom, in spite of all reluctance, he was obliged to recognize the dead woman. His only thought was that it was true that the dead could return, and his fear did not give way to shame until the visitor introduced herself as the sister of the woman who had died of that disease. Basedow's disease lends to those afflicted with it a great similarity of features, which has often been noticed, and in this case the typical resemblance was far more exaggerated than the family resemblance. The physician, moreover, to whom this happened was I, and therefore I am not inclined to quarrel with Norbert Hanold over the clinical possibility of his short delusion about Gradiva, who had returned to life. That in serious cases of chronic delusion (paranoia) the most extreme absurdities, ingeniously devised and well supported, are active is, finally, well known to every psychiatrist.

After his first meeting with Gradiva, Norbert Hanold had drunk his wine in first one and then another of the hotels of Pompeii known to him, while the other guests were having their regular meals. "Of course, in no way had the absurd supposition entered his mind" that he was doing this to find out what hotel Gradiva lived and ate in, but it is hard to say what other significance his action could have. On the day after his second meeting in Meleager's house, he has all sorts of remarkable and apparently disconnected experiences; he finds a narrow cleft in the wall of the portico where Gradiva had disappeared, meets a foolish lizard-catcher, who addresses him as an acquaintance, discovers a secluded hotel, the "Albergo del Sole," whose owner talks him into buying a metal brooch encrusted with green patina, which had been found with the remains of a Pompeiian girl, and finally notices in his own hotel a newly-arrived young couple, whom he diagnoses to be brother and sister, and congenial. All these impressions are then woven into a "remarkably nonsensical" dream as follows:

“Somewhere in the sun Gradiva sat making a trap out of a blade of grass in order to catch a lizard, and she said, ‘Please stay quite still — my colleague is right; the method is really good and she has used it with the greatest success.’”

To this dream he offers resistance even while sleeping, with the critique that it is indeed the most utter madness, and he casts about to free himself from it. He succeeds in doing this, too, with the aid of an invisible bird who utters a short, merry call, and carries the lizard away in his beak.

Shall we risk an attempt to interpret this dream also, that is, to substitute for it the latent thoughts from whose disfigurement it must have proceeded? It is as nonsensical as one could expect a dream to be and this absurdity of dreams is the mainstay of the view which denies to the dream the character of a valid psychic act, and has it proceed from a desultory stimulus of the psychic elements.

We can apply to this dream the technique which can be designated as the regular procedure of dream-interpretation. It consists in disregarding the apparent sequence in the manifest dream but in examining separately every part of the content, and in seeking its derivation in the impressions, memories and free ideas of the dreamer. As we cannot examine Hanold, however, we must be satisfied with reference to his impressions, and may with due caution substitute our own ideas for his.

“Somewhere in the sun Gradiva sat catching lizards, and said ...” What impression of the day is this part of the dream reminiscent of? Unquestionably of the meeting with the older man, the lizard-catcher, for whom Gradiva is substituted in the dream. He was sitting or lying on a “hot, sunny” slope and spoke to Hanold, too. Even the utterances of Gradiva in the dream are copied from those of the man. Let us compare: “‘The method suggested by my colleague, Eimer, is really good; I have already used it often with the best of success. Please remain quite still.’” — Quite similarly Gradiva speaks in the dream, only that for the *colleague, Eimer*, is substituted an unnamed woman-colleague; the *often* from the zoologist’s speech is missing in the dream, and the connection between the statements has been somewhat changed. It seems, therefore, that this experience of the day has been transformed into a dream by some changes and disfigurements. Why thus, and what is the meaning of the disfigurements, the substitution of Gradiva for the old gentleman, and the introduction of the puzzling “woman-colleague”?

There is a rule of dream-interpretation as follows: A speech heard in a dream always originates from a speech either heard or uttered in waking life. Well, this rule seems followed here; the speech of Gradiva is only a modification of a speech heard in the daytime from the zoologist. Another rule of dream-interpretation would tell us that the substitution of one person for another, or the mixture of two people by showing one in a position which characterizes the other means equivalence of the two people, a correspondence between them. Let us venture to apply this rule also to our dream; then the interpretation would follow: “Gradiva catches lizards, as that old gentleman does, and like him, is skilled in lizard-catching.” This result is not comprehensible yet, but we have another riddle before us. To which impression of the day shall we refer the “woman colleague,” who is substituted in the dream for the famous zoologist, Eimer? We have here fortunately not much choice; only one other girl can be meant by “woman-colleague,” the congenial young lady in whom Hanold has conjectured a sister travelling with her brother. “In her gown she wore a red Sorrento rose, the sight of which, as he looked across from his corner, stirred something in his memory without his being able to think what it was.” This observation on the part of the author surely gives us the right to assert that she is the “woman-colleague” of the dream. What Hanold cannot remember is certainly nothing but the remark of the supposed Gradiva, as she asked him for the grave-flower, that to more fortunate girls one brought roses in spring. In this speech, however, lay a hidden wooing. What kind of lizard-catching is it that this more fortunate woman-colleague has been so successful with?

On the next day Hanold surprises the supposed brother and sister in tender embrace and can thus correct his mistake of the previous day. They are really a couple of lovers, on their honeymoon, as we later learn, when the two disturb, so unexpectedly, Hanold’s third meeting with Zoë. If we will now accept the idea that Hanold, who consciously considers them brother and sister, has, in his unconscious, recognized at once their real relation, which on the next day betrays itself so unequivocally, there results a good meaning for Gradiva’s remark in the dream. The red rose then becomes a symbol for being in love; Hanold understands that the two are as Gradiva and he are soon to be; the lizard-catching acquires the meaning of husband-catching, and Gradiva’s speech means something like

this: “Let me arrange things; I know how to win a husband as well as this other girl does.”

Why must this penetration of Zoë’s intentions appear throughout in the form of the speech of the old zoologist? Why is Zoë’s skill in husband-catching represented by that of the old man in lizard-catching? Well, it is easy for us to answer that question; we have long ago guessed that the lizard-catcher is none other than the professor of zoology, Bertgang, Zoë’s father, who must, of course, also know Hanold, so that it is a matter of course that he addresses Hanold as an acquaintance. Again, let us accept the idea that Hanold, in his unconscious, immediately recognizes the professor— “It seemed to him dimly that he had already seen the face of the lizard-hunter probably in one of the two hotels.” Thus is explained the strange cloaking of the purpose attributed to Zoë. She is the daughter of the lizard-catcher; she has inherited this skill from him. The substitution of Gradiva for the lizard-catcher in the dream-content, is, therefore, the representation of the relation between the two people, which was recognized by the unconscious; the introduction of “woman-colleague” in place of *colleague, Eimer*, allows the dream to express comprehension of her courtship of the man. The dream has welded two of the day’s experiences in one situation, “condensed” as we say, in order to procure, to be sure, very indiscernible expression for two ideas which are not allowed to become conscious; but we can go on diminishing the strangeness of the dream still more and pointing out the influence of other experiences of the day on the formation of the manifest dream.

Dissatisfied by the former information, we might explain why the scene of the lizard-catching was made the nucleus of the dream, and suppose that the other elements in the dream-thoughts influence the term “lizard” in the manifest dream. It might really be very easy. Let us recall that Hanold has discovered a cleft in the wall, in the place where Gradiva seems to him to disappear; this is “wide enough to afford passage to an unusually slender figure.” By this perception he is forced in the day-time to an alteration in his delusion; Gradiva did not sink into the ground when she disappeared from his sight, but was going back, by this route, to her grave. In his unconscious thought he might say to himself that he had now found the natural explanation for the surprising disappearance of the girl; but must not forcing one’s self through narrow clefts, and disappearing in such clefts recall the conduct of lizards? Does not Gradiva herself, then, in this

connection, behave like an agile little lizard? We think, therefore, that the discovery of this cleft in the wall had worked as a determinant on the choice of the “lizard” element for the manifest dream-content; the lizard-situation of the dream, therefore, represented this impression of the day, and the meeting with the zoologist, Zoë’s father.

What if, become bold, we now wished to attempt to find in the dream-content a representation also for the one experience of the day which has not yet been turned to account, the discovery of the third hotel, “del Sole”? Our author has treated this episode so exhaustively and linked so much with it, we should be surprised if it, alone, had yielded no contribution to the dream-formation. Hanold enters this hotel, which, because of its secluded situation and its distance from the station, has remained unknown to him, to get a bottle of lime-water for congestion of blood. The hotel-keeper uses this opportunity to extol his antiques and shows him a brooch which, it was alleged, had belonged to that Pompeiian girl who was found near the Forum in fond embrace with her lover. Hanold, who had never before believed this frequently repeated story, is now compelled, by a force strange to him, to believe in the truth of this touching story and in the genuineness of the article found, buys the brooch and leaves the hotel with his purchase. In passing, he sees nodding down at him from one of the windows a cluster of white, asphodel blossoms which had been placed in a water-glass, and he feels that this sight is an attestation of the genuineness of his new possession. The sincere conviction is now impressed upon him that the green brooch belonged to Gradiva, and that she was the girl who died in her lover’s embrace. The tormenting jealousy, which thereupon seizes him, he appeases with the resolution to assure himself about this suspicion, the next day, from Gradiva, herself, by showing the brooch. This is a strange bit of new delusion; and shouldn’t any trace point to it in the dream of the following night?

It will be well worth our while to get an understanding of the origin of this augmentation of the delusion, to look up the new unconscious idea for which the new bit of delusion is substituted. The delusion originates under the influence of the proprietor of the “Sun Hotel,” toward whom Hanold conducts himself in so remarkably credulous a manner, as if he has received a suggestion from him. The proprietor shows him a small metal brooch as genuine, and as the possession of that girl who was found in the arms of her lover, buried in the ashes, and Hanold, who could be critical

enough to doubt the truth of the story as well as the genuineness of the brooch, is caught, credulous, and buys the more than doubtful antique. It is quite incomprehensible why he should act so, and no hint is given that the personality of the proprietor himself might solve this riddle for us. There is, however, another riddle in this incident, and two riddles sometimes solve each other. On leaving the “albergo,” he catches sight of an asphodel cluster in a glass at a window, and finds in it an attestation of the genuineness of the metal brooch. How can that be? This last stroke is fortunately easy of solution. The white flower is, of course, the one which he presented to Gradiva at noon, and it is quite right that through the sight of it at one of the windows of this hotel, something is corroborated, not the genuineness of the brooch, but something else which has become clear to him at the discovery of this formerly overlooked “albergo.” In the forenoon he has already acted as if he were seeking, in the two hotels of Pompeii, where the person lived who appeared to him as Gradiva. Now, as he stumbles so unexpectedly upon a third, he must say in the unconscious: “So she lives here”; and then, on leaving: “Right there is the asphodel flower I gave her; that is, therefore, her window.” This, then, is the new idea for which the delusion is substituted, and which cannot become conscious because its assumption that Gradiva is living, a person known by him, cannot become conscious.

How then is the substitution of the delusion for the new idea supposed to have occurred? I think thus: that the feeling of conviction which clung to the idea was able to assert itself and persisted, while another ideational content related to it by thought-connection acted as substitute for the idea itself which was incapable of consciousness. Thus the feeling of conviction was connected with a really strange content, and this latter attained, as delusion, a recognition which did not belong to it. Hanold transfers his conviction that Gradiva lives in this house to other impressions which he receives in this house, becomes, in a way, credulous about what the proprietor says, the genuineness of the metal brooch, and the truth of the anecdote about the lovers found in an embrace, but only by this route, that he connects what he has heard in this house with Gradiva. The jealousy which has been lying ready in him gets possession of this material, and even in contradiction to his first dream there appears the delusion that Gradiva was the girl who died in the arms of her lover, and that the brooch which he bought belonged to her.

We notice that the conversation with Gradiva, and her gentle wooing "through the flower," have already evoked important changes in Hanold. Traits of male desire, components of the libido are awakened in him, which, to be sure, cannot yet dispense with the concealment through conscious pretexts; but the problem of the corporeal nature of Gradiva, which has pursued him this whole day, cannot disavow its derivation from the erotic desire of the young man for possession of the woman, even if it is dragged into the scientific world by conscious stress on Gradiva's peculiar hovering between life and death. Jealousy is an added mark of Hanold's awakening activity in love; he expresses this at the opening of the conversation on the next day, and with the aid of a new pretext achieves his object of touching the girl's body, and of striking her, as in times long past.

Now, however, it is time to ask if the course of delusion-formation which we have inferred from our author's representation is one otherwise admitted or possible. From my experience as physician, I can answer only that it is surely the right way, perhaps the only one, in which the delusion receives the unswerving recognition due to its clinical character. If the patient believes in his delusion so firmly, it does not happen because of inversion of his powers of judgment, and does not proceed from what is erroneous in the delusion; but in every delusion there lies also a little grain of truth; there is something in it which really deserves belief, and this is the source of the conviction of the patient, who is, to this extent, justified. This true element, however, has been repressed for a long time; if it finally succeeds in pushing into consciousness (this time in disfigured form), the feeling of a conviction clinging to it, as if in compensation, is over-strong and now clings to and protects the disfigurement-substitute of the repressed, true element against every critical impugnment. The conviction at once shifts itself from the unconscious, true element to the conscious, erroneous one connected with it, and remains fixed there as a result of this very displacement. The case of delusion-formation which resulted from Hanold's first dream is nothing but a similar, if not identical, case of such displacement. Yes, the depicted manner of development of conviction in the delusion is not fundamentally different from the way in which conviction is formed in normal cases, where repression does not enter into play. All our convictions lie in thought-contents in which the true and the false are combined and *they stretch over the former and the latter*. They

differentiate at once between the true and whatever false is associated with it and protect this, even if not so immutably as in the delusion, against merited critique. Associations, protection, likewise, have their own value even for normal psychology.

I will now return to the dream and lay stress on a small, but not uninteresting feature which establishes a connection between two occasions of the dream. Gradiva had placed the white asphodel flower in definite contrast to the red rose; the finding of the asphodel flower again in the window of the "Albergo del Sole" becomes a weighty proof for Hanold's unconscious idea which expresses itself in a new delusion; and to this is added the fact that the red rose in the dress of the congenial young girl helps Hanold again, in the unconscious, to a right estimation of her relation to her companion so that he can have her enter the dream as "woman colleague."

But where in the manifest dream-content is found the trace and representation of that discovery of Hanold's for which we find that the new delusion is substituted, the discovery that Gradiva lives with her father in the third hotel of Pompeii, the "Albergo del Sole," which he has not been acquainted with? Well, it stands in its entirety and not even much disfigured in the dream; but I dread to point it out, for I know that even with the readers whose patience with me has lasted so long, a strong opposition to my attempts at interpretation will be stirred up. Hanold's discovery is given in full in the dream-content, I repeat, but so cleverly concealed that one must needs overlook it. It is hidden there behind a play on words, an ambiguity. "Somewhere in the sun Gradiva sat"; this we have rightly connected with the locality where Hanold met the zoologist, her father; but can it not also mean in the "Sun," that is, in the "Albergo del Sole," in the "Sun Hotel" Gradiva lives? And doesn't the "somewhere" which has no reference to the meeting with her father sound so hypocritically indefinite for the very reason that it introduces the definite information about the whereabouts of Gradiva? According to previous experience in the interpretation of real dreams, I am quite sure of such a meaning in the ambiguity, but I should really not venture to offer this bit of interpretation to my readers, if our author did not lend me here his powerful assistance. On the next day he puts into the mouth of the girl, when she sees the metal brooch, the same pun which we accept for the interpretation of the dream-content. "Did you find it in the sun, perhaps? It

brings to light many such works of art"; and as Hanold does not understand the speech, she explains that she means the "Sun Hotel," which is called "Sole" here, whence the supposed antique is also familiar to her.

And now may we make the attempt to substitute for Hanold's "remarkably nonsensical" dream unconscious thoughts hidden behind it and as unlike it as possible? It runs somewhat as follows: "She lives in the 'Sun' with her father; why is she playing such a game with me? Does she wish to make fun of me? Or could it be possible that she loves me and wishes me for a husband?" To this latter possibility there now follows in sleep the rejection, "That is the most utter madness," which is apparently directed against the whole manifest dream.

Critical readers have now the right to inquire about the origin of that interpolation, not formerly established, which refers to being made fun of by Gradiva. To this *Traumdeutung* gives the answer; if in dream-thoughts, taunts and sneers, or bitter contradictions occur, they are expressed by the nonsensical course of the manifest dream, through the absurdity in the dream. The latter means, therefore, no paralysis of psychic activity, but is one of the means of representation which the dream-work makes use of. As always in especially difficult passages, our author here comes to our assistance. The nonsensical dream has another postlude in which a bird utters a merry call and takes away the lizard in his beak. Such a laughing call Hanold had heard after Gradiva's disappearance. It really came from Zoë who was shaking off the melancholy seriousness of her lower world rôle; with this laugh Gradiva had really derided him. The dream-picture, however, of the bird carrying away the lizard may recall that other one in a former dream in which Apollo Belvedere carried away the Capitoline Venus.

Perhaps the impression now exists with many readers that the interpretation of the lizard-catching situation by the idea of wooing is not sufficiently justified. Additional support is found here, perhaps in the hint that Zoë, in conversation with her colleague, admits about herself that very thing which Hanold's thoughts suppose about her, when she tells that she had been sure of "digging up" something interesting for herself here in Pompeii. She thereby delves into the archæological series of associations as he did into the zoological with his allegory of lizard-catching, as if they were opposing each other and each wished to assume properties of the other.

Thus we have finished the interpretation of the second dream. Both have become accessible to our understanding under the presupposition that the dreamer, in his unconscious thought, knows all that he has forgotten in his conscious, has in the former rightly judged everything which, in the latter, he delusively misconstrues. In this connection we have, of course, been obliged to make many assertions which sounded odd to the reader because they were strange to him and probably often awakened the suspicion that we were giving out as our author's meaning what is only our own meaning. We are ready to do everything to dissipate this suspicion and will therefore gladly consider more exhaustively one of the most knotty points — I mean the use of ambiguous words and speeches as in the example, "Somewhere in the Sun Gradiva sat."

It must be striking to every reader of *Gradiva* how often our author puts into the mouths of both the leading characters speeches which have double meaning. For Hanold these speeches are intended to have only one meaning, and only his companion, Gradiva, is affected by their other meaning. Thus, after her first answer, he exclaims: "I knew that your voice sounded so," and the yet unenlightened Zoë has to ask how that is possible, as he has never before heard her speak. In the second conversation, the girl is for a moment puzzled by his delusion, as he assures her that he recognized her at once. She must understand these words in the meaning that is correct for his unconscious, as his recognition of their acquaintance which reaches back into childhood, while he, of course, knows nothing of this meaning of his speech and explains it only by reference to the delusion which dominates him. The speeches of the girl, on the other hand, in whose person the most brilliant mental clarity is opposed to the delusion, are made intentionally ambiguous. One meaning of them falls in with the ideas of Hanold's delusion, in order to enable her to penetrate into his conscious comprehension, the other raises itself above the delusion, and, as a rule, gives us the interpretation of it in the unconscious truth which has been represented by it. It is a triumph of wit to be able to represent the delusion and the truth in the same expression.

Interspersed with such ambiguities is Zoë's speech in which she explains the situation to her girl friend and at the same time rids herself of her disturbing society; it is really spoken out of the book, calculated more for us readers than for her happy colleague. In the conversations with Hanold, the double meaning is chiefly established by the fact that Zoë

makes use of the symbolism which we find followed in Hanold's first dream, in the equivalence of repression and destruction, Pompeii and childhood. Thus on the one hand she can, in her speeches, continue in the rôle which Hanold's delusion assigns to her, on the other, she can touch upon the real relations, and awaken in Hanold's unconscious a knowledge of them.

"I have long accustomed myself to being dead." (G. .) "For me, the flower of oblivion is the right one from your hand" (G.). In these speeches is given lightly the reproof which then breaks out clearly enough in her last sermon when she compares him to an archæopteryx. "That a person must die to become alive again; but for archæologists that is, of course, necessary" (G.), she continues after the solution of the delusion as if to give us the key to her ambiguous speeches. The most beautiful symbolism appears, however, in the question (G.): "It seems to me as if we had already eaten our bread thus together once two thousand years ago. Can't you remember it?" In this speech the substitution of historic antiquity for childhood, and the effort to awaken his memory of the latter are quite unmistakable.

Whence, therefore, comes this striking preference for ambiguous speeches in *Gradiva*? It seems to us not chance, but the necessary sequence from the preliminaries of the tale. It is nothing but the counterpart of the twofold determination of symptoms in so far as the speeches are themselves symptoms and proceed from compromises between the conscious and the unconscious; but one notices this double origin in the speeches more easily than in the acts; and when, as the pliability of the material of conversation often makes possible, each of the two intentions of a speech succeeds by the same arrangement of words in expressing itself well, then there is present what we call an "ambiguity."

During the psychotherapeutic treatment of a delusion, or an analogous disturbance, one often evolves such ambiguous speeches in patients as new symptoms of the most fleeting duration, and can even succeed in making use of them, whereby, with the meaning intended for the consciousness of the patient, one can, not infrequently, stimulate the understanding for the one valid in the unconscious. I know from experience that among the uninitiate this rôle of ambiguity usually gives the greatest offence, and causes the grossest misunderstanding, but our author was right, at any rate,

in representing in his production this characteristic feature of the processes of the formation of dream and delusion.

IV

With Zoë's entrance as physician there is awakened in us, we said, a new interest. We are eager to learn if such a cure as she accomplishes on Hanold is comprehensible or possible, whether our author has observed the conditions of the passing of a delusion as correctly as those of its development.

Without doubt a view will be advanced denying to the case portrayed by our author such a principal interest, and recognizing no problem requiring an explanation. For Hanold nothing more remains, it might be asserted, but to solve his delusion again, after its object, the supposed Gradiva, conveys to him the incorrectness of all his assertions and gives him the most natural explanations for everything puzzling; for example, how she knows his name. Thereby the affair would be settled logically; as, however, the girl in this case has confessed her love, for the satisfaction of his feminine readers, our author would surely allow the otherwise not uninteresting story to end in the usually happy way, marriage. More consistent, and just as possible, would have been the different conclusion that the young scholar, after the explanation of his mistake, should, with polite thanks, take his leave of the young lady and in that way motivate the rejection of her love so that he might offer an intense interest to ancient women of bronze or stone, or the originals of these, if they were attainable, but might have no idea of how to deal with a girl of flesh and blood of his own time. The archæological fancy was most arbitrarily cemented into a love-story by our author, himself.

In discountenancing this conception as impossible, our attention is first called to the fact that we have to attribute the change beginning in Norbert Hanold not to the relinquishment of the delusion alone. At the same time, indeed before the solution of the latter, there is in him an undeniable awakening of the desire for love, which, of course, results in his asking for the hand of the girl who has freed him from delusion. We have already shown under what pretexts and cloakings, curiosity about her corporeal nature, jealousy, and the brutal male impulse for possession are expressed in him in the midst of the delusion, since repressed desire put the first

dream into his mind. Let us add the further testimony that in the evening after the second talk with Gradiva a living woman for the first time seems congenial to him, although he still makes the concession to his abhorrence of honeymoon travellers, by not recognizing the congenial girl as newly married. The next forenoon, however, chance makes him witness of an exchange of caresses between the girl and her supposed brother, and he draws back shyly as if he had disturbed a holy ceremony. Disdain for "Augustus" and "Gretchen" is forgotten and respect for love is restored to him.

Thus our author has connected the treatment of the delusion and the breaking forth of the desire for love most closely with one another, and prepared the outcome in a love-affair as necessary. He knows the nature of the delusion even better than his critics; he knows that a component of amorous desire has combined with a component of resistance in the formation of the delusion, and he has the girl who undertakes the cure discover in Hanold's delusion the component referring to her. Only this insight can make her decide to devote herself to treating him, only the certainty of knowing herself loved by him can move her to confess to him her love. The treatment consists in restoring to him, from without, the repressed memories which he cannot release from within; it would be ineffective if the therapeutist did not consider the emotions; and the interpretation of the delusion would not finally be: "See; all that means only that you love me."

The procedure which our author has his Zoë follow for the cure of the delusion of the friend of her youth, shows a considerable resemblance, no, complete agreement, essentially, with a therapeutic method which Dr. J. Breuer and the present writer introduced into medicine in 1895, and to the perfection of which the latter has since devoted himself. This method of treatment, first called the "cathartic" by Breuer, which the present writer has preferred to designate as "analytic," consists in rather forcibly bringing into the consciousness of the patients who suffer from disturbances analogous to Hanold's delusion, the unconscious, through the repression of which they have become ill, just as Gradiva does with the repressed memories of their childhood relations. To be sure, accomplishment of this task is easier for Gradiva than for the physician; she is, in this connection, in a position which might be called ideal from many view-points. The physician who does not fathom his patient in

advance, and does not possess within himself, as conscious memory, what is working in the patient as unconscious, must call to his aid a complicated technique in order to overcome this disadvantage. He must learn to gather with absolute certainty, from the patient's conscious ideas and statements, the repressed material in him, to guess the unconscious, when it betrays itself behind the patient's conscious expressions and acts. The latter then does something similar to what Norbert Hanold did at the end of the story, when he re-translates the name, Gradiva, into *Bertgang*. The disturbance disappears then by being traced back to its origin; analysis brings cure at the same time.

The similarity between the procedure of Gradiva and the analytic method of psychotherapy is, however, not limited to these two points, making the repressed conscious, and the concurrence of explanation and cure. It extends itself to what proves the essential of the whole change, the awakening of the emotions. Every disturbance analogous to Hanold's delusion, which in science we usually designate as a psychoneurosis, has, as a preliminary, the repression of part of the emotional life, to speak boldly, of the sex-impulse, and at every attempt to introduce the unconscious and repressed cause of illness into consciousness, the emotional component necessarily awakens to renewed struggle with the forces repressing it, to adjust itself for final result, often under violent manifestations of reaction. In reawakening, in consciousness, of repressed love, the process of recuperation is accomplished when we sum up all the various components of sex-impulse as "love," and this reawakening is irremissible, for the symptoms on account of which the treatment was undertaken are nothing but the precipitations of former struggles of repression and recurrence and can be solved and washed away only by a new high-tide of these very passions. Every psychoanalytic treatment is an attempt to free repressed love, which has formed a miserable compromise-outlet in a symptom. Yes, the conformity with the therapeutic process pictured by the author in *Gradiva* reaches its height when we add that even in analytical psychotherapy the reawakened passion, whether love or hate, chooses the person of the physician as its object every time.

Then, of course, appear the differences which make the case of Gradiva an ideal one such as the technique of physicians cannot attain. Gradiva can respond to the love which is pushing through from the unconscious into the conscious; the physician cannot; Gradiva was herself the object of the

former repressed love; her person offers at once a desirable object to the freed erotic activity. The physician has been a stranger, and after the cure must try to become a stranger again; often he does not know how to advise the cured patient to apply in life her regained capacity for love. To suggest what resources and makeshifts the physician then employs to approach with more or less success the model of a love-cure which our author has drawn for us, would carry us too far away from our present task.

Now, however, the last question which we have already evaded answering several times. Our views about repression, the formation of delusion and related disturbances, the formation and interpretation of dreams, the rôle of erotic life, and the manner of cure for such disturbances are, of course, not by any means the common property of science, to say nothing of being the possession of educated people. If the insight which makes our author able to create his “Fancy” in such a way that we can analyse it like a real history of disease has for its foundation the above-mentioned knowledge, we should like to find out the source of it. One of the circle who, as was explained at the beginning, was interested in the dreams of *Gradiva* and their possible interpretation, put the direct question to Wilhelm Jensen, whether any such similar theories of science had been known to him. Our author answered, as was to be expected, in the negative, and rather testily. His imagination had put into his mind the *Gradiva* in whom he had his joy; any one whom she did not please might leave her alone. He did not suspect how much she had pleased the readers.

It is easily possible that our author’s rejection does not stop at that. Perhaps he denies knowledge of the rules which we have shown that he follows, and disavows all the intentions which we recognized in his production; I do not consider this improbable; then, however, only two possibilities remain. Either we have presented a true caricature of interpretation, by transferring to a harmless work of art tendencies of which its creator had no idea, and have thereby shown again how easy it is to find what one seeks and what one is engrossed with, a possibility of which most strange examples are recorded in the history of literature. Every reader may now decide for himself whether he cares to accept such an explanation; we, of course, hold fast to the other, still remaining view. We think that our author needed to know nothing of such rules and intentions, so that he may disavow them in good faith, and that we have surely found nothing in his romance which was not contained in it. We are

probably drawing from the same source, working over the same material, each of us with a different method, and agreement in results seems to vouch for the fact that both have worked correctly. Our procedure consists of the conscious observation of abnormal psychic processes in others, in order to be able to discover and express their laws. Our author proceeds in another way; he directs his attention to the unconscious in his own psyche, listens to its possibilities of development and grants them artistic expression, instead of suppressing them with conscious critique. Thus he learns from himself what we learn from others, what laws the activity of this unconscious must follow, but he does not need to express these laws, need not even recognize them clearly; they are, as a result of his intelligent patience, contained incarnate in his creatures. We unfold these laws by analysis of his fiction as we discover them from cases of real illness, but the conclusion seems irrefutable, that either both (our author, as well as the physician) have misunderstood the unconscious in the same way or we have both understood it correctly. This conclusion is very valuable for us; for its sake, it was worth while for us to investigate the representation of the formation and cure of delusion, as well as the dreams, in Jensen's *Gradiva* by the methods of therapeutic psychoanalysis.

We have reached the end. An observant reader might remind us that, at the beginning, we had remarked that dreams are wishes represented as fulfilled and that we still owe the proof of it. Well, we reply, our arguments might well show how unjustifiable it would be to wish to cover the explanations which we have to give of the dream with the formula that the dream is a wish-fulfilment; but the assertion stands, and is also easy to demonstrate for the dreams in *Gradiva*. The latent dream-thoughts — we know now what is meant by that — may be of numerous kinds; in *Gradiva* they are day-remnants, thoughts which are left over unheard, and not disposed of by the psychic activity of waking life. In order that a dream may originate from them the co-operation of a — generally unconscious — wish is required; this establishes the motive power for the dream-formation; the day-remnants give the material for it. In Norbert Hanold's first dream two wishes concur in producing the dream, one capable of consciousness, the other, of course, belonging to the unconscious, and active because of repression. This was the wish, comprehensible to every archæologist, to have been an eye-witness of that catastrophe of 79. What sacrifice would be too great, for an antiquarian, to realize this wish

otherwise than through dreams! The other wish and dream-maker is of an erotic nature: to be present when the beloved lies down to sleep, to express it crudely. It is the rejection of this which makes the dream an anxiety-dream. Less striking are, perhaps, the impelling wishes of the second dream, but if we recall its interpretation, we shall not hesitate to pronounce it also erotic. The wish to be captured by the beloved, to yield and surrender to her, as it may be construed behind the lizard-catching, has really a passive masochistic character. On the next day the dreamer strikes the beloved, as if under the sway of the antagonistic, erotic force; but we must stop or we may forget that Hanold and Gradiva are only creatures of our author.

THE END

FIVE LECTURES ON PSYCHO-ANALYSIS

Translated by A. A. Brill

First Lecture

LADIES [1] and Gentlemen: It is a new and somewhat embarrassing experience for me to appear as lecturer before students of the New World. I assume that I owe this honor to the association of my name with the theme of psychoanalysis, and consequently it is of psychoanalysis that I shall aim to speak. I shall attempt to give you in very brief form an historical survey of the origin and further development of this new method of research and cure.

Granted that it is a merit to have created psychoanalysis, it is not my merit. I was a student, busy with the passing of my last examinations, when another physician of Vienna, Dr. Joseph Breuer, [2] made the first application of this method to the case of an hysterical girl (1880–82). We must now examine the history of this case and its treatment, which can be found in detail in "Studien über Hysterie," later published by Dr. Breuer and myself. [3]

But first one word. I have noticed, with considerable satisfaction, that the majority of my hearers do not belong to the medical profession. Now do not fear that a medical education is necessary to follow what I shall have to say. We shall now accompany the doctors a little way, but soon we shall take leave of them and follow Dr. Breuer on a way which is quite his own.

Dr. Breuer's patient was a girl of twenty-one, of a high degree of intelligence. She had developed in the course of her two years' illness a series of physical and mental disturbances which well deserved to be taken seriously. She had a severe paralysis of both right extremities, with anasthesia, and at times the same affection of the members of the left side of the body; disturbance of eye-movements, and much impairment of vision; difficulty in maintaining the position of the head, an intense *Tussis nervosa*, nausea when she attempted to take nourishment, and at one time for several weeks a loss of the power to drink, in spite of tormenting thirst. Her power of speech was also diminished, and this progressed so far that she could neither speak nor understand her mother tongue; and, finally, she was subject to states of "absence," of confusion, delirium, alteration of her whole personality. These states will later claim our attention.

When one hears of such a case, one does not need to be a physician to incline to the opinion that we are concerned here with a serious injury, probably of the brain, for which there is little hope of cure and which will probably lead to the early death of the patient. The doctors will tell us, however, that in one type of cases with just as unfavorable symptoms, another, far more favorable, opinion is justified. When one finds such a series of symptoms in the case of a young girl, whose vital organs (heart, kidneys), are shown by objective tests to be normal, but who has suffered from strong emotional disturbances, and when the symptoms differ in certain finer characteristics from what one might logically expect, in a case like this the doctors are not too much disturbed. They consider that there is present no organic lesion of the brain, but that enigmatical state, known since the time of the Greek physicians as hysteria, which can simulate a whole series of symptoms of various diseases. They consider in such a case that the life of the patient is not in danger and that a restoration to health will probably come about of itself. The differentiation of such an hysteria from a severe organic lesion is not always very easy. But we do not need to know how a differential diagnosis of this kind is made; you may be sure that the case of Breuer's patient was such that no skillful physician could fail to diagnose an hysteria. We may also add a word here from the history of the case. The illness first appeared while the patient was caring for her father, whom she tenderly loved, during the severe illness which led to his death, a task which she was compelled to abandon because she herself fell ill.

So far it has seemed I best to go with the doctors, but we shall soon part company with them. You must not think that the outlook of a patient with regard to medical aid is essentially bettered when the diagnosis points to hysteria rather than to organic disease of the brain. Against the serious brain diseases medical skill is in most cases powerless, but also in the case of hysterical affections the doctor can do nothing. He must leave it to benign nature, when and how his hopeful prognosis will be realized. [4] Accordingly, with the recognition of the disease as hysteria, little is changed in the situation of the patient, but there is a great change in the attitude of the doctor. We can observe that he acts quite differently toward hystericals than toward patients suffering from organic diseases. He will not bring the same interest to the former as to the latter, since their

suffering is much less serious and yet seems to set up the claim to be valued just as seriously.

But there is another motive in this action. The physician, who through his studies has learned so much that is hidden from the laity, can realize in his thought the causes and alterations of the brain disorders in patients suffering from apoplexy or dementia, a representation which must be right up to a certain point, for by it he is enabled to understand the nature of each symptom. But before the details of hysterical symptoms, all his knowledge, his anatomical-physiological and pathological education, desert him. He cannot understand hysteria. He is in the same position before it as the layman. And that is not agreeable to any one, who is in the habit of setting such a high valuation upon his knowledge. Hystericals, accordingly, tend to lose his sympathy; he considers them persons who overstep the laws of his science, as the orthodox regard heretics; he ascribes to them all possible evils, blames them for exaggeration and intentional deceit, “simulation,” and be punishes them by withdrawing his interest.

Now Dr. Breuer did not deserve this reproach in this case; he gave his patient sympathy and interest, although at first be did not understand how to help her. Probably this was easier for him on account of those superior qualities of the patient’s mind and character, to which he bears witness in his account of the case.

His sympathetic observation soon found the means which made the first help possible. It had been noticed that the patient, in her states of “absence,” of psychic alteration, usually mumbled over several words to herself. These seemed to spring from associations with which her thoughts were busy. The doctor, who was able to get these words, put her in a sort of hypnosis and repeated them to her over and over, in order to bring up any associations that they might have. The patient yielded to his suggestion and reproduced for him those psychic creations which controlled her thoughts during her “absences,” and which betrayed themselves in these single spoken words. These were fancies, deeply sad, often poetically beautiful, day dreams, we might call them, which commonly took as their starting point the situation of a girl beside the sick-bed of her father. Whenever she had related a number of such fancies, she was, as it were, freed and restored to her normal mental life. This state of health would last for several hours, and then give place on the next day to a new

“absence,” which was removed in the same way by relating the newly-created fancies. It was impossible not to get the impression that the psychic alteration which was expressed in the “absence” was a consequence of the excitations originating from these intensely emotional fancy-images. The patient herself, who at this time of her illness strangely enough understood and spoke only English, gave this new kind of treatment the name “talking cure,” or jokingly designated it as “chimney sweeping.”

The doctor soon hit upon the fact that through such cleansing of the soul more could be accomplished than a temporary removal of the constantly recurring mental “clouds.” Symptoms of the disease would disappear when in hypnosis the patient could be made to remember the situation and the associative connections under which they first appeared, provided free vent was given to the emotions which they aroused. “There was in the summer a time of intense heat, and the patient had suffered very much from thirst; for, without any apparent reason, she had suddenly become unable to drink. She would take a glass of water in her hand, but as soon as it touched her lips she would push it away as though suffering from hydrophobia. Obviously for these few seconds she was in her absent state. She ate only fruit, melons and the like, in order to relieve this tormenting thirst. When this had been going on about six weeks, she was talking one day in hypnosis about her English governess, whom she disliked, and finally told, with every sign of disgust, how she had come into the room of the governess, and how that lady’s little dog, that she abhorred, had drunk out of a glass. Out of respect for the conventions the patient had remained silent. Now, after she had given energetic expression to her restrained anger, she asked for a drink, drank a large quantity of water without trouble, and woke from hypnosis with the glass at her lips. The symptom thereupon vanished permanently.” [5]

Permit me to dwell for a moment on this experience. No one had ever cured an hysterical symptom by such means before, or had come so near understanding its cause. This would be a pregnant discovery if the expectation could be confirmed that still other, perhaps the majority of symptoms, originated in this way and could be removed by the same method. Breuer spared no pains to convince himself of this and investigated the pathogenesis of the other more serious symptoms in a more orderly way. Such was indeed the case; almost all the symptoms

originated in exactly this way, as remnants, as precipitates, if you like, of affectively-toned experiences, which for that reason we later called “psychic traumata.” The nature of the symptoms became clear through their relation to the scene which caused them. They were, to use the technical term, “determined” (*determiniert*) by the scene whose memory traces they embodied, and so could no longer be described as arbitrary or enigmatical functions of the neurosis.

Only one variation from what might be expected must be mentioned. It was not always a single experience which occasioned the symptom, but usually several, perhaps many similar, repeated traumata co-operated in this effect. It was necessary to repeat the whole series of pathogenic memories in chronological sequence, and of course in reverse order, the last first and the first last. It was quite impossible to reach the first and often most essential trauma directly, without first clearing away those coming later.

You will of course want to hear me speak of other examples of the causation of hysterical symptoms beside this of inability to drink on account of the disgust caused by the dog drinking from the glass. I must, however, if I hold to my programme, limit myself to very few examples. Breuer relates, for instance, that his patient’s visual disturbances could be traced back to external causes, in the following way. “The patient, with tears in her eyes, was sitting by the sick-bed when her father suddenly asked her what time it was. She could not see distinctly, strained her eyes to see, brought the watch near her eyes so that the dial seemed very large (macropia and strabismus conv.), or else she tried hard to suppress her tears, so that the sick man might not see them.” [6]

All the pathogenic impressions sprang from the time when she shared in the care of her sick father. “Once she was watching at night in the greatest anxiety for the patient, who was in a high fever, and in suspense, for a surgeon was expected from Vienna, to operate on the patient. Her mother had gone out for a little while, and Anna sat by the sick-bed, her right arm hanging over the back of her chair. She fell into a revery and saw a black snake emerge, as it were, from the wall and approach the sick man as though to bite him. (It is very probable that several snakes had actually been seen in the meadow behind the house, that she had already been frightened by them, and that these former experiences furnished the material for the hallucination.) She tried to drive off the creature, but was

as though paralyzed. Her right arm, which was hanging over the back of the chair, had “gone to sleep,” become anasthetic and paretic, and as she was looking at it, the fingers changed into little snakes with deaths-heads. (The nails.) Probably she attempted to drive away the snake with her paralyzed right hand, and so the anasthesia and paralysis of this member formed associations with the snake hallucination. When this had vanished, she tried in her anguish to speak, but could not. She could not express herself in any language, until finally she thought of the words of an English nursery song, and thereafter she could think and speak only in this language.” [7] When the memory of this scene was revived in hypnosis the paralysis of the right arm, which had existed since the beginning of the illness, was cured and the treatment ended.

When, a number of years later, I began to use Breuer’s researches and treatment on my own patients, my experiences completely coincided with his. In the case of a woman of about forty, there was a tic, a peculiar smacking noise which manifested itself whenever she was laboring under any excitement, without any obvious cause. It had its origin in two experiences which had this common element, that she attempted to make no noise, but that by a sort of counter-will this noise broke the stillness. On the first occasion, she had finally after much trouble put her sick child to sleep, and she tried to be very quiet so as not to awaken it. On the second occasion, during a ride with both her children in a thunderstorm the horses took fright, and she carefully avoided any noise for fear of frightening them still more. [8] I give this example instead of many others which are cited in the “Studien über Hysterie.”

Ladies and gentlemen, if you will permit me to generalize, as is indispensable in so brief a presentation, we may express our results up to this point in the formula: *Our hysterical patients suffer from reminiscences.* Their symptoms are the remnants and the memory symbols of certain (traumatic) experiences.

A comparison with other memory symbols from other sources will perhaps enable us better to understand this symbolism. The memorials and monuments with which we adorn our great cities, are also such memory symbols. If you walk through London you will find before one of the greatest railway stations of the city a richly decorated Gothic pillar—“Charing Cross.” One of the old Plantagenet kings, in the thirteenth century, caused the body of his beloved queen Eleanor to be borne to

Westminster, and had Gothic crosses erected at each of the stations where the coffin was set down. Charing Cross is the last of these monuments, which preserve the memory of this sad journey. [9] In another part of the city, you will see a high pillar of more modern construction, which is merely called “the monument.” This is in memory of the great fire which broke out in the neighborhood in the year 1666, and destroyed a great part of the city. These monuments are memory symbols like the hysterical symptoms; so far the comparison seems justified. But what would you say to a Londoner who to-day stood sadly before the monument to the funeral of Queen Eleanor, instead of going about his business with the haste engendered by modern industrial conditions, or rejoicing with the young queen of his own heart? Or to another, who before the “Monument” bemoaned the burning of his loved native city, which long since has arisen again so much more splendid than before?

Now hystericals and all neurotics behave like these two unpractical Londoners, not only in that they remember the painful experiences of the distant past, but because they are still strongly affected by them. They cannot escape from the past and neglect present reality in its favor. This fixation of the mental life on the pathogenic traumata is an essential, and practically a most significant characteristic of the neurosis. I will willingly concede the objection which you are probably formulating, as you think over the history of Breuer’s patient. All her traumata originated at the time when she was caring for her sick father, and her symptoms could only be regarded as memory symbols of his sickness and death. They corresponded to mourning, and a fixation on thoughts of the dead so short a time after death is certainly not pathological, but rather corresponds to normal emotional behavior. I concede this: there is nothing abnormal in the fixation of feeling on the trauma shown by Breuer’s patient. But in other cases, like that of the tic that I have mentioned, the occasions for which lay ten and fifteen years back, the characteristic of this abnormal clinging to the past is very clear, and Breuer’s patient would probably have developed it, if she had not come under the “cathartic treatment” such a short time after the traumatic experiences and the beginning of the disease.

We have so far only explained the relation of the hysterical symptoms to the life history of the patient; now by considering two further moments which Breuer observed, we may get a hint as to the processes of the

beginning of the illness and those of the cure. With regard to the first, it is especially to be noted that Breuer's patient in almost all pathogenic situations had to suppress a strong excitement, instead of giving vent to it by appropriate words and deeds. In the little experience with her governess' dog, she suppressed, through regard for the conventions, all manifestations of her very intense disgust. While she was seated by her father's sick bed, she was careful to betray nothing of her anxiety and her painful depression to the patient. When, later, she reproduced the same scene before the physician, the emotion which she had suppressed on the occurrence of the scene burst out with especial strength, as though it had been pent up all along. The symptom which had been caused by that scene reached its greatest intensity while the doctor was striving to revive the memory of the scene, and vanished after it had been fully laid bare. On the other hand, experience shows that if the patient is reproducing the traumatic scene to the physician, the process has no curative effect if, by some peculiar chance, there is no development of emotion. It is apparently these emotional processes upon which the illness of the patient and the restoration to health are dependent. We feel justified in regarding "emotion" as a quantity which may become increased, derived and displaced. So we are forced to the conclusion that the patient fell ill because the emotion developed in the pathogenic situation was prevented from escaping normally, and that the essence of the sickness lies in the fact that these "imprisoned" (*dingeklemmt*) emotions undergo a series of abnormal changes. In part they are preserved as a lasting charge and as a source of constant disturbance in psychical life; in part they undergo a change into unusual bodily innervations and inhibitions, which present themselves as the physical symptoms of the case. We have coined the name "hysterical conversion" for the latter process. Part of our mental energy is, under normal conditions, conducted off by way of physical innervation and gives what we call "the expression of emotions." Hysterical conversion exaggerates this part of the course of a mental process which is emotionally colored; it corresponds to a far more intense emotional expression, which finds outlet by new paths. If a stream flows in two channels, an overflow of one will take place as soon as the current in the other meets with an obstacle.

You see that we are in a fair way to arrive at a purely psychological theory of hysteria, in which we assign the first rank to the affective

processes. A second observation of Breuer compels us to ascribe to the altered condition of consciousness a great part in determining the characteristics of the disease. His patient showed many sorts of mental states, conditions of "absence," confusion and alteration of character, besides her normal state. In her normal state she was entirely ignorant of the pathogenic scenes and of their connection with her symptoms. She had forgotten those scenes, or at any rate had dissociated them from their pathogenic connection. When the patient was hypnotized, it was possible, after considerable difficulty, to recall those scenes to her memory, and by this means of recall the symptoms were removed. It would have been extremely perplexing to know how to interpret this fact, if hypnotic practice and experiments had not pointed out the way. Through the study of hypnotic phenomena, the conception, strange though it was at first, has become familiar, that in one and the same individual several mental groupings are possible, which may remain relatively independent of each other, "know nothing" of each other, and which may cause a splitting of consciousness along lines which they lay down. Cases of such a sort, known as "double personality" (*"double conscience"*), occasionally appear spontaneously. If in such a division of personality consciousness remains constantly bound up with one of the two states, this is called the *conscious* mental state, and the other the *unconscious.* In the well-known phenomena of so-called post hypnotic suggestion, in which a command given in hypnosis is later executed in the normal state as though by an imperative suggestion, we have an excellent basis for understanding how the unconscious state can influence the conscious, although the latter is ignorant of the existence of the former. In the same way it is quite possible to explain the facts in hysterical cases. Breuer came to the conclusion that the hysterical symptoms originated in such peculiar mental states, which he called "hypnoidal states." (*hypnoide Zustände.*) Experiences of an emotional nature, which occur during such hypnoidal states easily become pathogenic, since such states do not present the conditions for a normal draining off of the emotion of the exciting processes. And as a result there arises a peculiar product of this exciting process, that is, the symptom, and this is projected like a foreign body into the normal state. The latter has, then, no conception of the significance of the hypnoidal pathogenic situation. Where a symptom arises, we also find an amnesia, a memory

gap, and the filling of this gap includes the removal of the conditions under which the symptom originated.

I am afraid that this portion of my treatment will not seem very clear, but you must remember that we are dealing here with new and difficult views, which perhaps could not be made much clearer. This all goes to show that our knowledge in this field is not yet very far advanced. Breuer's idea of the hypnoidal states has, moreover, been shown to be superfluous and a hindrance to further investigation, and has been dropped from present conceptions of psychoanalysis. Later I shall at least suggest what other influences and processes have been disclosed besides that of the hypnoidal states, to which Breuer limited the causal moment.

You have probably also felt, and rightly, that Breuer's investigations gave you only a very incomplete theory and insufficient explanation of the phenomena which we have observed. But complete theories do not fall from Heaven, and you would have had still greater reason to be distrustful, had any one offered you at the beginning of his observations a well-rounded theory, without any gaps; such a theory could only be the child of his speculations and not the fruit of an unprejudiced investigation of the facts.

ENDNOTES.

[1] Lectures delivered at the Celebration of the Twentieth Anniversary of the opening of Clark University, Sept., 1909; translated from the German by Harry W. Chase, Fellow in Psychology, Clark University, and revised by Prof. Freud.

[2] Dr. Joseph Breuer, born 1842, corresponding member of the "Kaiserliche Akademie der Wissenschaften," is known by works on respiration and the physiology of the sense of equilibrium.

[3] "Studien über Hysterie," 1895, Deuticke, Vienna. Second edition, 1909. Parts of my contributions to this book have been translated into English by Dr. A. A. Brill, of New York. ("Selected Papers on Hysteria and other Psychoneuroses," by S. Freud.")

[4] I know that this view no longer holds to-day, but in the lecture I take myself and my hearers back to the time before 1880. If things have become different since that time it has been largely due to the work the history of which I am sketching.

[8] *Loc cit.*, 2d ed. pp. 43–46. A selection from this book, augmented by several later treatises on hysteria, lies before me, in an English translation by Dr. A. A. Brill, of New York. It bears the title “Selected Papers on Hysteria and other Psychoneuroses,” 1909. [No. 4 of the Nervous and Mental Disease Monograph Series, New York.]

[9] Or rather the later copy of such a monument. The name “Charing” is itself, as Dr. E. Jones tells me, derived from the words *“chère reine.”*

Second Lecture

LADIES and Gentlemen: At about the same time that Breuer was using the "talking-cure" with his patient, M. Charcot began in Paris, with the hystericals of the Salpetrière, those researches which were to lead to a new understanding of the disease. These results were, however, not yet known in Vienna. But when about ten years later Breuer and I published our preliminary communication on the psychic mechanism of hysterical phenomena, which grew out of the cathartic treatment of Breuer's first patient, we were both of us under the spell of Charcot's investigations. We made the pathogenic experiences of our patients, which acted as psychic traumata, equivalent to those physical traumata whose influence on hysterical paralyses Charcot had determined; and Breuer's hypothesis of hypnoidal states is itself only an echo of the fact that Charcot had artificially reproduced those traumatic paralyses in hypnosis.

The great French observer, whose student I was during the years 1885–86, had no natural bent for creating psychological theories. His student, P. Janet, was the first to attempt to penetrate more deeply into the psychic processes of hysteria, and we followed his example, when we made the mental splitting and the dissociation of personality the central points of our theory. Janet propounds a theory of hysteria which draws upon the principal theories of heredity and degeneration which are current in France. According to his view hysteria is a form of degenerative alteration of the nervous system, manifesting itself in a congenital "weakness" of the function of psychic synthesis. The hysterical patient is from the start incapable of correlating and unifying the manifold of his mental processes, and so there arises the tendency to mental dissociation. If you will permit me to use a banal but clear illustration, Janet's hysterical reminds one of a weak woman who has been shopping, and is now on her way home, laden with packages and bundles of every description. She cannot manage the whole lot with her two arms and her ten fingers, and soon she drops one. When she stoops to pick this up, another breaks loose, and so it goes on.

Now it does not agree very well with this assumed mental weakness of hystericals, that there can be observed in hysterical cases, besides the phenomena of lessened functioning, examples of a partial increase of functional capacity, as a sort of compensation. At the time when Breuer's

patient had forgotten her mother-tongue and all other languages save English, her control of English attained such a level that if a German book was put before her she could give a fluent, perfect translation of its contents at sight. When later I undertook to continue on my own account the investigations begun by Breuer, I soon came to another view of the origin of hysterical dissociation (or splitting of consciousness). It was inevitable that my views should diverge widely and radically, for my point of departure was not, like that of Janet, laboratory researches, but attempts at therapy. Above everything else, it was practical needs that urged me on. The cathartic treatment, as Breuer had made use of it, presupposed that the patient should be put in deep hypnosis, for only in hypnosis was available the knowledge of his pathogenic associations, which were unknown to him in his normal state. Now hypnosis, as a fanciful, and so to speak, mystical, aid, I soon came to dislike; and when I discovered that, in spite of all my efforts, I could not hypnotize by any means all of my patients, I resolved to give up hypnotism and to make the cathartic method independent of it.

Since I could not alter the psychic state of most of my patients at my wish, I directed my efforts to working with them in their normal state. This seems at first sight to be a particularly senseless and aimless undertaking. The problem was this: to find out something from the patient that the doctor did not know and the patient himself did not know. How could one hope to make such a method succeed? The memory of a very noteworthy and instructive proceeding came to my aid, which I had seen in Bernheim’s clinic at Nancy. Bernheim showed us that persons put in a condition of hypnotic somnambulism, and subjected to all sorts of experiences, had only apparently lost the memory of those somnambulic experiences, and that their memory of them could be awakened even in the normal state. If he asked them about their experiences during somnambulism, they said at first that they did not remember, but if he persisted, urged, assured them that they did know, then every time the forgotten memory came back.

Accordingly I did this with my patients. When I had reached in my procedure with them a point at which they declared that they knew nothing more, I would assure them that they did know, that they must just tell it out, and I would venture the assertion that the memory which would emerge at the moment that I laid my hand on the patient’s forehead would be the right one. In this way I succeeded, without hypnosis, in learning

from the patient all that was necessary for a construction of the connection between the forgotten pathogenic scenes and the symptoms which they had left behind. This was a troublesome and in its length an exhausting proceeding, and did not lend itself to a finished technique. But I did not give it up without drawing definite conclusions from the data which I had gained. I had substantiated the fact that the forgotten memories were not lost. They were in the possession of the patient, ready to emerge and form associations with his other mental content, but hindered from becoming conscious, and forced to remain in the unconscious by some sort of a force. The existence of this force could be assumed with certainty, for in attempting to drag up the unconscious memories into the consciousness of the patient, in opposition to this force, one got the sensation of his own personal effort striving to overcome it. One could get an idea of this force, which maintained the pathological situation, from the resistance of the patient.

It is on this idea of *resistance* that I based my theory of the psychic processes of hystericals. It had been found that in order to cure the patient it was necessary that this force should be overcome. Now with the mechanism of the cure as a starting point, quite a definite theory could be constructed. These same forces, which in the present situation as resistances opposed the emergence of the forgotten ideas into consciousness, must themselves have caused the forgetting, and repressed from consciousness the pathogenic experiences. I called this hypothetical process “repression” (*Verdrängung*), and considered that it was proved by the undeniable existence of resistance.

But now the question arose: what were those forces, and what were the conditions of this repression, in which we were now able to recognize the pathogenic mechanism of hysteria? A comparative study of the pathogenic situations, which the cathartic treatment has made possible, allows us to answer this question. In all those experiences, it had happened that a wish had been aroused, which was in sharp opposition to the other desires of the individual, and was not capable of being reconciled with the ethical, æsthetic and personal pretensions of the patient’s personality. There had been a short conflict, and the end of this inner struggle was the repression of the idea which presented itself to consciousness as the bearer of this irreconcilable wish. This was, then, repressed from consciousness and forgotten. The incompatibility of the idea in question with the “ego” of the

patient was the motive of the repression, the ethical and other pretensions of the individual were the repressing forces. The presence of the incompatible wish, or the duration of the conflict, had given rise to a high degree of mental pain; this pain was avoided by the repression. This latter process is evidently in such a case a device for the protection of the personality.

I will not multiply examples, but will give you the history of a single one of my cases, in which the conditions and the utility of the repression process stand out clearly enough. Of course for my purpose I must abridge the history of the case and omit many valuable theoretical considerations. It is that of a young girl, who was deeply attached to her father, who had died a short time before, and in whose care she had shared — a situation analogous to that of Breuer's patient. When her older sister married, the girl grew to feel a peculiar sympathy for her new brother-in-law, which easily passed with her for family tenderness. This sister soon fell ill and died, while the patient and her mother were away. The absent ones were hastily recalled, without being told fully of the painful situation. As the girl stood by the bedside of her dead sister, for one short moment there surged up in her mind an idea, which might be framed in these words: "Now he is free and can marry me." We may be sure that this idea, which betrayed to her consciousness her intense love for her brother-in-law, of which she had not been conscious, was the next moment consigned to repression by her revolted feelings. The girl fell ill with severe hysterical symptoms, and, when I came to treat the case, it appeared that she had entirely forgotten that scene at her sister's bedside and the unnatural, egoistic desire which had arisen in her. She remembered it during the treatment, reproduced the pathogenic moment with every sign of intense emotional excitement, and was cured by this treatment. [1]

Perhaps I can make the process of repression and its necessary relation to the resistance of the patient, more concrete by a rough illustration, which I will derive from our present situation.

Suppose that here in this hall and in this audience, whose exemplary stillness and attention I cannot sufficiently commend, there is an individual who is creating a disturbance, and, by his ill-bred laughing, talking, by scraping his feet, distracts my attention from my task. I explain that I cannot go on with my lecture under these conditions, and thereupon several strong men among you get up, and, after a short struggle, eject the

disturber of the peace from the hall. He is now “repressed,” and I can continue my lecture. But in order that the disturbance may not be repeated, in case the man who has just been thrown out attempts to force his way back into the room, the gentlemen who have executed my suggestion take their chairs to the door and establish themselves there as a “resistance,” to keep up the repression. Now, if you transfer both locations to the psyche, calling this “consciousness,” and the outside the “unconscious,” you have a tolerably good illustration of the process of repression.

We can see now the difference between our theory and that of Janet. We do not derive the psychic fission from a congenital lack of capacity on the part of the mental apparatus to synthesize its experiences, but we explain it dynamically by the conflict of opposing mental forces, we recognize in it the result of an active striving of each mental complex against the other.

New questions at once arise in great number from our theory. The situation of psychic conflict is a very frequent one; an attempt of the ego to defend itself from painful memories can be observed everywhere, and yet the result is not a mental fission. We cannot avoid the assumption that still other conditions are necessary, if the conflict is to result in dissociation. I willingly concede that with the assumption of “repression” we stand, not at the end, but at the very beginning of a psychological theory. But we can advance only one step at a time, and the completion of our knowledge must await further and more thorough work.

Now do not attempt to bring the case of Breuer’s patient under the point of view of repression. This history cannot be subjected to such an attempt, for it was gained with the help of hypnotic influence. Only when hypnosis is excluded can you see the resistances and repressions and get a correct idea of the pathogenic process. Hypnosis conceals the resistances and so makes a certain part of the mental field freely accessible. By this same process the resistances on the borders of this field are heaped up into a rampart, which makes all beyond inaccessible.

The most valuable things that we have learned from Breuer’s observations were his conclusions as to the connection of the symptoms with the pathogenic experiences or psychic traumata, and we must not neglect to evaluate this result properly from the standpoint of the repression-theory. It is not at first evident how we can get from the repression to the creation of the symptoms. Instead of giving a

complicated theoretical derivation, I will return at this point to the illustration which I used to typify repression.

Remember that with the ejection of the rowdy and the establishment of the watchers before the door, the affair is not necessarily ended. It may very well happen that the ejected man, now embittered and quite careless of consequences, gives us more to do. He is no longer among us, we are free from his presence, his scornful laugh, his half-audible remarks, but in a certain sense the repression has miscarried, for he makes a terrible uproar outside, and by his outcries and by hammering on the door with his fists interferes with my lecture more than before. Under these circumstances it would be hailed with delight if possibly our honored president, Dr. Stanley Hall, should take upon himself the rôle of peacemaker and mediator. He would speak with the rowdy on the outside, and then turn to us with the recommendation that we let him in again, provided he would guarantee to behave himself better. On Dr. Hall's authority we decide to stop the repression, and now quiet and peace reign again. This is in fact a fairly good presentation of the task devolving upon the physician in the psychoanalytic therapy of neuroses. To say the same thing more directly: we come to the conclusion, from working with hysterical patients and other neurotics, that they have not fully succeeded in repressing the idea to which the incompatible wish is attached. They have, indeed, driven it out of consciousness and out of memory, and apparently saved themselves a great amount of psychic pain, *but in the unconscious the suppressed wish still exists*, only waiting for its chance to become active, and finally succeeds in sending into consciousness, instead of the repressed idea, a disguised and unrecognizable surrogate-creation (*Ersatzbildung*), to which the same painful sensations associate themselves that the patient thought he was rid of through his repression. This surrogate of the suppressed idea — the symptom — is secure against further attacks from the defences of the ego, and instead of a short conflict there originates now a permanent suffering. We can observe in the symptom, besides the tokens of its disguise, a remnant of traceable similarity with the originally repressed idea; the way in which the surrogate is built up can be discovered during the psychoanalytic treatment of the patient, and for his cure the symptom must be traced back over the same route to the repressed idea. If this repressed material is once more made part of the conscious mental functions — a process which

supposes the overcoming of considerable resistance — the psychic conflict which then arises, the same which the patient wished to avoid, is made capable of a happier termination, under the guidance of the physician, than is offered by repression. There are several possible suitable decisions which can bring conflict and neurosis to a happy end; in particular cases the attempt may be made to combine several of these. Either the personality of the patient may be convinced that he has been wrong in rejecting the pathogenic wish, and he may be made to accept it either wholly or in part; or this wish may itself be directed to a higher goal which is free from objection, by what is called sublimation (*Sublimierung*); or the rejection may be recognized as rightly motivated, and the automatic and therefore insufficient mechanism of repression be reinforced by the higher, more characteristically human mental faculties: one succeeds in mastering his wishes by conscious thought.

Forgive me if I have not been able to present more clearly these main points of the treatment which is to-day known as “psychoanalysis.” The difficulties do not lie merely in the newness of the subject.

Regarding the nature of the unacceptable wishes, which succeed in making their influence felt out of the unconscious, in spite of repression; and regarding the question of what subjective and constitutional factors must be present for such a failure of repression and such a surrogate or symptom creation to take place, we will speak in later remarks.

ENDNOTES.

[1] This case has been translated by Dr. Brill in “Selected papers on hysteria,” etc., p. 31 — F 4.

Third Lecture

LADIES and Gentlemen: It is not always easy to tell the truth, especially when one must be brief, and so to-day I must correct an incorrect statement that I made in my last lecture.

I told you how when I gave up using hypnosis I pressed my patients to tell me what came into their minds that had to do with the problem we were working on, I told them that they would remember what they had apparently forgotten, and that the thought which irrupted into consciousness (*Einfall*) would surely embody the memory for which we were seeking. I claimed that I substantiated the fact that the first idea of my patients brought the right clue and could be shown to be the forgotten continuation of the memory. Now this is not always so; I represented it as being so simple only for purposes of abbreviation. In fact, it would only happen the first times that the right forgotten material would emerge through simple pressure on my part. If the experience was continued, ideas emerged in every case which could not be the right ones, for they were not to the purpose, and the patients themselves rejected them as incorrect. Pressure was of no further service here, and one could only regret again having given up hypnosis. In this state of perplexity I clung to a prejudice which years later was proved by my friend C. G. Jung of the University of Zürich, and his pupils to have a scientific justification. I must confess that it is often of great advantage to have prejudices. I put a high value on the strength of the determination of mental processes, and I could not believe that any idea which occurred to the patient, which originated in a state of concentrated attention, could be quite arbitrary and out of all relation to the forgotten idea that we were seeking. That it was not identical with the latter, could be satisfactorily explained by the hypothetical psychological situation. In the patients whom I treated there were two opposing forces: on the one hand the conscious striving to drag up into consciousness the forgotten experience which was present in the unconscious; and on the other hand the resistance which we have seen, which set itself against the emergence of the suppressed idea or its associates into consciousness. In case this resistance was nonexistent or very slight, the forgotten material could become conscious without disguise (*Enstellung*). It was then a natural supposition that the disguise would be the more complete, the greater the resistance to the emergence of the idea. Thoughts which broke

into the patient's consciousness instead of the ideas sought for, were accordingly made up just like symptoms; they were new, artificial, ephemeral surrogates for the repressed ideas, and differed from these just in proportion as they had been more completely disguised under the influence of the resistances. These surrogates must, however, show a certain similarity with the ideas which are the object of our search, by virtue of their nature as symptoms; and when the resistance is not too intensive it is possible from the nature of these irruptions to discover the hidden object of our search. This must be related to the repressed thought as a sort of allusion, as a statement of the same thing in *indirect* terms.

We know cases in normal psychology in which analogous situations to the one which we have assumed give rise to similar experiences. Such a case is that of wit. By my study of psychoanalytic technique I was necessarily led to a consideration of the problem of the nature of wit. I will give one example of this sort, which, too, is a story that originally appeared in English.

The anecdote runs: [1] Two unscrupulous business men had succeeded by fortunate speculations in accumulating a large fortune, and then directed their efforts to breaking into good society. Among other means they thought it would be of advantage to be painted by the most famous and expensive artist of the city, a man whose paintings were considered as events. The costly paintings were first shown at a great soirée and both hosts led the most influential connoisseur and art critic to the wall of the salon on which the portraits were hung, to elicit his admiring judgment. The artist looked for a long time, looked about as though in search of something, and then merely asked, pointing out the vacant space between the two pictures; "And where is the Saviour?"

I see that you are all laughing over this good example of wit, which we will now attempt to analyse. We understand that the critic means to say; "You are a couple of malefactors, like those between whom the Saviour was crucified." But he does not say this, he expresses himself instead in a way that at first seems not to the purpose and not related to the matter in hand, but which at the next moment we recognize as an *allusion* to the insult at which he aims, and as a perfect surrogate for it. We cannot expect to find in the case of wit all those relations that our theory supposes for the origin of the irruptive ideas of our patients, but it is my desire to lay stress

on the similar motivation of wit and irruptive idea. Why does not the critic say directly what he has to say to the two rogues? Because, in addition to his desire to say it straight out, he is actuated by strong opposite motives. It is a proceeding which is liable to be dangerous to offend people who are one's hosts, and who can call to their aid the strong arms of numerous servants. One might easily suffer the same fate that I used in the previous lecture to illustrate repression. On this ground, the critic does not express the particular insult directly, but in a disguised form, as an allusion with omission. The same constellation comes into play, according to our hypothesis, when our patient produces the irruptive idea as a surrogate for the forgotten idea which is the object of the quest.

Ladies and gentlemen, it is very useful to designate a group of ideas which belong together and have a common emotive tone, according to the custom of the Zürich school (Bleuler, Jung and others), as a "complex." So we can say that if we set out from the last memories of the patient to look for a repressed complex, that we have every prospect of discovering it, if only the patient will communicate to us a sufficient number of the ideas which come into his head. So we let the patient speak along any line that he desires, and cling to the hypothesis that nothing can occur to him except what has some indirect bearing on the complex that we are seeking. If this method of discovering the repressed complexes seems too circumstantial, I can at least assure you that it is the only available one.

In practicing this technique, one is further bothered by the fact that the patient often stops, is at a stand-still, and considers that he has nothing to say; nothing occurs to him. If this were really the case and the patient were right, our procedure would again be proven inapplicable. Closer observation shows that such an absence of ideas never really occurs, and that it only appears to when the patient holds back or rejects the idea which be perceives, under the influence of the resistance, which disguises itself as critical judgment of the value of the idea. The patient can be protected from this if he is warned in advance of this circumstance, and told to take no account of the critical attitude. He must say anything that comes into his mind, fully laying aside such critical choice, even though he may think it unessential, irrelevant, nonsensical, especially when the idea is one which is unpleasant to dwell on. By following this prescription we secure the material which sets us on the track of the repressed complex.

These irruptive ideas, which the patient himself values little, if he is under the influence of the resistance and not that of the physician, are for the psychologist like the ore, which by simple methods of interpretation he reduces from its crude state to valuable metal. If one desires to gain in a short time a preliminary knowledge of the patient's repressed complexes, without going into the question of their arrangement and associations, this examination may be conducted with the help of the association experiments, as Jung [2] and his pupils have perfected them. This procedure is to the psychologist what qualitative analysis is to the chemist; it may be dispensed with in the therapy of neurotic patients, but is indispensable in the investigations of the psychoses, which have been begun by the Zürich school with such valuable results.

This method of work with whatever comes into the patient's head when be submits to psychoanalytic treatment, is not the only technical means at our disposal for the widening of consciousness. Two other methods of procedure serve the same purpose, the interpretation of his dreams and the evaluation of acts which he bungles or does without intending to (*Fehl- und Zufallshandlungen*).

I might say, esteemed hearers, that for a long time I hesitated whether instead of this hurried survey of the whole field of psychoanalysis, I should not rather offer you a thorough consideration of the analysis of dreams; a purely subjective and apparently secondary motive decided me against this. It seemed rather an impropriety that in this country, so devoted to practical pursuits, I should pose as "interpreter of dreams," before you had a chance to discover what significance the old and despised art can claim.

Interpretation of dreams is in fact the *via regia* to the interpretation of the unconscious, the surest ground of psychoanalysis and a field in which every worker must win his convictions and gain his education. If I were asked how one could become a psychoanalyst, I should answer, through the study of his own dreams. With great tact all opponents of the psychoanalytic theory have so far either evaded any criticism of the *"Traumdeutung"* [3] or have attempted to pass over it with the most superficial objections. If, on the contrary, you will undertake the solution of the problems of dream life, the novelties which psychoanalysis present to your thoughts will no longer be difficulties.

You must remember that our nightly dream productions show the greatest outer similarity and inner relationship to the creations of the insane, but on the other hand are compatible with full health during waking life. It does not sound at all absurd to say that whoever regards these normal sense illusions, these delusions and alterations of character as matter for amazement instead of understanding, has not the least prospect of understanding the abnormal creations of diseased mental states in any other than the lay sense. You may with confidence place in this lay group all the psychiatrists of today. Follow me now on a brief excursion through the field of dream problems.

In our waking state we usually treat dreams with as little consideration as the patient treats the irruptive ideas which the psychoanalyst demands from him. It is evident that we reject them, for we forget them quickly and completely. The slight valuation which we place on them is based, with those dreams that are not confused and nonsensical, on the feeling that they are foreign to our personality, and, with other dreams, on their evident absurdity and senselessness. Our rejection derives support from the unrestrained shamelessness and the immoral longings which are obvious in many dreams. Antiquity, as we know, did not share this light valuation of dreams. The lower classes of our people to-day stick close to the value which they set on dreams; they, however, expect from them, as did the ancients, the revelation of the future. I confess that I see no need to adopt mystical hypotheses to fill out the gaps in our present knowledge, and so I have never been able to find anything that supported the hypothesis of the prophetic nature of dreams. Many other things, which are wonderful enough, can be said about them.

And first, not all dreams are so foreign to the character of the dreamer, are incomprehensible and confused. If you will undertake to consider the dreams of young children from the age of a year and a half on, you will find them quite simple and easy to interpret. The young child always dreams of the fulfillment of wishes which were aroused in him the day before and were not satisfied. You need no art of interpretation to discover this simple solution, you only need to inquire into the experiences of the child on the day before (the “dream day”). Now it would certainly be a most satisfactory solution of the dream-riddle, if the dreams of adults, too, were the same as those of children, fulfillments of wishes which had been aroused in them during the dream day. This is actually the fact; the

difficulties which stand in the way of this solution can be removed step by step by a thorough analysis of the dream.

There is, first of all, the most weighty objection, that the dreams of adults generally have an incomprehensible content, which shows wish-fulfillment least of anything. The answer is this: these dreams have undergone a process of disguise, the psychic content which underlies them was originally meant for quite different verbal expression. You must differentiate between the *manifest dream-content*, which we remember in the morning only confusedly, and with difficulty clothe in words which seem arbitrary, and the *latent dream-thoughts*, whose presence in the unconscious we must assume. This distortion of the dream (*Traumentstellung*) is the same process which has been revealed to you in the investigations of the creations (*symptoms*) of hysterical subjects; it points to the fact that the same opposition of psychic forces has its share in the creation of dreams as in the creation of symptoms.

The manifest dream-content is the disguised surrogate for the unconscious dream thoughts, and this disguising is the work of the defensive forces of the ego, of the resistances. These prevent the repressed wishes from entering consciousness during the waking life, and even in the relaxation of sleep they are still strong enough to force them to hide themselves by a sort of masquerading. The dreamer, then, knows just as little the sense of his dream as the hysterical knows the relation and significance of his symptoms. That there are latent dream-thoughts and that between them and the manifest dream-content there exists the relation just described — of this you may convince yourselves by the analysis of dreams, a procedure the technique of which is exactly that of psychoanalysis. You must abstract entirely from the apparent connection of the elements in the manifest dream and seek for the irruptive ideas which arise through free association, according to the psychoanalytic laws, from each separate dream element. From this material the latent dream thoughts may be discovered, exactly as one divines the concealed complexes of the patient from the fancies connected with his symptoms and memories. From the latent dream thoughts which you will find in this way, you will see at once how thoroughly justified one is in interpreting the dreams of adults by the same rubrics as those of children. What is now substituted for the manifest dream-content is the real sense of the dream, is always clearly comprehensible, associated with the impressions of the

day before, and appears as the fulfilling of an unsatisfied wish. The manifest dream, which we remember after waking, may then be described as a *disguised* fulfillment of *repressed* wishes.

It is also possible by a sort of synthesis to get some insight into the process which has brought about the disguise of the unconscious dream thoughts as the manifest dream-content. We call this process “dream-work” (*Traumarbeit*). This deserves our fullest theoretical interest, since here as nowhere else we can study the unsuspected psychic processes which are existent in the unconscious, or, to express it more exactly, *between* two such separate systems as the conscious and the unconscious. Among these newly discovered psychic processes, two, condensation (*Verdichtung*) and displacement or transvaluation, change of psychic accent (*Verschiebung*), stand out most prominently. Dream work is a special case of the reaction of different mental groupings on each other, and as such is the consequence of psychic fission. In all essential points it seems identical with the work of disguise, which changes the repressed complex in the case of failing repression into symptoms.

You will furthermore discover by the analysis of dreams, most convincingly your own, the unsuspected importance of the rôle which impressions and experiences from early childhood exert on the development of men. In the dream life the child, as it were, continues his existence in the man, with a retention of all his traits and wishes, including those which he was obliged to allow to fall into disuse in his later years. With irresistible might it will be impressed on you by what processes of development, of repression, sublimation and reaction there arises out of the child, with its peculiar gifts and tendencies, the so-called normal man, the bearer and partly the victim of our painfully acquired civilization. I will also direct your attention to the fact that we have discovered from the analysis of dreams that the unconscious makes use of a sort of symbolism, especially in the presentation of sexual complexes. This symbolism in part varies with the individual, but in part is of a typical nature, and seems to be identical with the symbolism which we suppose to lie behind our myths and legends. It is not impossible that these latter creations of the people may find their explanation from the study of dreams.

Finally, I must remind you that you must not be led astray by the objection that the occurrence of anxiety-dreams (*Angsttraüme*), contradicts our idea of the dream as a wish-fulfillment. Apart from the

consideration that anxiety-dreams also require interpretation before judgment can be passed on them, one can say quite generally that the anxiety does not depend in such a simple way on the dream content as one might suppose without more knowledge of the facts, and more attention to the conditions of neurotic anxiety. Anxiety is one of the ways in which the ego relieves itself of repressed wishes which have become too strong, and so is easy to explain in the dream, if the dream has gone too far towards the fulfilling of the objectionable wish.

You see that the investigation of dreams was justified by the conclusions which it has given us concerning things otherwise hard to understand. But we came to it in connection with the psychoanalytic treatment of neurotics. From what has been said you can easily understand how the interpretation of dreams, if it is not made too difficult by the resistance of the patient, can lead to a knowledge of the patient's concealed and repressed wishes and the complexes which he is nourishing. I may now pass to that group of everyday mental phenomena whose study has become a technical help for psychoanalysis.

These are the bungling of acts (*Fehlhandlungen*) among normal men as well as among neurotics, to which no significance is ordinarily attached; the forgetting of things which one is supposed to know and at other times really does know (for example the temporary forgetting of proper names); mistakes in speaking (*Versprechen*), which occur so frequently; analogous mistakes in writing (*Verschreiben*) and in reading (*Verlesen*), the automatic execution of purposive acts in wrong situations (*Vergreifen*) and the loss or breaking of objects, etc. These are trifles, for which no one has ever sought a psychological determination, which have passed unchallenged as chance experiences, as consequences of absent-mindedness, inattention and similar conditions. Here, too, are included the acts and gestures executed without being noticed by the subject, to say nothing of the fact that he attaches no psychic importance to them; as playing and trifling with objects, humming melodies, handling one's person and clothing and the like. [4]

These little things, the bungling of acts, like the symptomatic and chance acts (*Symptom- und Zufallshandlungen*) are not so entirely without meaning as is generally supposed by a sort of tacit agreement. They have a meaning, generally easy and sure to interpret from the situation in which they occur, and it can be demonstrated that they either express impulses

and purposes which are repressed, hidden if possible from the consciousness of the individual, or that they spring from exactly the same sort of repressed wishes and complexes which we have learned to know already as the creators of symptoms and dreams.

It follows that they deserve the rank of symptoms, and their observation, like that of dreams, can lead to the discovery of the hidden complexes of the psychic life. With their help one will usually betray the most intimate of his secrets. If these occur so easily and commonly among people in health, with whom repression has on the whole succeeded fairly well, this is due to their insignificance and their inconspicuous nature. But they can lay claim to high theoretic value, for they prove the existence of repression and surrogate creations even under the conditions of health. You have already noticed that the psychoanalyst is distinguished by an especially strong belief in the determination of the psychic life. For him there is in the expressions of the psyche nothing trifling, nothing arbitrary and lawless, he expects everywhere a widespread motivation, where customarily such claims are not made; more than that, he is even prepared to find a manifold motivation of these psychic expressions, while our supposedly inborn causal need is satisfied with a single psychic cause.

Now keeping in mind the means which we possess for the discovery of the hidden, forgotten, repressed things in the soul life: the study of the irruptive ideas called up by free association, the patient's dreams, and his bungled and symptomatic acts; and adding to these the evaluation of other phenomena which emerge during the psychoanalytic treatment, on which I shall later make a few remarks under the heading of "transfer" (*Ueberträgung*), you will come with me to the conclusion that our technique is already sufficiently efficacious for the solution of the problem of how to introduce the pathogenic psychic material into consciousness, and so to do away with the suffering brought on by the creation of surrogate symptoms.

The fact that by such therapeutic endeavors our knowledge of the mental life of the normal and the abnormal is widened and deepened, can of course only be regarded as an especial attraction and superiority of this method.

I do not know whether you have gained the impression that the technique through whose arsenal I have led you is a peculiarly difficult one. I consider that on the contrary, for one who has mastered it, it is quite

adapted for use. But so much is sure, that it is not obvious, that it must be learned no less than the histological or the surgical technique.

You may be surprised to learn that in Europe we have heard very frequently judgments passed on psychoanalysis by persons who knew nothing of its technique and had never practised it, but who demanded scornfully that we show the correctness of our results. There are among these people some who are not in other things unacquainted with scientific methods of thought, who for example would not reject the result of a microscopical research because it cannot be confirmed with the naked eye in anatomical preparations, and who would not pass judgment until they had used the microscope. But in matters of psychoanalysis circumstances are really more unfavorable for gaining recognition. Psychoanalysis will bring the repressed in mental life to conscious acknowledgment, and every one who judges it is himself a man who has such repressions perhaps only maintained with difficulty. It will consequently call forth the same resistances from him as from the patient, and this resistance can easily succeed in disguising itself as intellectual rejection, and bring forward arguments similar to those from which we protect our patients by the basic principles of psychoanalysis. It is not difficult to substantiate in our opponents the same impairment of intelligence produced by emotivity which we may observe every day with our patients. The arrogance of consciousness which for example rejects dreams so lightly, belongs — quite generally — to the strongest protective apparatus which guards us against the breaking through of the unconscious complexes, and as a result it is hard to convince people of the reality of the unconscious, and to teach them anew, what their conscious knowledge contradicts.

Fourth Lecture

LADIES and Gentlemen: At this point you will be asking what the technique which I have described has taught us of the nature of the pathogenic complexes and repressed wishes of neurotics.

One thing in particular: psychoanalytic investigations trace back the symptoms of disease with really surprising regularity to impressions from the sexual life, show us that the pathogenic wishes are of the nature of erotic impulse-components (*Triebkomponente*), and necessitate the assumption that to disturbances of the erotic sphere must be ascribed the greatest significance among the etiological factors of the disease. This holds of both sexes.

I know that this assertion will not willingly be credited. Even those investigators who gladly follow my psychological labors, are inclined to think that I overestimate the etiological share of the sexual moments. They ask me why other mental excitations should not lead to the phenomena of repression and surrogate-creation which I have described. I can give them this answer; that I do not know why they should not do this, I have no objection to their doing it, but experience shows that they do not possess such a significance, and that they merely support the effect of the sexual moments, without being able to supplant them. This conclusion was not a theoretical postulate; in the *Studien über Hysterie,* published in 1895 with Dr. Breuer, I did not stand on this ground. I was converted to it when my experience was richer and had led me deeper into the nature of the case. Gentlemen, there are among you some of my closest friends and adherents, who have travelled to Worcester with me. Ask them, and they will tell you that they all were at first completely sceptical of the assertion of the determinative significance of the sexual etiology, until they were compelled by their own analytic labors to come to the same conclusion.

The conduct of the patients does not make it any easier to convince one’s self of the correctness of the view which I have expressed. Instead of willingly giving us information concerning their sexual life, they try to conceal it by every means in their power. Men generally are not candid in sexual matters. They do not show their sexuality freely, but they wear a thick overcoat — a fabric of lies — to conceal it, as though it were bad weather in the world of sex. And they are not wrong; sun and wind are not favorable in our civilized society to any demonstration of sex life. In truth

no one can freely disclose his erotic life to his neighbor. But when your patients see that in your treatment they may disregard the conventional restraints, they lay aside this veil of lies, and then only are you in a position to formulate a judgment on the question in dispute. Unfortunately physicians are not favored above the rest of the children of men in their personal relationship to the questions of the sex life. Many of them are under the ban of that mixture of prudery and lasciviousness which determines the behaviour of most *Kulturmenschen* in affairs of sex.

Now to proceed with the communication of our results. It is true that in another series of cases psychoanalysis at first traces the symptoms back not to the sexual, but to banal traumatic experiences. But the distinction loses its significance through other circumstances. The work of analysis which is necessary for the thorough explanation and complete cure of a case of sickness does not stop in any case with the experience of the time of onset of the disease, but in every case it goes back to the adolescence and the early childhood of the patient. Here only do we hit upon the impressions and circumstances which determine the later sickness. Only the childhood experiences can give the explanation for the sensitivity to later traumata and only when these memory traces, which almost always are forgotten, are discovered and made conscious, is the power developed to banish the symptoms. We arrive here at the same conclusion as in the investigation of dreams — that it is the incompatible, repressed wishes of childhood which lend their power to the creation of symptoms. Without these the reactions upon later traumata discharge normally. But we must consider these mighty wishes of childhood very generally as sexual in nature.

Now I can at any rate be sure of your astonishment. Is there an infantile sexuality? you will ask. Is childhood not rather that period of life which is distinguished by the lack of the sexual impulse? No, gentlemen, it is not at all true that the sexual impulse enters into the child at puberty, as the devils in the gospel entered into the swine. The child has his sexual impulses and activities from the beginning, he brings them with him into the world, and from these the so-called normal sexuality of adults emerges by a significant development through manifold stages. It is not very difficult to observe the expressions of this childish sexual activity; it needs rather a certain art to overlook them or to fail to interpret them. [1]

As fate would have it, I am in a position to call a witness for my assertions from your own midst. I show you here the work of one Dr. Sanford Bell, published in 1902 in the *American Journal of Psychology.* The author was a fellow of Clark University, the same institution within whose walls we now stand. In this thesis, entitled “A Preliminary Study of the Emotion of Love between the Sexes,” which appeared three years before my “Drei Abhandlungen zur Sexualtheorie,” the author says just what I have been saying to you: “The emotion of sex love … does not make its appearance for the first time at the period of adolescence as has been thought.” He has, as we should say in Europe, worked by the American method, and has gathered not less than 2,500 positive observations in the course of fifteen years, among them 800 of his own. He says of the signs by which this amorous condition manifests itself: “The unprejudiced mind, in observing these manifestations in hundreds of couples of children, cannot escape referring them to sex origin. The most exacting mind is satisfied when to these observations are added the confessions of those who have as children experienced the emotion to a marked degree of intensity, and whose memories of childhood are relatively distinct.” Those of you who are unwilling to believe in infantile sexuality will be most astonished to hear that among those children who fell in love so early not a few are of the tender ages of three, four, and five years.

It would not be surprising if you should believe the observations of a fellow-countryman rather than my own. Fortunately a short time ago from the analysis of a five-year-old boy who was suffering from anxiety, an analysis undertaken with correct technique by his own father, [2] I succeeded in getting a fairly complete picture of the bodily expressions of the impulse and the mental productions of an early stage of childish sexual life. And I must remind you that my friend, Dr. C. G. Jung, read you a few hours ago in this room an observation on a still younger girl who from the same cause as my patient — the birth of a little child in the family — betrayed certainly almost the same secret excitement, wish and complex-creation. Accordingly I am not without hope that you may feel friendly toward this idea of infantile sexuality that was so strange at first. I might also quote the remarkable example of the Zürich psychiatrist, E. Bleuler, who said a few years ago openly that he faced my sexual theories incredulous and bewildered, and since that time by his own observations

had substantiated them in their whole scope. [3] If it is true that most men, medical observers and others, do not want to know anything about the sexual life of the child, the fact is capable of explanation only too easily. They have forgotten their own infantile sexual activity under the pressure of education for civilization and do not care to be reminded now of the repressed material. You will be convinced otherwise if you begin the investigation by a self-analysis, by an interpretation of your own childhood memories.

Lay aside your doubts and let us evaluate the infantile sexuality of the earliest years. [4] The sexual impulse of the child manifests itself as a very complex one, it permits of an analysis into many components, which spring from different sources. It is entirely disconnected from the function of reproduction which it is later to serve. It permits the child to gain different sorts of pleasure sensations, which we include, by the analogues and connections which they show, under the term sexual pleasures. The great source of infantile sexual pleasure is the auto-excitation of certain particularly sensitive parts of the body; besides the genitals are included the rectum and the opening of the urinary canal, and also the skin and other sensory surfaces. Since in this first phase of child sexual life the satisfaction is found on the child's own body and has nothing to do with any other object, we call this phase after a word coined by Havelock Ellis, that of "auto-erotism." The parts of the body significant in giving sexual pleasure we call "erogenous zones." The thumb-sucking (*Ludeln*) or passionate sucking (*Wonnesaugen*) of very young children is a good example of such an auto-erotic satisfaction of an erogenous zone. The first scientific observer of this phenomenon, a specialist in children's diseases in Budapest by the name of Lindner, interpreted these rightly as sexual satisfaction and described exhaustively their transformation into other and higher forms of sexual gratification. [5] Another sexual satisfaction of this time of life is the excitation of the genitals by masturbation, which has such a great significance for later life and, in the case of many individuals, is never fully overcome. Besides this and other auto-erotic manifestations we see very early in the child the impulse-components of *sexual pleasure,* or, as we may say, of the *libido,* which presupposes a second person as its object. These impulses appear in opposed pairs, as active and passive. The most important representatives of this group are the pleasure in inflicting pain (sadism) with its passive opposite (masochism) and active and

passive exhibition pleasure (*Schaulust*). From the first of these later pairs splits off the curiosity for knowledge, as from the latter the impulse toward artistic and theatrical representation. Other sexual manifestations of the child can already be regarded from the view-point of object-choice, in which the second person plays the prominent part. The significance of this was primarily based upon motives of the impulse of self-preservation. The difference between the sexes plays, however, in the child no very great rôle. One may attribute to every child, without wronging him, a bit of the homosexual disposition.

The sexual life of the child, rich, but dissociated, in which each single impulse goes about the business of arousing pleasure independently of every other, is later correlated and organized in two general directions, so that by the close of puberty the definite sexual character of the individual is practically finally determined. The single impulses subordinate themselves to the overlordship of the genital zone, so that the whole sexual life is taken over into the service of procreation, and their gratification is now significant only so far as they help to prepare and promote the true sexual act. On the other hand, object-choice prevails over auto-erotism, so that now in the sexual life all components of the sexual impulse are satisfied in the loved person. But not all the original impulse components are given a share in the final shaping of the sexual life. Even before the advent of puberty certain impulses have undergone the most energetic repression under the impulse of education, and mental forces like shame, disgust and morality are developed, which, like sentinels, keep the repressed wishes in subjection. When there comes, in puberty, the high tide of sexual desire it finds dams in this creation of reactions and resistances. These guide the outflow into the so-called normal channels, and make it impossible to revivify the impulses which have undergone repression.

The most important of these repressed impulses are koprophilism, that is, the pleasure in children connected with the excrements; and, further, the tendencies attaching themselves to the persons of the primitive object-choice.

Gentlemen, a sentence of general pathology says that every process of development brings with it the germ of pathological dispositions in so far as it may be inhibited, delayed, or incompletely carried out. This holds for the development of the sexual function, with its many complications. It is

not smoothly completed in all individuals, and may leave behind either abnormalities or disposition to later diseases by the way of later falling back or *regression.* It may happen that not all the partial impulses subordinate themselves to the rule of the genital zone. Such an impulse which has remained disconnected brings about what we call a perversion, which may replace the normal sexual goal by one of its own. It may happen, as has been said before, that the auto-erotism is not fully overcome, as many sorts of disturbances testify. The originally equal value of both sexes as sexual objects may be maintained and an inclination to homosexual activities in adult life result from this, which, under suitable conditions, rises to the level of exclusive homosexuality. This series of disturbances corresponds to the direct inhibition of development of the sexual function, it includes the perversions and the general *infantilism* of the sex life that are not seldom met with.

The disposition to neuroses is to be derived in another way from an injury to the development of the sex life. The neuroses are related to the perversions as the negative to the positive; in them we find the same impulse-components as in perversions, as bearers of the complexes and as creators of the symptoms; but here they work from out the unconscious. They have undergone a repression, but in spite of this they maintain themselves in the unconscious. Psychoanalysis teaches us that overstrong expression of the impulse in very early life leads to a sort of fixation (*Fixirung*), which then offers a weak point in the articulation of the sexual function. If the exercise of the normal sexual function meets with hindrances in later life, this repression, dating from the time of development, is broken through at just that point at which the infantile fixation took place.

You will now perhaps make the objection: “But all that is not sexuality.” I have used the word in a very much wider sense than you are accustomed to understand it. This I willingly concede. But it is a question whether you do not rather use the word in much too narrow a sense when you restrict it to the realm of procreation. You sacrifice by that the understanding of perversions; of the connection between perversion, neurosis and normal sexual life; and have no means of recognizing, in its true significance, the easily observable beginning of the somatic and mental sexual life of the child. But however you decide about the use of

the word, remember that the psychoanalyst understands sexuality in that full sense to which he is led by the evaluation of infantile sexuality.

Now we turn again to the sexual development of the child. We still have much to say here, since we have given more attention to the somatic than to the mental expressions of the sexual life. The primitive object-choice of the child, which is derived from his need of help, demands our further interest. It first attaches to all persons to whom he is accustomed, but soon these give way in favor of his parents. The relation of the child to his parents is, as both direct observation of the child and later analytic investigation of adults agree, not at all free from elements of sexual accessory-excitation (*Miterregung*). The child takes both parents, and especially one, as an object of his erotic wishes. Usually he follows in this the stimulus given by his parents, whose tenderness has very clearly the character of a sex manifestation, though inhibited so far as its goal is concerned. As a rule, the father prefers the daughter, the mother the son; the child reacts to this situation, since, as son, he wishes himself in the place of his father, as daughter, in the place of the mother. The feelings awakened in these relations between parents and children, and, as a resultant of them, those among the children in relation to each other, are not only positively of a tender, but negatively of an inimical sort. The complex built up in this way is destined to quick repression, but it still exerts a great and lasting effect from the unconscious. We must express the opinion that this with its ramifications presents the *nuclear complex* of every neurosis, and so we are prepared to meet with it in a not less effectual way in the other fields of mental life. The myth of King Œdipus, who kills his father and wins his mother as a wife is only the slightly altered presentation of the infantile wish, rejected later by the opposing barriers of incest. Shakespeare’s tale of Hamlet rests on the same basis of an incest complex, though better concealed. At the time when the child is still ruled by the still unrepressed nuclear complex, there begins a very significant part of his mental activity which serves sexual interest. He begins to investigate the question of where children come from and guesses more than adults imagine of the true relations by deduction from the signs which be sees. Usually his interest in this investigation is awakened by the threat to his welfare through the birth of another child in the family, in whom at first he sees only a rival. Under the influence of the partial impulses which are active in him be arrives at a number of

“infantile sexual theories,” as that the same male genitals belong to both sexes, that children are conceived by eating and born through the opening of the intestine, and that sexual intercourse is to be regarded as an inimical act, a sort of overpowering.

But just the unfinished nature of his sexual constitution and the gaps in his knowledge brought about by the hidden condition of the feminine sexual canal, cause the infant investigator to discontinue his work as a failure. The facts of this childish investigation itself as well as the infant sex theories created by it are of determinative significance in the building of the child’s character, and in the content of his later neuroses.

It is unavoidable and quite normal that the child should make his parents the objects of his first object-choice. But his *libido* must not remain fixed on these first chosen objects, but must take them merely as a prototype and transfer from these to other persons in the time of definite object-choice. The breaking loose (*Ablösung*) of the child from his parents is thus a problem impossible to escape if the social virtue of the young individual is not to be impaired. During the time that the repressive activity is making its choice among the partial sexual impulses and later, when the influence of the parents, which in the most essential way has furnished the material for these repressions, is lessened, great problems fall to the work of education, which at present certainly does not always solve them in the most intelligent and economic way.

Gentlemen, do not think that with these explanations of the sexual life and the sexual development of the child we have too far departed from psychoanalysis and the cure of neurotic disturbances. If you like, you may regard the psychoanalytic treatment only as a continued education for the overcoming of childhood-remnants (*Kindheitsresten*).

Fifth Lecture

LADIES and Gentlemen: With the discovery of infantile sexuality and the tracing back of the neurotic symptoms to erotic impulse-components we have arrived at several unexpected formulæ for expressing the nature and tendencies of neurotic diseases. We see that the individual falls ill when in consequence of outer hindrances or inner lack of adaptability the satisfaction of the erotic needs in the sphere of reality is denied. We see that he then flees to sickness, in order to find with its help a surrogate satisfaction for that denied him. We recognize that the symptoms of illness contain fractions of the sexual activity of the individual, or his whole sexual life, and we find in the turning away from reality the chief tendency and also the chief injury of the sickness. We may guess that the resistance of our patients against the cure is not a simple one, but is composed of many motives. Not only does the ego of the patient strive against the giving up of the repressions by which it has changed itself from its original constitution into its present form, but also the sexual impulses may not renounce their surrogate satisfaction so long as it is not certain that they can be offered anything better in the sphere of reality.

The flight from the unsatisfying reality into what we call, on account of its biologically injurious nature, disease, but which is never without an individual gain in pleasure for the patient, takes place over the path of regression, the return to earlier phases of the sexual life, when satisfaction was not lacking. This regression is seemingly a twofold one, a *temporal*, in so far as the *libido* or erotic need falls back to a temporally earlier stage of development, and a *formal*, since the original and primitive psychic means of expression are applied to the expression of this need. Both sorts of regression focus in childhood and have their common point in the production of an infantile condition of sexual life.

The deeper you penetrate into the pathogenesis of neurotic diseases, the more the connection of neuroses with other products of human mentality, even the most valuable, will be revealed to you. You will be reminded that we men, with the high claims of our civilization and under the pressure of our repressions, find reality generally quite unsatisfactory and so keep up a life of fancy in which we love to compensate for what is lacking in the sphere of reality by the production of wish-fulfillments. In these

phantasies is often contained very much of the particular constitutional essence of personality and of its tendencies, repressed in real life. The energetic and successful man is he who succeeds by dint of labor in transforming his wish fancies into reality. Where this is not successful in consequence of the resistance of the outer world and the weakness of the individual, there begins the turning away from reality. The individual takes refuge in his satisfying world of fancy. Under certain favorable conditions it still remains possible for him to find another connecting link between these fancies and reality, instead of permanently becoming a stranger to it through the regression into the infantile. If the individual who is displeased with reality is in possession of that *artistic talent* which is still a psychological riddle, be can transform his fancies into artistic creations. So he escapes the fate of a neurosis and wins back his connection with reality by this round-about way. [1] Where this opposition to the real world exists, but this valuable talent fails or proves insufficient, it is unavoidable that the *libido,* following the origin of the fancies, succeeds by means of regression in revivifying the infantile wishes and so producing a neurosis. The neurosis takes, in our time, the place of the cloister, in which were accustomed to take refuge all those whom life had undeceived or who felt themselves too weak for life. Let me give at this point the main result at which we have arrived by the psychoanalytic investigation of neurotics, namely, that neuroses have no peculiar psychic content of their own, which is not also to be found in healthy states; or, as C. G. Jung has expressed it, neurotics fall ill of the same complexes with which we sound people struggle. It depends on quantitative relationships, on the relations of the forces wrestling with each other, whether the struggle leads to health, to a neurosis, or to compensatory over-functioning (*Ueberleistung*).

Ladies and gentlemen, I have still withheld from you the most remarkable experience which corroborates our assumptions of the sexual impulse-forces of neurotics. Every time that we treat a neurotic psychoanalytically, there occurs in him the so-called phenomenon of *transfer* (Uebertragung), that is, he applies to the person of the physician a great amount of tender emotion, often mixed with enmity, which has no foundation in any real relation, and must be derived in every respect from the old wish-fancies of the patient which have become unconscious. Every fragment of his emotive life, which can no longer be called back into memory, is accordingly lived over by the patient in his relations to the

physician, and only by such a living of them over in the “transfer” is he convinced of the existence and the power of these unconscious sexual excitations. The symptoms, which, to use a simile from chemistry, are the precipitates of earlier love experiences (in the widest sense), can only be dissolved in the higher temperature of the experience of transfer and transformed into other psychic products. The physician plays in this reaction, to use an excellent expression of S. Ferenczi, [2] the rôle of a *catalytic ferment*, which temporarily attracts to itself the affect which has become free in the course of the process.

The study of transfer can also give you the key to the understanding of hypnotic suggestion, which we at first used with our patients as a technical means of investigation of the unconscious. Hypnosis showed itself at that time to be a therapeutic help, but a hindrance to the scientific knowledge of the real nature of the case, since it cleared away the psychic resistances from a certain field, only to pile them up in an unscalable wall at the boundaries of this field. You must not think that the phenomenon of transfer, about which I can unfortunately say only too little here, is created by the influence of the psychoanalytic treatment. The transfer arises spontaneously in all human relations and in the relations of the patient to the physician; it is everywhere the especial bearer of therapeutic influences, and it works the stronger the less one knows of its presence. Accordingly psychoanalysis does not create it, it merely discloses it to consciousness, and avails itself of it, in order to direct the psychic processes to the wished for goal. But I cannot leave the theme of transfer without stressing the fact that this phenomenon is of decisive importance to convince not only the patient, but also the physician. I know that all my adherents were first convinced of the correctness of my views through their experience with transfer, and I can very well conceive that one may not win such a surety of judgment so long as he makes no psychoanalysis, and so has not himself observed the effects of transfer.

Ladies and gentlemen, I am of the opinion that there are, on the intellectual side, two hindrances to acknowledging the value of the psychoanalytic view-point: first, the fact that we are not accustomed to reckon with a strict determination of mental life, which holds without exception, and second, the lack of knowledge of the peculiarities through which unconscious mental processes differ from those conscious ones with which we are familiar. One of the most widespread resistances against the

work of psychoanalysis with patients as with persons in health reduces to the latter of the two moments. One is afraid of doing harm by psychoanalysis, one is anxious about calling up into consciousness the repressed sexual impulses of the patient, as though there were danger that they could overpower the higher ethical strivings and rob him of his cultural acquisitions. One can see that the patient has sore places in his soul life, but one is afraid to touch them, lest his suffering be increased. We may use this analogy. It is, of course, better not to touch diseased places when one can only cause pain. But we know that the surgeon does not refrain from the investigation and reinvestigation of the seat of illness, if his invasion has as its aim the restoration of lasting health. Nobody thinks of blaming him for the unavoidable difficulties of the investigation or the phenomena of reaction from the operation, if these only accomplish their purpose, and gain for the patient a final cure by temporarily making his condition worse. The case is similar in psychoanalysis; it can lay claim to the same things as surgery; the increase of pain which takes place in the patient during the treatment is very much less than that which the surgeon imposes upon him, and especially negligible in comparison with the pains of serious illness. But the consequence which is feared, that of a disturbance of the cultural character by the impulse which has been freed from repression, is wholly impossible. In relation to this anxiety we must consider what our experiences have taught us with certainty, that the somatic and mental power of a wish, if once its repression has not succeeded, is incomparably stronger when it is unconscious than when it is conscious, so that by being made conscious it can only be weakened. The unconscious wish cannot be influenced, is free from all strivings in the contrary direction, while the conscious is inhibited by those wishes which are also conscious and which strive against it. The work of psychoanalysis accordingly presents a better substitute, in the service of the highest and most valuable cultural strivings, for the repression which has failed.

Now what is the fate of the wishes which have become free by psychoanalysis, by what means shall they be made harmless for the life of the individual? There are several ways. The general consequence is, that the wish is consumed during the work by the correct mental activity of those better tendencies which are opposed to it. The repression is supplanted by a condemnation carried through with the best means at one’s disposal. This is possible, since for the most part we have to abolish

only the effects of earlier developmental stages of the ego. The individual for his part only repressed the useless impulse, because at that time he was himself still incompletely organized and weak; in his present maturity and strength he can, perhaps, conquer without injury to himself that which is inimical to him. A second issue of the work of psychoanalysis may be that the revealed unconscious impulses can now arrive at those useful applications which, in the case of undisturbed development, they would have found earlier. The extirpation of the infantile wishes is not at all the ideal aim of development. The neurotic has lost, by his repressions, many sources of mental energy whose contingents would have been very valuable for his character building and his life activities. We know a far more purposive process of development, the so-called *sublimation* (*Sublimirung*), by which the energy of infantile wish-excitations is not secluded, but remains capable of application, while for the particular excitations, instead of becoming useless, a higher, eventually no longer sexual, goal is set up. The components of the sexual instinct are especially distinguished by such a capacity for the sublimation and exchange of their sexual goal for one more remote and socially more valuable. To the contributions of the energy won in such a way for the functions of our mental life we probably owe the highest cultural consequences. A repression taking place at an early period excludes the sublimation of the repressed impulse; after the removal of the repression the way to sublimation is again free.

We must not neglect, also, to glance at the third of the possible issues. A certain part of the suppressed libidinous excitation has a right to direct satisfaction and ought to find it in life. The claims of our civilization make life too hard for the greater part of humanity, and so further the aversion to reality and the origin of neuroses, without producing an excess of cultural gain by this excess of sexual repression. We ought not to go so far as to fully neglect the original animal part of our nature, we ought not to forget that the happiness of individuals cannot be dispensed with as one of the aims of our culture. The plasticity of the sexual-components, manifest in their capacity for sublimation, may cause a great temptation to accomplish greater culture-effects by a more and more far reaching sublimation. But just as little as with our machines we expect to change more than a certain fraction of the applied heat into useful mechanical work, just as little ought we to strive to separate the sexual impulse in its whole extent of

energy from its peculiar goal. This cannot succeed, and if the narrowing of sexuality is pushed too far it will have all the evil effects of a robbery.

I do not know whether you will regard the exhortation with which I close as a presumptuous one. I only venture the indirect presentation of my conviction, if I relate an old tale, whose application you may make yourselves. German literature knows a town called Schilda, to whose inhabitants were attributed all sorts of clever pranks. The wiseacres, so the story goes, had a horse, with whose powers of work they were well satisfied, and against whom they had only one grudge, that he consumed so much expensive oats. They concluded that by good management they would break him of this bad habit, by cutting down his rations by several stalks each day, until he had learned to do without them altogether. Things went finely for a while, the horse was weaned to one stalk a day, and on the next day he would at last work without fodder. On the morning of this day the malicious horse was found dead; the citizens of Schilda could not understand why he had died. We should be inclined to believe that the horse had starved, and that without a certain ration of oats no work could be expected from an animal.

I thank you for calling me here to speak, and for the attention which you have given me.

LEONARDO DA VINCI AND A MEMORY OF HIS CHILDHOOD

Translated by A. A. Brill

In 1910 Freud wrote this essay on Leonardo da Vinci's childhood, offering a psychoanalytic study of the great artist's life based on the painting *The Virgin and Child with St. Anne*. According to the Swiss Lutheran minister and lay psychoanalyst, Oskar Pfister, the Virgin's garment reveals a vulture when viewed sideways. Freud accepted this interpretation (in spite of the outlines resembling rather a duck than a vulture) as a supportive interpretation of his view of a "passive homosexual" childhood fantasy Leonardo wrote about in the Codex Atlanticus, when being attacked as an infant in his crib by the tail of a vulture. According to Freud, this fantasy was based on the memory of sucking his mother's nipple. He supported his claim with the fact that Egyptian hieroglyphs represent the mother as a vulture, as the Egyptians believed that there are no male vultures and that the females of the species are impregnated by the wind.

Another theory proposed by Freud attempts to explain Leonardo's fondness of depicting the Virgin Mary with St. Anne. Leonardo, who was illegitimate, was raised by his blood mother initially before being "adopted" by the wife of his father Ser Piero. The idea of depicting the Mother of God with her own mother was therefore particularly close to Leonardo's heart, as he, in a sense, had two mothers.

I

WHEN psychoanalytic investigation, which usually contents itself with frail human material, approaches the great personages of humanity, it is not impelled to it by motives which are often attributed to it by laymen. It does not strive “to blacken the radiant and to drag the sublime into the mire”; it finds no satisfaction in diminishing the distance between the perfection of the great and the inadequacy of the ordinary objects. But it cannot help finding that everything is worthy of understanding that can be perceived through those prototypes, and it also believes that none is so big as to be ashamed of being subject to the laws which control the normal and morbid actions with the same strictness.

Leonardo da Vinci (1452-1519) was admired even by his contemporaries as one of the greatest men of the Italian Renaissance, still even then he appeared as mysterious to them as he now appears to us. An all-sided genius, “whose form can only be divined but never deeply fathomed,” he exerted the most decisive influence on his time as an artist; and it remained to us to recognize his greatness as a naturalist which was united in him with the artist. Although he left masterpieces of the art of painting, while his scientific discoveries remained unpublished and unused, the investigator in him has never quite left the artist, often it has severely injured the artist and in the end it has perhaps suppressed the artist altogether. According to Vasari, Leonardo reproached himself during the last hour of his life for having insulted God and men because he has not done his duty to his art. And even if Vasari’s story lacks all probability and belongs to those legends which began to be woven about the mystic master while he was still living, it nevertheless retains indisputable value as a testimonial of the judgment of those people and of those times.

What was it that removed the personality of Leonardo from the understanding of his contemporaries? Certainly not the many sidedness of his capacities and knowledge, which allowed him to install himself as a player of the lyre on an instrument invented by himself, in the court of Lodovico Sforza, nicknamed Il Moro, the Duke of Milan, or which allowed him to write to the same person that remarkable letter in which he boasts of his abilities as a civil and military engineer. For the combination of manifold talents in the same person was not unusual in the times of the

Renaissance; to be sure Leonardo himself furnished one of the most splendid examples of such persons. Nor did he belong to that type of genial persons who are outwardly poorly endowed by nature, and who on their side place no value on the outer forms of life, and in the painful gloominess of their feelings fly from human relations. On the contrary he was tall and symmetrically built, of consummate beauty of countenance and of unusual physical strength, he was charming in his manner, a master of speech, and jovial and affectionate to everybody. He loved beauty in the objects of his surroundings, he was fond of wearing magnificent garments and appreciated every refinement of conduct. In his treatise on the art of painting he compares in a significant passage the art of painting with its sister arts and thus discusses the difficulties of the sculptor: “Now his face is entirely smeared and powdered with marble dust, so that he looks like a baker, he is covered with small marble splinters, so that it seems as if it snowed on his back, and his house is full of stone splinters, and dust. The case of the painter is quite different from that; for the painter is well dressed and sits with great comfort before his work, he gently and very lightly brushes in the beautiful colors. He wears as decorative clothes as he likes, and his house is filled with beautiful paintings and is spotlessly clean. He often enjoys company, music, or some one may read for him various nice works, and all this can be listened to with great pleasure, undisturbed by any pounding from the hammer and other noises.”

It is quite possible that the conception of a beaming jovial and happy Leonardo was true only for the first and longer period of the master’s life. From now on, when the downfall of the rule of Lodovico Moro forced him to leave Milan, his sphere of action and his assured position, to lead an unsteady and unsuccessful life until his last asylum in France, it is possible that the luster of his disposition became pale and some odd features of his character became more prominent. The turning of his interest from his art to science which increased with age must have also been responsible for widening the gap between himself and his contemporaries. All his efforts with which, according to their opinion, he wasted his time instead of diligently filling orders and becoming rich as perhaps his former classmate Perugino, seemed to his contemporaries as capricious playing, or even caused them to suspect him of being in the service of the “black art.” We who know him from his sketches understand him better. In a time in which the authority of the church began to be

substituted by that of antiquity and in which only theoretical investigation existed, he the forerunner, or better the worthy competitor of Bacon and Copernicus, was necessarily isolated. When he dissected cadavers of horses and human beings, and built flying apparatus, or when he studied the nourishment of plants and their behavior towards poisons, he naturally deviated much from the commentators of Aristotle and came nearer the despised alchemists, in whose laboratories the experimental investigations found some refuge during these unfavorable times.

The effect that this had on his paintings was that he disliked to handle the brush, he painted less and what was more often the case, the things he began were mostly left unfinished; he cared less and less for the future fate of his works. It was this mode of working that was held up to him as a reproach from his contemporaries to whom his behavior to his art remained a riddle.

Many of Leonardo's later admirers have attempted to wipe off the stain of unsteadiness from his character. They maintained that what is blamed in Leonardo is a general characteristic of great artists. They said that even the energetic Michelangelo who was absorbed in his work left many incompleted works, which was as little due to his fault as to Leonardo's in the same case. Besides some pictures were not as unfinished as he claimed, and what the layman would call a masterpiece may still appear to the creator of the work of art as an unsatisfied embodiment of his intentions; he has a faint notion of a perfection which he despairs of reproducing in likeness. Least of all should the artist be held responsible for the fate which befalls his works.

As plausible as some of these excuses may sound they nevertheless do not explain the whole state of affairs which we find in Leonardo. The painful struggle with the work, the final flight from it and the indifference to its future fate may be seen in many other artists, but this behavior is shown in Leonardo to highest degree. Edm. Solmi cites () the expression of one of his pupils: "Pareva, che ad ogni ora tremasse, quando si poneva a dipingere, e però no diede mai fine ad alcuna cosa cominciata, considerando la grandezza dell'arte, tal che egli scorgeva errori in quelle cose, che ad altri parevano miracoli." His last pictures, Leda, the Madonna di Saint Onofrio, Bacchus and St. John the Baptist, remained unfinished "come quasi intervenne di tutte le cose sue." Lomazzo, who finished a

copy of The Holy Supper, refers in a sonnet to the familiar inability of Leonardo to finish his works:

> “Protogen che il penel di sue pitture
> Non levava, agguaglio il Vinci Divo,
> Di cui opra non è finita pure.”

The slowness with which Leonardo worked was proverbial. After the most thorough preliminary studies he painted The Holy Supper for three years in the cloister of Santa Maria delle Grazie in Milan. One of his contemporaries, Matteo Bandelli, the writer of novels, who was then a young monk in the cloister, relates that Leonardo often ascended the scaffold very early in the morning and did not leave the brush out of his hand until twilight, never thinking of eating or drinking. Then days passed without putting his hand on it, sometimes he remained for hours before the painting and derived satisfaction from studying it by himself. At other times he came directly to the cloister from the palace of the Milanese Castle where he formed the model of the equestrian statue for Francesco Sforza, in order to add a few strokes with the brush to one of the figures and then stopped immediately. According to Vasari he worked for years on the portrait of Monna Lisa, the wife of the Florentine de Gioconda, without being able to bring it to completion. This circumstance may also account for the fact that it was never delivered to the one who ordered it but remained with Leonardo who took it with him to France. Having been procured by King Francis I, it now forms one of the greatest treasures of the Louvre.

When one compares these reports about Leonardo’s way of working with the evidence of the extraordinary amount of sketches and studies left by him, one is bound altogether to reject the idea that traits of flightiness and unsteadiness exerted the slightest influence on Leonardo’s relation to his art. On the contrary one notices a very extraordinary absorption in work, a richness in possibilities in which a decision could be reached only hestitatingly, claims which could hardly be satisfied, and an inhibition in the execution which could not even be explained by the inevitable backwardness of the artist behind his ideal purpose. The slowness which was striking in Leonardo’s works from the very beginning proved to be a symptom of his inhibition, a forerunner of his turning away from painting which manifested itself later. It was this slowness which decided the not

undeserving fate of The Holy Supper. Leonardo could not take kindly to the art of fresco painting which demands quick work while the background is still moist, it was for this reason that he chose oil colors, the drying of which permitted him to complete the picture according to his mood and leisure. But these colors separated themselves from the background upon which they were painted and which isolated them from the brick wall; the blemishes of this wall and the vicissitudes to which the room was subjected seemingly contributed to the inevitable deterioration of the picture.

The picture of the cavalry battle of Anghiari, which in competition with Michelangelo he began to paint later on a wall of the Sala de Consiglio in Florence and which he also left in an unfinished state, seemed to have perished through the failure of a similar technical process. It seems here as if a peculiar interest, that of the experimenter, at first reënforced the artistic, only later to damage the art production.

The character of the man Leonardo evinces still some other unusual traits and apparent contradictions. Thus a certain inactivity and indifference seemed very evident in him. At a time when every individual sought to gain the widest latitude for his activity, which could not take place without the development of energetic aggression towards others, he surprised every one through his quiet peacefulness, his shunning of all competition and controversies. He was mild and kind to all, he was said to have rejected a meat diet because he did not consider it just to rob animals of their lives, and one of his special pleasures was to buy caged birds in the market and set them free. He condemned war and bloodshed and designated man not so much as the king of the animal world, but rather as the worst of the wild beasts. But this effeminate delicacy of feeling did not prevent him from accompanying condemned criminals on their way to execution in order to study and sketch in his notebook their features, distorted by fear, nor did it prevent him from inventing the most cruel offensive weapons, and from entering the service of Cesare Borgia as chief military engineer. Often he seemed to be indifferent to good and evil, or he had to be measured with a special standard. He held a high position in Cesare’s campaign which gained for this most inconsiderate and most faithless of foes the possession of the Romagna. Not a single line of Leonardo’s sketches betrays any criticism or sympathy of the events of

those days. The comparison with Goethe during the French campaign cannot here be altogether rejected.

If a biographical effort really endeavors to penetrate the understanding of the psychic life of its hero it must not, as happens in most biographies through discretion or prudery, pass over in silence the sexual activity or the sex peculiarity of the one examined. What we know about it in Leonardo is very little but full of significance. In a period where there was a constant struggle between riotous licentiousness and gloomy asceticism, Leonardo presented an example of cool sexual rejection which one would not expect in an artist and a portrayer of feminine beauty. Solmi cites the following sentence from Leonardo showing his frigidity: “The act of procreation and everything that has any relation to it is so disgusting that human beings would soon die out if it were not a traditional custom and if there were no pretty faces and sensuous dispositions.” His posthumous works which not only treat of the greatest scientific problems but also comprise the most guileless objects which to us do not seem worthy of so great a mind (an allegorical natural history, animal fables, witticisms, prophecies), are chaste to a degree — one might say abstinent — that in a work of *belle lettres* would excite wonder even to-day. They evade everything sexual so thoroughly, as if Eros alone who preserves everything living was no worthy material for the scientific impulse of the investigator. It is known how frequently great artists found pleasure in giving vent to their phantasies in erotic and even grossly obscene representations; in contradistinction to this Leonardo left only some anatomical drawings of the woman’s internal genitals, the position of the child in the womb, etc.

It is doubtful whether Leonardo ever embraced a woman in love, nor is it known that he ever entertained an intimate spiritual relation with a woman as in the case of Michelangelo and Vittoria Colonna. While he still lived as an apprentice in the house of his master Verrocchio, he with other young men were accused of forbidden homosexual relations which ended in his acquittal. It seems that he came into this suspicion because he employed as a model a boy of evil repute. When he was a master he surrounded himself with handsome boys and youths whom he took as pupils. The last of these pupils Francesco Melzi, accompanied him to France, remained with him until his death, and was named by him as his heir. Without sharing the certainty of his modern biographers, who

naturally reject the possibility of a sexual relation between himself and his pupils as a baseless insult to this great man, it may be thought by far more probable that the affectionate relationships of Leonardo to the young men did not result in sexual activity. Nor should one attribute to him a high measure of sexual activity.

The peculiarity of this emotional and sexual life viewed in connection with Leonardo's double nature as an artist and investigator can be grasped only in one way. Of the biographers to whom psychological viewpoints are often very foreign, only one, Edm. Solmi, has to my knowledge approached the solution of the riddle. But a writer, Dimitri Sergewitsch Merejkowski, who selected Leonardo as the hero of a great historical novel has based his delineation on such an understanding of this unusual man, and if not in dry words he gave unmistakable utterance in plastic expression in the manner of a poet. Solmi judges Leonardo as follows: "But the unrequited desire to understand everything surrounding him, and with cold reflection to discover the deepest secret of everything that is perfect, has condemned Leonardo's works to remain forever unfinished." In an essay of the Conferenze Fiorentine the utterances of Leonardo are cited, which show his confession of faith and furnish the key to his character.

"Nessuna cosa si può amare nè odiare, se prima no si ha cognition di quella."

That is: One has no right to love or to hate anything if one has not acquired a thorough knowledge of its nature. And the same is repeated by Leonardo in a passage of the Treaties on the Art of Painting where he seems to defend himself against the accusation of irreligiousness:

"But such censurers might better remain silent. For that action is the manner of showing the workmaster so many wonderful things, and this is the way to love so great a discoverer. For, verily great love springs from great knowledge of the beloved object, and if you little know it you will be able to love it only little or not at all."

The value of these utterances of Leonardo cannot be found in that they impart to us an important psychological fact, for what they maintain is obviously false, and Leonardo must have known this as well as we do. It is not true that people refrain from loving or hating until they have studied and became familiar with the nature of the object to whom they wish to

give these affects, on the contrary they love impulsively and are guided by emotional motives which have nothing to do with cognition and whose affects are weakened, if anything, by thought and reflection. Leonardo only could have implied that the love practiced by people is not of the proper and unobjectionable kind, one should so love as to hold back the affect and to subject it to mental elaboration, and only after it has stood the test of the intellect should free play be given to it. And we thereby understand that he wishes to tell us that this was the case with himself and that it would be worth the effort of everybody else to treat love and hatred as he himself does.

And it seems that in his case it was really so. His affects were controlled and subjected to the investigation impulse, he neither loved nor hated, but questioned himself whence does that arise, which he was to love or hate, and what does it signify, and thus he was at first forced to appear indifferent to good and evil, to beauty and ugliness. During this work of investigation love and hatred threw off their designs and uniformly changed into intellectual interest. As a matter of fact Leonardo was not dispassionate, he did not lack the divine spark which is the mediate or immediate motive power — *il primo motore* — of all human activity. He only transmuted his passion into inquisitiveness. He then applied himself to study with that persistence, steadiness, and profundity which comes from passion, and on the height of the psychic work, after the cognition was won, he allowed the long checked affect to break loose and to flow off freely like a branch of a stream, after it has accomplished its work. At the height of his cognition when he could examine a big part of the whole he was seized with a feeling of pathos, and in ecstatic words he praised the grandeur of that part of creation which he studied, or — in religious cloak — the greatness of the creator. Solmi has correctly divined this process of transformation in Leonardo. According to the quotation of such a passage, in which Leonardo celebrated the higher impulse of nature (“O mirabile necessita ... “) he said: “Tale trasfigurazione della scienza della natura in emozione, quasi direi, religiosa, è uno dei tratti caratteristici de manoscritti vinciani, e si trova cento e cento volte espressa....”

Leonardo was called the Italian Faust on account of his insatiable and indefatigable desire for investigation. But even if we disregard the fact that it is the possible retransformation of the desire for investigation into the joys of life which is presupposed in the Faust tragedy, one might

venture to remark that Leonardo's system recalls Spinoza's mode of thinking.

The transformation of psychic motive power into the different forms of activity is perhaps as little convertible without loss, as in the case of physical powers. Leonardo's example teaches how many other things one must follow up in these processes. Not to love before one gains full knowledge of the thing loved presupposes a delay which is harmful. When one finally reaches cognition he neither loves nor hates properly; one remains beyond love and hatred. One has investigated instead of having loved. It is perhaps for this reason that Leonardo's life was so much poorer in love than those of other great men and great artists. The storming passions of the soul-stirring and consuming kind, in which others experience the best part of their lives, seem to have missed him.

There are still other consequences when one follows Leonardo's dictum. Instead of acting and producing one just investigates. He who begins to divine the grandeur of the universe and its needs readily forgets his own insignificant self. When one is struck with admiration and becomes truly humble he easily forgets that he himself is a part of that living force, and that according to the measure of his own personality he has the right to make an effort to change that destined course of the world, the world in which the insignificant is no less wonderful and important than the great.

Solmi thinks that Leonardo's investigations started with his art, he tried to investigate the attributes and laws of light, of color, of shades and of perspective so as to be sure of becoming a master in the imitation of nature and to be able to show the way to others. It is probable that already at that time he overestimated the value of this knowledge for the artist. Following the guide-rope of the painter's need, he was then driven further and further to investigate the objects of the art of painting, such as animals and plants, and the proportions of the human body, and to follow the path from their exterior to their interior structure and biological functions, which really also express themselves in their appearance and should be depicted in art. And finally he was pulled along by this overwhelming desire until the connection was torn from the demands of his art, so that he discovered the general laws of mechanics and divined the history of the stratification and fossilization of the Arno-valley, until he could enter in his book with capital letters the cognition: *Il sole non si move* (The sun

does not move). His investigations were thus extended over almost all realms of natural science, in every one of which he was a discoverer or at least a prophet or forerunner. However, his curiosity continued to be directed to the outer world, something kept him away from the investigation of the psychic life of men; there was little room for psychology in the “Academia Vinciana,” for which he drew very artistic and very complicated emblems.

When he later made the effort to return from his investigations to the art from which he started he felt that he was disturbed by the new paths of his interest and by the changed nature of his psychic work. In the picture he was interested above all in a problem, and behind this one he saw emerging numerous other problems just as he was accustomed in the endless and indeterminable investigations of natural history. He was no longer able to limit his demands, to isolate the work of art, and to tear it out from that great connection of which he knew it formed part. After the most exhausting efforts to bring to expression all that was in him, all that was connected with it in his thoughts, he was forced to leave it unfinished, or to declare it incomplete.

The artist had once taken into his service the investigator to assist him, now the servant was stronger and suppressed his master.

When we find in the portrait of a person one single impulse very forcibly developed, as curiosity in the case of Leonardo, we look for the explanation in a special constitution, concerning its probable organic determination hardly anything is known. Our psychoanalytic studies of nervous people lead us to look for two other expectations which we would like to find verified in every case. We consider it probable that this very forcible impulse was already active in the earliest childhood of the person, and that its supreme sway was fixed by infantile impressions; and we further assume that originally it drew upon sexual motive powers for its reënforcement so that it later can take the place of a part of the sexual life. Such person would then, e.g., investigate with that passionate devotion which another would give to his love, and he could investigate instead of loving. We would venture the conclusion of a sexual reënforcement not only in the impulse to investigate, but also in most other cases of special intensity of an impulse.

Observation of daily life shows us that most persons have the capacity to direct a very tangible part of their sexual motive powers to their

professional or business activities. The sexual impulse is particularly suited to yield such contributions because it is endowed with the capacity of sublimation, i.e., it has the power to exchange its nearest aim for others of higher value which are not sexual. We consider this process as proved, if the history of childhood or the psychic developmental history of a person shows that in childhood this powerful impulse was in the service of the sexual interest. We consider it a further corroboration if this is substantiated by a striking stunting in the sexual life of mature years, as if a part of the sexual activity had now been replaced by the activity of the predominant impulse.

The application of these assumptions to the case of the predominant investigation-impulse seems to be subject to special difficulties, as one is unwilling to admit that this serious impulse exists in children or that children show any noteworthy sexual interest. However, these difficulties are easily obviated. The untiring pleasure in questioning as seen in little children demonstrates their curiosity, which is puzzling to the grown-up, as long as he does not understand that all these questions are only circumlocutions, and that they cannot come to an end because they replace only one question which the child does not put. When the child becomes older and gains more understanding this manifestation of curiosity suddenly disappears. But psychoanalytic investigation gives us a full explanation in that it teaches us that many, perhaps most children, at least the most gifted ones, go through a period beginning with the third year, which may be designated as the period of *infantile sexual investigation*. As far as we know, the curiosity is not awakened spontaneously in children of this age, but is aroused through the impression of an important experience, through the birth of a little brother or sister, or through fear of the same endangered by some outward experience, wherein the child sees a danger to his egotistic interests. The investigation directs itself to the question whence children come, as if the child were looking for means to guard against such undesired event. We were astonished to find that the child refuses to give credence to the information imparted to it, e.g., it energetically rejects the mythological and so ingenious stork-fable, we were astonished to find that its psychic independence dates from this act of disbelief, that it often feels itself at serious variance with the grown-ups, and never forgives them for having been deceived of the truth on this occasion. It investigates in its own way, it divines that the child is in the

mother’s womb, and guided by the feelings of its own sexuality, it formulates for itself theories about the origin of children from food, about being born through the bowels, about the rôle of the father which is difficult to fathom, and even at that time it has a vague conception of the sexual act which appears to the child as something hostile, as something violent. But as its own sexual constitution is not yet equal to the task of producing children, his investigation whence come children must also run aground and must be left in the lurch as unfinished. The impression of this failure at the first attempt of intellectual independence seems to be of a persevering and profoundly depressing nature.

If the period of infantile sexual investigation comes to an end through an impetus of energetic sexual repression, the early association with sexual interest may result in three different possibilities for the future fate of the investigation impulse. The investigation either shares the fate of the sexuality, the curiosity henceforth remains inhibited and the free activity of intelligence may become narrowed for life; this is especially made possible by the powerful religious inhibition of thought, which is brought about shortly hereafter through education. This is the type of neurotic inhibition. We know well that the so acquired mental weakness furnishes effective support for the outbreak of a neurotic disease. In a second type the intellectual development is sufficiently strong to withstand the sexual repression pulling at it. Sometimes after the disappearance of the infantile sexual investigation, it offers its support to the old association in order to elude the sexual repression, and the suppressed sexual investigation comes back from the unconscious as compulsive reasoning, it is naturally distorted and not free, but forceful enough to sexualize even thought itself and to accentuate the intellectual operations with the pleasure and fear of the actual sexual processes. Here the investigation becomes sexual activity and often exclusively so, the feeling of settling the problem and of explaining things in the mind is put in place of sexual gratification. But the indeterminate character of the infantile investigation repeats itself also in the fact that this reasoning never ends, and that the desired intellectual feeling of the solution constantly recedes into the distance. By virtue of a special disposition the third, which is the most rare and most perfect type, escapes the inhibition of thought and the compulsive reasoning. Also here sexual repression takes place, it is unable, however, to direct a partial impulse of the sexual pleasure into the unconscious, but the libido

withdraws from the fate of the repression by being sublimated from the beginning into curiosity, and by reënforcing the powerful investigation impulse. Here, too, the investigation becomes more or less compulsive and a substitute of the sexual activity, but owing to the absolute difference of the psychic process behind it (sublimation in place of the emergence from the unconscious) the character of the neurosis does not manifest itself, the subjection to the original complexes of the infantile sexual investigation disappears, and the impulse can freely put itself in the service of the intellectual interest. It takes account of the sexual repression which made it so strong in contributing to it sublimated libido, by avoiding all occupation with sexual themes.

In mentioning the concurrence in Leonardo of the powerful investigation impulse with the stunting of his sexual life which was limited to the so-called ideal homosexuality, we feel inclined to consider him as a model example of our third type. The most essential point of his character and the secret of it seems to lie in the fact, that after utilizing the infantile activity of curiosity in the service of sexual interest he was able to sublimate the greater part of his libido into the impulse of investigation. But to be sure the proof of this conception is not easy to produce. To do this we would have to have an insight into the psychic development of his first childhood years, and it seems foolish to hope for such material when the reports concerning his life are so meager and so uncertain; and moreover, when we deal with information which even persons of our own generation withdraw from the attention of the observer.

We know very little concerning Leonardo’s youth. He was born in 1452 in the little city of Vinci between Florence and Empoli; he was an illegitimate child which was surely not considered a great popular stain in that time. His father was Ser Piero da Vinci, a notary and descendant of notaries and farmers, who took their name from the place Vinci; his mother, a certain Caterina, probably a peasant girl, who later married another native of Vinci. Nothing else about his mother appears in the life history of Leonardo, only the writer Merejkowski believed to have found some traces of her. The only definite information about Leonardo’s childhood is furnished by a legal document from the year 1457, a register of assessment in which Vinci Leonardo is mentioned among the members of the family as a five-year-old illegitimate child of Ser Piero. As the marriage of Ser Piero with Donna Albiera remained childless the little

Leonardo could be brought up in his father’s house. He did not leave this house until he entered as apprentice — it is not known what year — in the studio of Andrea del Verrocchio. In 1472 Leonardo’s name could already be found in the register of the members of the “Compagnia dei Pittori.” That is all.

II

As far as I know Leonardo only once interspersed in his scientific descriptions a communication from his childhood. In a passage where he speaks about the flight of the vulture, he suddenly interrupts himself in order to follow up a memory from very early years which came to his mind.

"*It seems that it had been destined before that I should occupy myself so thoroughly with the vulture, for it comes to my mind as a very early memory, when I was still in the cradle, a vulture came down to me, he opened my mouth with his tail and struck me a few times with his tail against my lips.*"

We have here an infantile memory and to be sure of the strangest sort. It is strange on account of its content and account of the time of life in which it was fixed. That a person could retain a memory of the nursing period is perhaps not impossible, but it can in no way be taken as certain. But what this memory of Leonardo states, namely, that a vulture opened the child's mouth with its tail, sounds so improbable, so fabulous, that another conception which puts an end to the two difficulties with one stroke appeals much more to our judgment. The scene of the vulture is not a memory of Leonardo, but a phantasy which he formed later, and transferred into his childhood. The childhood memories of persons often have no different origin, as a matter of fact, they are not fixated from an experience like the conscious memories from the time of maturity and then repeated, but they are not produced until a later period when childhood is already past, they are then changed and disguised and put in the service of later tendencies, so that in general they cannot be strictly differentiated from phantasies. Their nature will perhaps be best understood by recalling the manner in which history writing originated among ancient nations. As long as the nation was small and weak it gave no thought to the writing of its history, it tilled the soil of its land, defended its existence against its neighbors by seeking to wrest land from them and endeavored to become rich. It was a heroic but unhistoric time. Then came another age, a period of self-realization in which one felt rich and powerful, and it was then that one experienced the need to discover whence one originated and how one developed. The history-writing which

then continues to register the present events throws also its backward glance to the past, it gathers traditions and legends, it interprets what survived from olden times into customs and uses, and thus creates a history of past ages. It is quite natural that this history of the past ages is more the expressions of opinions and desires of the present than a faithful picture of the past, for many a thing escaped the people's memory, other things became distorted, some trace of the past was misunderstood and interpreted in the sense of the present; and besides one does not write history through motives of objective curiosity, but because one desires to impress his contemporaries, to stimulate and extol them, or to hold the mirror before them. The conscious memory of a person concerning the experiences of his maturity may now be fully compared to that of history writing, and his infantile memories, as far as their origin and reliability are concerned will actually correspond to the history of the primitive period of a people which was compiled later with purposive intent.

Now one may think that if Leonardo's story of the vulture which visited him in his cradle is only a phantasy of later birth, it is hardly worth while giving more time to it. One could easily explain it by his openly avowed inclination to occupy himself with the problem of the flight of the bird which would lend to this phantasy an air of predetermined fate. But with this depreciation one commits as great an injustice as if one would simply ignore the material of legends, traditions, and interpretations in the primitive history of a people. Notwithstanding all distortions and misunderstandings to the contrary they still represent the reality of the past; they represent what the people formed out of the experiences of its past age under the domination of once powerful and to-day still effective motives, and if these distortions could be unraveled through the knowledge of all effective forces, one would surely discover the historic truth under this legendary material. The same holds true for the infantile reminiscences or for the phantasies of individuals. What a person thinks he recalls from his childhood, is not of an indifferent nature. As a rule the memory remnants, which he himself does not understand, conceal invaluable evidences of the most important features of his psychic development. As the psychoanalytic technique affords us excellent means for bringing to light this concealed material, we shall venture the attempt to fill the gaps in the history of Leonardo's life through the analysis of his infantile phantasy. And if we should not attain a satisfactory degree of

certainty, we will have to console ourselves with the fact that so many other investigations about this great and mysterious man have met no better fate.

When we examine Leonardo's vulture-phantasy with the eyes of a psychoanalyst then it does not seem strange very long; we recall that we have often found similar structures in dreams, so that we may venture to translate this phantasy from its strange language into words that are universally understood. The translation then follows an erotic direction. Tail, "coda," is one of the most familiar symbols, as well as a substitutive designation of the male member which is no less true in Italian than in other languages. The situation contained in the phantasy, that a vulture opened the mouth of the child and forcefully belabored it with its tail, corresponds to the idea of fellatio, a sexual act in which the member is placed into the mouth of the other person. Strangely enough this phantasy is altogether of a passive character; it resembles certain dreams and phantasies of women and of passive homosexuals who play the feminine part in sexual relations.

Let the reader be patient for a while and not flare up with indignation and refuse to follow psychoanalysis because in its very first applications it leads to an unpardonable slander of the memory of a great and pure man. For it is quite certain that this indignation will never solve for us the meaning of Leonardo's childhood phantasy; on the other hand, Leonardo has unequivocally acknowledged this phantasy, and we shall therefore not relinquish the expectation — or if you prefer the preconception — that like every psychic production such as dreams, visions and deliria this phantasy, too, must have some meaning. Let us therefore lend our unprejudiced ears for a while to psychoanalytic work which after all has not yet uttered the last word.

The desire to take the male member into the mouth and suck it, which is considered as one of the most disgusting of sexual perversions, is nevertheless a frequent occurrence among the women of our time — and as shown in old sculptures was the same in earlier times — and in the state of being in love seems to lose entirely its disgusting character. The physician encounters phantasies based on this desire, even in women who did not come to the knowledge of the possibility of such sexual gratification by reading V. Krafft-Ebing's Psychopathia Sexualis or through other information. It seems that it is quite easy for the women

themselves to produce such wish-phantasies. Investigation then teaches us that this situation, so forcibly condemned by custom, may be traced to the most harmless origin. It is nothing but the elaboration of another situation in which we all once felt comfort, namely, when we were in the suckling-age (“when I was still in the cradle”) and took the nipple of our mother’s or wet-nurse’s breast into our mouth to suck it. The organic impression of this first pleasure in our lives surely remains indelibly impregnated; when the child later learns to know the udder of the cow, which in function is a breast-nipple, but in shape and in position on the abdomen resembles the penis, it obtains the primary basis for the later formation of that disgusting sexual phantasy.

We now understand why Leonardo displaced the memory of the supposed experience with the vulture to his nursing period. This phantasy conceals nothing more or less than a reminiscence of nursing — or being nursed — at the mother’s breast, a scene both human and beautiful, which he as well as other artists undertook to depict with the brush in the form of the mother of God and her child. At all events, we also wish to maintain, something we do not as yet understand, that this reminiscence, equally significant for both sexes, was elaborated in the man Leonardo into a passive homosexual phantasy. For the present we shall not take up the question as to what connection there is between homosexuality and suckling at the mother’s breast, we merely wish to recall that tradition actually designates Leonardo as a person of homosexual feelings. In considering this, it makes no difference whether that accusation against the youth Leonardo was justified or not. It is not the real activity but the nature of the feeling which causes us to decide whether to attribute to some one the characteristic of homosexuality.

Another incomprehensible feature of Leonardo’s infantile phantasy next claims our interest. We interpret the phantasy of being wet-nursed by the mother and find that the mother is replaced by a vulture. Where does this vulture originate and how does he come into this place?

A thought now obtrudes itself which seems so remote that one is tempted to ignore it. In the sacred hieroglyphics of the old Egyptians the mother is represented by the picture of the vulture. These Egyptians also worshiped a motherly deity, whose head was vulture like, or who had many heads of which at least one or two was that of a vulture. The name of this goddess was pronounced *Mut*; we may question whether the sound

similarity to our word mother (Mutter) is only accidental? So the vulture really has some connection with the mother, but of what help is that to us? Have we a right to attribute this knowledge to Leonardo when François Champollion first succeeded in reading hieroglyphics between 1790-1832?

It would also be interesting to discover in what way the old Egyptians came to choose the vulture as a symbol of motherhood. As a matter of fact the religion and culture of Egyptians were subjects of scientific interest even to the Greeks and Romans, and long before we ourselves were able to read the Egyptian monuments we had at our disposal some communications about them from preserved works of classical antiquity. Some of these writings belonged to familiar authors like Strabo, Plutarch, Aminianus Marcellus, and some bear unfamiliar names and are uncertain as to origin and time, like the hieroglyphica of Horapollo Nilus, and like the traditional book of oriental priestly wisdom bearing the godly name Hermes Trismegistos. From these sources we learn that the vulture was a symbol of motherhood because it was thought that this species of birds had only female vultures and no males. The natural history of the ancients shows a counterpart to this limitation among the scarebæus beetles which were revered by the Egyptians as godly, no females were supposed to exist.

But how does impregnation take place in vultures if only females exist? This is fully answered in a passage of Horapollo. At a certain time these birds stop in the midst of their flight, open their vagina and are impregnated by the wind.

Unexpectedly we have now reached a point where we can take something as quite probable which only shortly before we had to reject as absurd. It is quite possible that Leonardo was well acquainted with the scientific fable, according to which the Egyptians represented the idea of mother with the picture of the vulture. He was an omnivorous reader whose interest comprised all spheres of literature and knowledge. In the Codex Atlanticus we find an index of all books which he possessed at a certain time, as well as numerous notices about other books which he borrowed from friends, and according to the excerpts which Fr. Richter compiled from his drawings we can hardly overestimate the extent of his reading. Among these books there was no lack of older as well as contemporary works treating of natural history. All these books were already in print at that time, and it so happens that Milan was the principal place of the young art of book printing in Italy.

When we proceed further we come upon a communication which may raise to a certainty the probability that Leonardo knew the vulture fable. The erudite editor and commentator of Horapollo remarked in connection with the text () cited before: *Caeterum hanc fabulam de vulturibus cupide amplexi sunt Patres Ecclesiastici, ut ita argumento ex rerum natura petito refutarent eos, qui Virginis partum negabant; itaque apud omnes fere hujus rei mentio occurit.*

Hence the fable of the monosexuality and the conception of the vulture by no means remained as an indifferent anecdote as in the case of the analogous fable of the scarebæus beetles; that church fathers mastered it in order to have it ready as an argument from natural history against those who doubted the sacred history. If according the best information from antiquity the vultures were directed to let themselves be impregnated by the wind, why should the same thing not have happened even once in a human female? On account of this use the church fathers were “almost all” in the habit of relating this vulture fable, and now it can hardly remain doubtful that it also became known to Leonardo through so powerful a source.

The origin of Leonardo’s vulture phantasy can be conceived in the following manner: While reading in the writings of a church father or in a book on natural science that the vultures are all females and that they know to procreate without the coöperation of a male, a memory emerged in him which became transformed into that phantasy, but which meant to say that he also had been such a vulture child, which had a mother but no father. An echo of pleasure which he experienced at his mother’s breast was added to this in the manner as so old impressions alone can manifest themselves. The allusion to the idea of the holy virgin with the child, formed by the authors, which is so dear to every artist, must have contributed to it to make this phantasy seem to him valuable and important. For this helped him to identify himself with the Christ child, the comforter and savior of not alone this one woman.

When we break up an infantile phantasy we strive to separate the real memory content from the later motives which modify and distort the same. In the case of Leonardo we now think that we know the real content of the phantasy. The replacement of the mother by the vulture indicates that the child missed the father and felt himself alone with his mother. The fact of Leonardo’s illegitimate birth fits in with his vulture phantasy; only

on account of it was he able to compare himself with a vulture child. But we have discovered as the next definite fact from his youth that at the age of five years he had already been received in his father's home; when this took place, whether a few months following his birth, or a few weeks before the taking of the assessment of taxes, is entirely unknown to us. The interpretation of the vulture phantasy then steps in and wants to tell us that Leonardo did not spend the first decisive years of his life with his father and his step-mother but with his poor, forsaken, real mother, so that he had time to miss his father. This still seems to be a rather meager and rather daring result of the psychoanalytic effort, but on further reflection it will gain in significance. Certainty will be promoted by mentioning the actual relations in Leonardo's childhood. According to the reports, his father Ser Piero da Vinci married the prominent Donna Albiera during the year of Leonardo's birth; it was to the childlessness of this marriage that the boy owed his legalized reception into his father's or rather grandfather's house during his fifth year. However, it is not customary to offer an illegitimate offspring to a young woman's care at the beginning of marriage when she is still expecting to be blessed with children. Years of disappointment must have elapsed before it was decided to adopt the probably handsomely developed illegitimate child as a compensation for legitimate children who were vainly hoped for. It harmonizes best with the interpretation of the vulture-phantasy, if at least three years or perhaps five years of Leonardo's life had elapsed before he changed from his lonely mother to his father's home. But then it had already become too late. In the first three or four years of life impressions are fixed and modes of reactions are formed towards the outer world which can never be robbed of their importance by any later experiences.

If it is true that the incomprehensible childhood reminiscences and the person's phantasies based on them always bring out the most significant of his psychic development, then the fact corroborated by the vulture phantasy, that Leonardo passed the first years of his life alone with his mother must have been a most decisive influence on the formation of his inner life. Under the effect of this constellation it could not have been otherwise than that the child which in his young life encountered one problem more than other children, should have begun to ponder very passionately over this riddle and thus should have become an investigator early in life. For he was tortured by the great questions where do children

come from and what has the father to do with their origin. The vague knowledge of this connection between his investigation and his childhood history has later drawn from him the exclamation that it was destined that he should deeply occupy himself with the problem of the bird’s flight, for already in his cradle he had been visited by a vulture. To trace the curiosity which is directed to the flight of the bird to the infantile sexual investigation will be a later task which will not be difficult to accomplish.

III

The element of the vulture represents to us the real memory content in Leonardo's childhood phantasy; the association into which Leonardo himself placed his phantasy threw a bright light on the importance of this content for his later life. In continuing the work of interpretation we now encounter the strange problem why this memory content was elaborated into a homosexual situation. The mother who nursed the child, or rather from whom the child suckled was transformed into a vulture which stuck its tail into the child's mouth. We maintain that the "coda" (tail) of the vulture, following the common substituting usages of language, cannot signify anything else but a male genital or penis. But we do not understand how the phantastic activity came to furnish precisely this maternal bird with the mark of masculinity, and in view of this absurdity we become confused at the possibility of reducing this phantastic structure to rational sense.

However, we must not despair. How many seemingly absurd dreams have we not forced to give up their sense! Why should it become more difficult to accomplish this in a childhood phantasy than in a dream!

Let us remember the fact that it is not good to find one isolated peculiarity, and let us hasten to add another to it which is still more striking.

The vulture-headed goddess *Mut* of the Egyptians, a figure of altogether impersonal character, as expressed by Drexel in Roscher's lexicon, was often fused with other maternal deities of living individuality like Isis and Hathor, but she retained besides her separate existence and reverence. It was especially characteristic of the Egyptian pantheon that the individual gods did not perish in this amalgamation. Besides the composition of deities the simple divine image remained in her independence. In most representations the vulture-headed maternal deity was formed by the Egyptians in a phallic manner, her body which was distinguished as feminine by its breasts also bore the masculine member in a state of erection.

The goddess Mut thus evinced the same union of maternal and paternal characteristics as in Leonardo's vulture phantasy. Should we explain this concurrence by the assumption that Leonardo knew from studying his

book the androgynous nature of the maternal vulture? Such possibility is more than questionable; it seems that the sources accessible to him contained nothing of remarkable determination. It is more likely that here as there the agreement is to be traced to a common, effective and unknown motive.

Mythology can teach us that the androgynous formation, the union of masculine and feminine sex characteristics, did not belong to the goddess Mut alone but also to other deities such as Isis and Hathor, but in the latter perhaps only insofar as they possessed also a motherly nature and became fused with the goddess Mut. It teaches us further that other Egyptian deities such as Neith of Sais out of whom the Greek Athene was later formed, were originally conceived as androgynous or dihermaphroditic, and that the same held true for many of the Greek gods, especially of the Dionysian circle, as well as for Aphrodite who was later restricted to a feminine love deity. Mythology may also offer the explanation that the phallus which was added to the feminine body was meant to denote the creative primitive force of nature, and that all these hermaphroditic deistic formations express the idea that only a union of the masculine and feminine elements can result in a worthy representation of divine perfection. But none of these observations explain the psychological riddle, namely, that the phantasy of men takes no offense at the fact that a figure which was to embody the essence of the mother should be provided with the mark of the masculine power which is the opposite of motherhood.

The explanation comes from the infantile sexual theories. There really was a time in which the male genital was found to be compatible with the representation of the mother. When the male child first directs his curiosity to the riddle of the sexual life, he is dominated by the interest for his own genitals. He finds this part of the body too valuable and too important to believe that it would be missing in other persons to whom he feels such a resemblance. As he cannot divine that there is still another equally valuable type of genital formation he must grasp the assumption that all persons, also women, possess such a member as he. This preconception is so firm in the youthful investigator that it is not destroyed even by the first observation of the genitals in little girls. His perception naturally tells him that there is something different here than in him, but he is unable to admit to himself as the content of this perception

that he cannot find this member in girls. That this member may be missing is to him a dismal and unbearable thought, and he therefore seeks to reconcile it by deciding that it also exists in girls but it is still very small and that it will grow later. If this expectation does not appear to be fulfilled on later observation he has at his disposal another way of escape. The member also existed in the little girl but it was cut off and on its place there remained a wound. This progress of the theory already makes use of his own painful experience; he was threatened in the meantime that this important organ will be taken away from him if it will form too much of an interest for his occupation. Under the influence of this threat of castration he now interprets his conception of the female genital, henceforth he will tremble for his masculinity, but at the same time he will look with contempt upon those unhappy creatures upon whom, in his opinion, this cruel punishment had already been visited.

Before the child came under the domination of the castration complex, at the time when he still held the woman at her full value, he began to manifest an intensive desire to look as an erotic activity of his impulse. He wished to see the genitals of other persons, originally probably because he wished to compare them with his own. The erotic attraction which emanated from the person of his mother soon reached its height in the longing to see her genital which he believed to be a penis. With the cognition acquired only later that the woman has no penis, this longing often becomes transformed into its opposite and gives place to disgust, which in the years of puberty may become the cause of psychic impotence, of misogyny and of lasting homosexuality. But the fixation on the once so vividly desired object, the penis of the woman, leaves ineradicable traces in the psychic life of the child, which has gone through that fragment of infantile sexual investigation with particular thoroughness. The fetich-like reverence for the feminine foot and shoe seems to take the foot only as a substitutive symbol for the once revered and since then missed member of the woman. The “braid-slashers” without knowing it play the part of persons who perform the act of castration on the female genital.

One will not gain any correct understanding of the activities of the infantile sexuality and probably will consider these communications unworthy of belief, as long as one does not relinquish the attitude of our cultural depreciation of the genitals and of the sexual functions in general. To understand the infantile psychic life one has to look to analogies from

primitive times. For a long series of generations we have been in the habit of considering the genitals or *pudenda* as objects of shame, and in the case of more successful sexual repression as objects of disgust. The majority of those living to-day only reluctantly obey the laws of propagation, feeling thereby that their human dignity is being offended and degraded. What exists among us of the other conception of the sexual life is found only in the uncultivated and in the lower social strata; among the higher and more refined types it is concealed as culturally inferior, and its activity is ventured only under the embittered admonition of a guilty conscience. It was quite different in the primitive times of the human race. From the laborious collections of students of civilization one gains the conviction that the genitals were originally the pride and hope of living beings, they enjoyed divine worship, and the divine nature of their functions was transported to all newly acquired activities of mankind. Through sublimation of its essential elements there arose innumerable god-figures, and at the time when the relation of official religions with sexual activity was already hidden from the general consciousness, secret cults labored to preserve it alive among a number of the initiated. In the course of cultural development it finally happened that so much godliness and holiness had been extracted from sexuality that the exhausted remnant fell into contempt. But considering the indestructibility which is in the nature of all psychic impressions one need not wonder that even the most primitive forms of genital worship could be demonstrated until quite recent times, and that language, customs and superstitions of present day humanity contain the remnants of all phases of this course of development.

Important biological analogies have taught us that the psychic development of the individual is a short repetition of the course of development of the race, and we shall therefore not find improbable what the psychoanalytic investigation of the child's psyche asserts concerning the infantile estimation of the genitals. The infantile assumption of the maternal penis is thus the common source of origin for the androgynous formation of the maternal deities like the Egyptian goddess Mut and the vulture's "coda" (tail) in Leonardo's childhood phantasy. As a matter of fact, it is only through misunderstanding that these deistic representations are designated hermaphroditic in the medical sense of the word. In none of them is there a union of the true genitals of both sexes as they are united in some deformed beings to the disgust of every human eye; but besides the

breast as a mark of motherhood there is also the male member, just as it existed in the first imagination of the child about his mother's body. Mythology has retained for the faithful this revered and very early fancied bodily formation of the mother. The prominence given to the vulture-tail in Leonardo's phantasy we can now translate as follows: At that time when I directed my tender curiosity to my mother I still adjudged to her a genital like my own. A further testimonial of Leonardo's precocious sexual investigation, which in our opinion became decisive for his entire life.

A brief reflection now admonishes us that we should not be satisfied with the explanation of the vulture-tail in Leonardo's childhood phantasy. It seems as if it contained more than we as yet understand. For its more striking feature really consisted in the fact that the nursing at the mother's breast was transformed into being nursed, that is into a passive act which thus gives the situation an undoubted homosexual character. Mindful of the historical probability that Leonardo behaved in life as a homosexual in feeling, the question obtrudes itself whether this phantasy does not point to a causal connection between Leonardo's childhood relations to his mother and the later manifest, if only ideal, homosexuality. We would not venture to draw such conclusion from Leonardo's disfigured reminiscence were it not for the fact that we know from our psychoanalytic investigation of homosexual patients that such a relation exists, indeed it really is an intimate and necessary relation.

Homosexual men who have started in our times an energetic action against the legal limitations of their sexual activity are fond of representing themselves through theoretical spokesmen as evincing a sexual variation, which may be distinguished from the very beginning, as an intermediate stage of sex or as "a third sex." In other words, they maintain that they are men who are forced by organic determinants originating in the germ to find that pleasure in the man which they cannot feel in the woman. As much as one would wish to subscribe to their demands out of humane considerations, one must nevertheless exercise reserve regarding their theories which were formulated without regard for the psychic genesis of homosexuality. Psychoanalysis offers the means to fill this gap and to put to test the assertions of the homosexuals. It is true that psychoanalysis fulfilled this task in only a small number of people, but all investigation thus far undertaken brought the same surprising

results. In all our male homosexuals there was a very intensive erotic attachment to a feminine person, as a rule to the mother, which was manifest in the very first period of childhood and later entirely forgotten by the individual. This attachment was produced or favored by too much love from the mother herself, but was also furthered by the retirement or absence of the father during the childhood period. Sadger emphasizes the fact that the mothers of his homosexual patients were often man-women, or women with energetic traits of character who were able to crowd out the father from the place allotted to him in the family. I have sometimes observed the same thing, but I was more impressed by those cases in which the father was absent from the beginning or disappeared early so that the boy was altogether under feminine influence. It almost seems that the presence of a strong father would assure for the son the proper decision in the selection of his object from the opposite sex.

Following this primary stage, a transformation takes place whose mechanisms we know but whose motive forces we have not yet grasped. The love of the mother cannot continue to develop consciously so that it merges into repression. The boy represses the love for the mother by putting himself in her place, by identifying himself with her, and by taking his own person as a model through the similarity of which he is guided in the selection of his love object. He thus becomes homosexual; as a matter of fact he returns to the stage of autoerotism, for the boys whom the growing adult now loves are only substitutive persons or revivals of his own childish person, whom he loves in the same way as his mother loved him. We say that he finds his love object on the road to narcism, for the Greek legend called a boy Narcissus to whom nothing was more pleasing than his own mirrored image, and who became transformed into a beautiful flower of this name.

Deeper psychological discussions justify the assertion that the person who becomes homosexual in this manner remains fixed in his unconscious on the memory picture or his mother, By repressing the love for his mother he conserves the same in his unconscious and henceforth remains faithful to her. When as a lover he seems to pursue boys, he really thus runs away from women who could cause him to become faithless to his mother. Through direct observation of individual cases we could demonstrate that he who is seemingly receptive only of masculine stimuli is in reality influenced by the charms emanating from women just like a

normal person, but each and every time he hastens to transfer the stimulus he received from the woman to a male object and in this manner he repeats again and again the mechanism through which he acquired his homosexuality.

It is far from us to exaggerate the importance of these explanations concerning the psychic genesis of homosexuality. It is quite clear that they are in crass opposition to the official theories of the homosexual spokesmen, but we are aware that these explanations are not sufficiently comprehensive to render possible a final explanation of the problem. What one calls homosexual for practical purposes may have its origin in a variety of psychosexual inhibiting processes, and the process recognized by us is perhaps only one among many, and has reference only to one type of "homosexuality." We must also admit, that the number of cases in our homosexual type which shows the conditions required by us, exceeds by far those cases in which the resulting effect really appears, so that even we cannot reject the supposed coöperation of unknown constitutional factors from which one was otherwise wont to deduce the whole of homosexuality. As a matter of fact there would be no occasion for entering into the psychic genesis of the form of homosexuality studied by us if there were not a strong presumption that Leonardo, from whose vulture-phantasy we started, really belonged to this one type of homosexuality.

As little as is known concerning the sexual behavior of the great artist and investigator, we must still trust to the probability that the testimonies of his contemporaries did not go far astray. In the light of this tradition he appears to us as a man whose sexual need and activity were extraordinarily low, as if a higher striving had raised him above the common animal need of mankind. It may be open to doubt whether he ever sought direct sexual gratification, and in what manner, or whether he could dispense with it altogether. We are justified, however, to look also in him for those emotional streams which imperatively force others to the sexual act, for we cannot imagine a human psychic life in whose development the sexual desire in the broadest sense, the libido, has not had its share, whether the latter has withdrawn itself far from the original aim or whether it was detained from being put into execution.

Anything but traces of unchanged sexual desire we need not expect in Leonardo. These point however to one direction and allow us to count him among homosexuals. It has always been emphasized that he took as his

pupils only strikingly handsome boys and youths. He was kind and considerate towards them, he cared for them and nursed them himself when they were ill, just like a mother nurses her children, as his own mother might have cared for him. As he selected them on account of their beauty rather than their talent, none of them — Cesare da Sesto, G. Boltraffio, Andrea Salaino, Francesco Melzi and the others — ever became a prominent artist. Most of them could not make themselves independent of their master and disappeared after his death without leaving a more definite physiognomy to the history of art. The others who by their productions earned the right to call themselves his pupils, as Luini and Bazzi, nicknamed Sodoma, he probably did not know personally.

We realize that we will have to face the objection that Leonardo's behavior towards his pupils surely had nothing to do with sexual motives, and permits no conclusion as to his sexual peculiarity. Against this we wish to assert with all caution that our conception explains some strange features in the master's behavior which otherwise would have remained enigmatical. Leonardo kept a diary; he made entries in his small hand, written from right to left which were meant only for himself. It is to be noted that in this diary he addressed himself with "thou": "Learn from master Lucca the multiplication of roots." "Let master d'Abacco show thee the square of the circle." Or on the occasion of a journey he entered in his diary:

"I am going to Milan to look after the affairs of my garden ... order two pack-sacks to be made. Ask Boltraffio to show thee his turning-lathe and let him polish a stone on it. — Leave the book to master Andrea il Todesco." Or he wrote a resolution of quite different significance: "Thou must show in thy treatise that the earth is a star, like the moon or resembling it, and thus prove the nobility of our world."

In this diary, which like the diaries of other mortals often skim over the most important events of the day with only few words or ignore them altogether, one finds a few entries which on account of their peculiarity are cited by all of Leonardo's biographers. They show notations referring to the master's petty expenses, which are recorded with painful exactitude as if coming from a pedantic and strictly parsimonious family father, while there is nothing to show that he spent greater sums, or that the artist was well versed in household management. One of these notes refers to a new cloak which he bought for his pupil Andrea Salaino:

Silver brocade	Lira	15	Soldi	4
Crimson velvet for trimming	“	9	“	0
Braid	“	0	“	9
Buttons	“	0	“	12

Another very detailed notice gives all the expenses which he incurred through the bad qualities and the thieving tendencies of another pupil or model: “On 21st day of April, 1490, I started this book and started again the horse. Jacomo came to me on Magdalene day, 1490, at the age of ten years (marginal note: thievish, mendacious, willful, gluttonous). On the second day I ordered for him two shirts, a pair of pants, and a jacket, and as I put the money away to pay for the things named he stole the money from my purse, and it was never possible to make him confess, although I was absolutely sure of it (marginal note: 4 Lira ...).” So the report continues concerning the misdeeds of the little boy and concludes with the expense account: “In the first year, a cloak, Lira 2: 6 shirts, Lira 4: 3 jackets, Lira 6: 4 pair of socks, Lira 7, etc.”

Leonardo’s biographers, to whom nothing was further than to solve the riddle in the psychic life of their hero from these slight weaknesses and peculiarities, were wont to remark in connection with these peculiar accounts that they emphasized the kindness and consideration of the master for his pupils. They forget thereby that it is not Leonardo’s behavior that needs an explanation, but the fact that he left us these testimonies of it. As it is impossible to ascribe to him the motive of smuggling into our hands proofs of his kindness, we must assume that another affective motive caused him to write this down. It is not easy to conjecture what this motive was, and we could not give any if not for another account found among Leonardo’s papers which throws a brilliant light on these peculiarly petty notices about his pupils’ clothes, and others of a kind:

Burial expenses following the death of Caterina	27	florins
2 pounds wax	18	“

Cataphalc	12	“
For the transportation and erection of the cross	4	“
Pall bearers	8	“
To 4 priests and 4 clerics	20	“
Ringing of bells	2	“
To grave diggers	16	“
For the approval — to the officials	1	“
To sum up	108	florins
Previous expenses:		
To the doctor	4	florins
For sugar and candles	12	“
	16	florins
Sum total	124	florins

The writer Merejkowski is the only one who can tell us who this Caterina was. From two different short notices he concludes that she was the mother of Leonardo, the poor peasant woman from Vinci, who came to Milan in 1493 to visit her son then 41 years old. While on this visit she fell ill and was taken to the hospital by Leonardo, and following her death she was buried by her son with such sumptuous funeral.

This deduction of the psychological writer of romances is not capable of proof, but it can lay claim to so many inner probabilities, it agrees so well with everything we know besides about Leonardo’s emotional activity that I cannot refrain from accepting it as correct. Leonardo succeeded in forcing his feelings under the yoke of investigation and in inhibiting their free utterance, but even in him there were episodes in which the

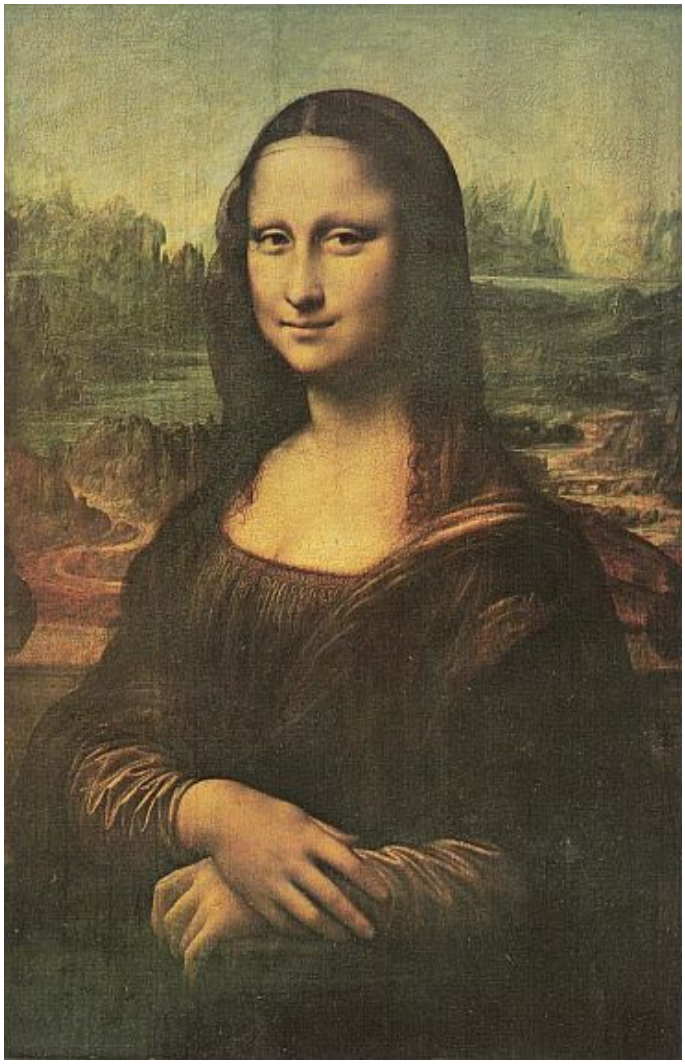
suppression obtained expression, and one of these was the death of his mother whom he once loved so ardently. Through this account of the burial expenses he represents to us the mourning of his mother in an almost unrecognizable distortion. We wonder how such a distortion could have come about, and we certainly cannot grasp it when viewed under normal mental processes. But similar mechanisms are familiar to us under the abnormal conditions of neuroses, and especially in the so-called *compulsion neurosis*. Here one can observe how the expressions of more intensive feelings have been displaced to trivial and even foolish performances. The opposing forces succeeded in debasing the expression of these repressed feelings to such an extent that one is forced to estimate the intensity of these feelings as extremely unimportant, but the imperative compulsion with which these insignificant acts express themselves betrays the real force of the feelings which are rooted in the unconscious, which consciousness would wish to disavow. Only by bearing in mind the mechanisms of compulsion neurosis can one explain Leonardo's account of the funeral expenses of his mother. In his unconscious he was still tied to her as in childhood, by erotically tinged feelings; the opposition of the repression of this childhood love which appeared later stood in the way of erecting to her in his diary a different and more dignified monument, but what resulted as a compromise of this neurotic conflict had to be put in operation and hence the account was entered in the diary which thus came to the knowledge of posterity as something incomprehensible.

It is not venturing far to transfer the interpretation obtained from the funeral expenses to the accounts dealing with his pupils. Accordingly we would say that here also we deal with a case in which Leonardo's meager remnants of libidinous feelings compulsively obtained a distorted expression. The mother and the pupils, the very images of his own boyish beauty, would be his sexual objects — as far as his sexual repression dominating his nature would allow such manifestations — and the compulsion to note with painful circumstantiality his expenses on their behalf, would designate the strange betrayal of his rudimentary conflicts. From this we would conclude that Leonardo's love-life really belonged to that type of homosexuality, the psychic development of which we were able to disclose, and the appearance of the homosexual situation in his vulture-phantasy would become comprehensible to us, for it states nothing

more or less than what we have asserted before concerning that type. It requires the following interpretation: Through the erotic relations to my mother I became a homosexual.

IV

The vulture phantasy of Leonardo still absorbs our interest. In words which only too plainly recall a sexual act (“and has many times struck against my lips with his tail”), Leonardo emphasizes the intensity of the erotic relations between the mother and the child. A second memory content of the phantasy can readily be conjectured from the association of the activity of the mother (of the vulture) with the accentuation of the mouth zone. We can translate it as follows: My mother has pressed on my mouth innumerable passionate kisses. The phantasy is composed of the memories of being nursed and of being kissed by the mother.



MONA LISA

A kindly nature has bestowed upon the artist the capacity to express in artistic productions his most secret psychic feelings hidden even to himself, which powerfully affect outsiders who are strangers to the artist without their being able to state whence this emotivity comes. Should there be no evidence in Leonardo's work of that which his memory retained as the strongest impression of his childhood? One would have to expect it. However, when one considers what profound transformations an impression of an artist has to experience before it can add its contribution to the work of art, one is obliged to moderate considerably his expectation of demonstrating something definite. This is especially true in the case of Leonardo.

He who thinks of Leonardo's paintings will be reminded by the remarkably fascinating and puzzling smile which he enchanted on the lips of all his feminine figures. It is a fixed smile on elongated, sinuous lips which is considered characteristic of him and is preferentially designated as "Leonardesque." In the singular and beautiful visage of the Florentine Monna Lisa del Giocondo it has produced the greatest effect on the spectators and even perplexed them. This smile was in need of an interpretation, and received many of the most varied kind but none of them was considered satisfactory. As Gruyer puts it: "It is almost four centuries since Monna Lisa causes all those to lose their heads who have looked upon her for some time."

Muther states: "What fascinates the spectator is the demoniacal charm of this smile. Hundreds of poets and writers have written about this woman, who now seems to smile upon us seductively and now to stare coldly and lifelessly into space, but nobody has solved the riddle of her smile, nobody has interpreted her thoughts. Everything, even the scenery is mysterious and dream-like, trembling as if in the sultriness of sensuality."

The idea that two diverse elements were united in the smile of Monna Lisa has been felt by many critics. They therefore recognize in the play of features of the beautiful Florentine lady the most perfect representation of the contrasts dominating the love-life of the woman which is foreign to man, as that of reserve and seduction, and of most devoted tenderness and inconsiderateness in urgent and consuming sensuality. Müntz expresses himself in this manner: "One knows what indecipherable and fascinating enigma Monna Lisa Gioconda has been putting for nearly four centuries to

the admirers who crowd around her. No artist (I borrow the expression of the delicate writer who hides himself under the pseudonym of Pierre de Corlay) has ever translated in this manner the very essence of femininity: the tenderness and coquetry, the modesty and quiet voluptuousness, the whole mystery of the heart which holds itself aloof, of a brain which reflects, and of a personality who watches itself and yields nothing from herself except radiance....” The Italian Angelo Conti saw the picture in the Louvre illumined by a ray of the sun and expressed himself as follows: “The woman smiled with a royal calmness, her instincts of conquest, of ferocity, the entire heredity of the species, the will of seduction and ensnaring, the charm of the deceiver, the kindness which conceals a cruel purpose, all that appears and disappears alternately behind the laughing veil and melts into the poem of her smile.... Good and evil, cruelty and compassion, graceful and cat-like, she laughed....”

Leonardo painted this picture four years, perhaps from 1503 until 1507, during his second sojourn in Florence when he was about the age of fifty years. According to Vasari he applied the choicest artifices in order to divert the lady during the sittings and to hold that smile firmly on her features. Of all the gracefulness that his brush reproduced on the canvas at that time the picture preserves but very little in its present state. During its production it was considered the highest that art could accomplish; it is certain, however, that it did not satisfy Leonardo himself, that he pronounced it as unfinished and did not deliver it to the one who ordered it, but took it with him to France where his benefactor Francis I, acquired it for the Louvre.

Let us leave the physiognomic riddle of Monna Lisa unsolved, and let us note the unequivocal fact that her smile fascinated the artist no less than all the spectators for these 400 years. This captivating smile had thereafter returned in all of his pictures and in those of his pupils. As Leonardo’s Monna Lisa was a portrait we cannot assume that he has added to her face a trait of his own so difficult to express which she herself did not possess. It seems, we cannot help but believe, that he found this smile in his model and became so charmed by it that from now on he endowed it on all the free creations of his phantasy. This obvious conception is, e.g., expressed by A. Konstantinowa in the following manner:

“During the long period in which the master occupied himself with the portrait of Monna Lisa del Gioconda, he entered into the physiognomic

delicacies of this feminine face with such sympathy of feeling that he transferred these creatures, especially the mysterious smile and the peculiar glance, to all faces which he later painted or drew. The mimic peculiarity of Gioconda can even be perceived in the picture of John the Baptist in the Louvre. But above all they are distinctly recognized in the features of Mary in the picture of St. Anne of the Louvre."

But the case could have been different. The need for a deeper reason for the fascination which the smile of Gioconda exerted on the artist from which he could not rid himself has been felt by more than one of his biographers. W. Pater, who sees in the picture of Monna Lisa the embodiment of the entire erotic experience of modern man, and discourses so excellently on "that unfathomable smile always with a touch of something sinister in it, which plays over all Leonardo's work," leads us to another track when he says:

"Besides, the picture is a portrait. From childhood we see this image defining itself on the fabric of his dream; and but for express historical testimony, we might fancy that this was but his ideal lady, embodied and beheld at last."

Herzfeld surely must have had something similar in mind when stating that in Monna Lisa Leonardo encountered himself and therefore found it possible to put so much of his own nature into the picture, "whose features from time immemorial have been imbedded with mysterious sympathy in Leonardo's soul."

Let us endeavor to clear up these intimations. It was quite possible that Leonardo was fascinated by the smile of Monna Lisa, because it had awakened something in him which had slumbered in his soul for a long time, in all probability an old memory. This memory was of sufficient importance to stick to him once it had been aroused; he was forced continually to provide it with new expression. The assurance of Pater that we can see an image like that of Monna Lisa defining itself from Leonardo's childhood on the fabric of his dreams, seems worthy of belief and deserves to be taken literally.

Vasari mentions as Leonardo's first artistic endeavors, "heads of women who laugh." The passage, which is beyond suspicion, as it is not meant to prove anything, reads more precisely as follows: "He formed in his youth some laughing feminine heads out of lime, which have been

reproduced in plaster, and some heads of children, which were as beautiful as if modeled by the hands of a master....”

Thus we discover that his practice of art began with the representation of two kinds of objects, which would perforce remind us of the two kinds of sexual objects which we have inferred from the analysis of his vulture phantasy. If the beautiful children’s heads were reproductions of his own childish person, then the laughing women were nothing else but reproductions of Caterina, his mother, and we are beginning to have an inkling of the possibility that his mother possessed that mysterious smile which he lost, and which fascinated him so much when he found it again in the Florentine lady.

SAINT ANNE

The painting of Leonardo which in point of time stands nearest to the Monna Lisa is the so-called Saint Anne of the Louvre, representing Saint Anne, Mary and the Christ child. It shows the Leonardesque smile most beautifully portrayed in the two feminine heads. It is impossible to find out how much earlier or later than the portrait of Monna Lisa Leonardo began to paint this picture. As both works extended over years, we may well assume that they occupied the master simultaneously. But it would best harmonize with our expectation if precisely the absorption in the features of Monna Lisa would have instigated Leonardo to form the composition of Saint Anne from his phantasy. For if the smile of Gioconda had conjured up in him the memory of his mother, we would naturally understand that he was first urged to produce a glorification of motherhood, and to give back to her the smile he found in that prominent lady. We may thus allow our interest to glide over from the portrait of Monna Lisa to this other hardly less beautiful picture, now also in the Louvre.

Saint Anne with the daughter and grandchild is a subject seldom treated in the Italian art of painting; at all events Leonardo's representation differs widely from all that is otherwise known. Muther states:

"Some masters like Hans Fries, the older Holbein, and Girolamo dei Libri, made Anne sit near Mary and placed the child between the two. Others like Jakob Cornelicz in his Berlin pictures, represented Saint Anne as holding in her arm the small figure of Mary upon which sits the still smaller figure of the Christ child." In Leonardo's picture Mary sits on her mother's lap, bent forward and is stretching out both arms after the boy who plays with a little lamb, and must have slightly maltreated it. The grandmother has one of her unconcealed arms propped on her hip and looks down on both with a blissful smile. The grouping is certainly not quite unconstrained. But the smile which is playing on the lips of both women, although unmistakably the same as in the picture of Monna Lisa, has lost its sinister and mysterious character; it expresses a calm blissfulness.

On becoming somewhat engrossed in this picture it suddenly dawns upon the spectator that only Leonardo could have painted this picture, as only he could have formed the vulture phantasy. This picture contains the synthesis of the history of Leonardo's childhood, the details of which are explainable by the most intimate impressions of his life. In his father's

home he found not only the kind step-mother Donna Albiera, but also the grandmother, his father's mother, Monna Lucia, who we will assume was not less tender to him than grandmothers are wont to be. This circumstance must have furnished him with the facts for the representation of a childhood guarded by a mother and grandmother. Another striking feature of the picture assumes still greater significance. Saint Anne, the mother of Mary and the grandmother of the boy who must have been a matron, is formed here perhaps somewhat more mature and more serious than Saint Mary, but still as a young woman of unfaded beauty. As a matter of fact Leonardo gave the boy two mothers, the one who stretched out her arms after him and another who is seen in the background, both are represented with the blissful smile of maternal happiness. This peculiarity of the picture has not failed to excite the wonder of the authors. Muther, for instance, believes that Leonardo could not bring himself to paint old age, folds and wrinkles, and therefore formed also Anne as a woman of radiant beauty. Whether one can be satisfied with this explanation is a question. Other writers have taken occasion to deny generally the sameness of age of mother and daughter. However, Muther's tentative explanation is sufficient proof for the fact that the impression of Saint Anne's youthful appearance was furnished by the picture and is not an imagination produced by a tendency.

Leonardo's childhood was precisely as remarkable as this picture. He has had two mothers, the first his true mother, Caterina, from whom he was torn away between the age of three and five years, and a young tender step-mother, Donna Albiera, his father's wife. By connecting this fact of his childhood with the one mentioned above and condensing them into a uniform fusion, the composition of Saint Anne, Mary and the Child, formed itself in him. The maternal form further away from the boy designated as grandmother, corresponds in appearance and in spatial relation to the boy, with the real first mother, Caterina. With the blissful smile of Saint Anne the artist actually disavowed and concealed the envy which the unfortunate mother felt when she was forced to give up her son to her more aristocratic rival, as once before her lover.

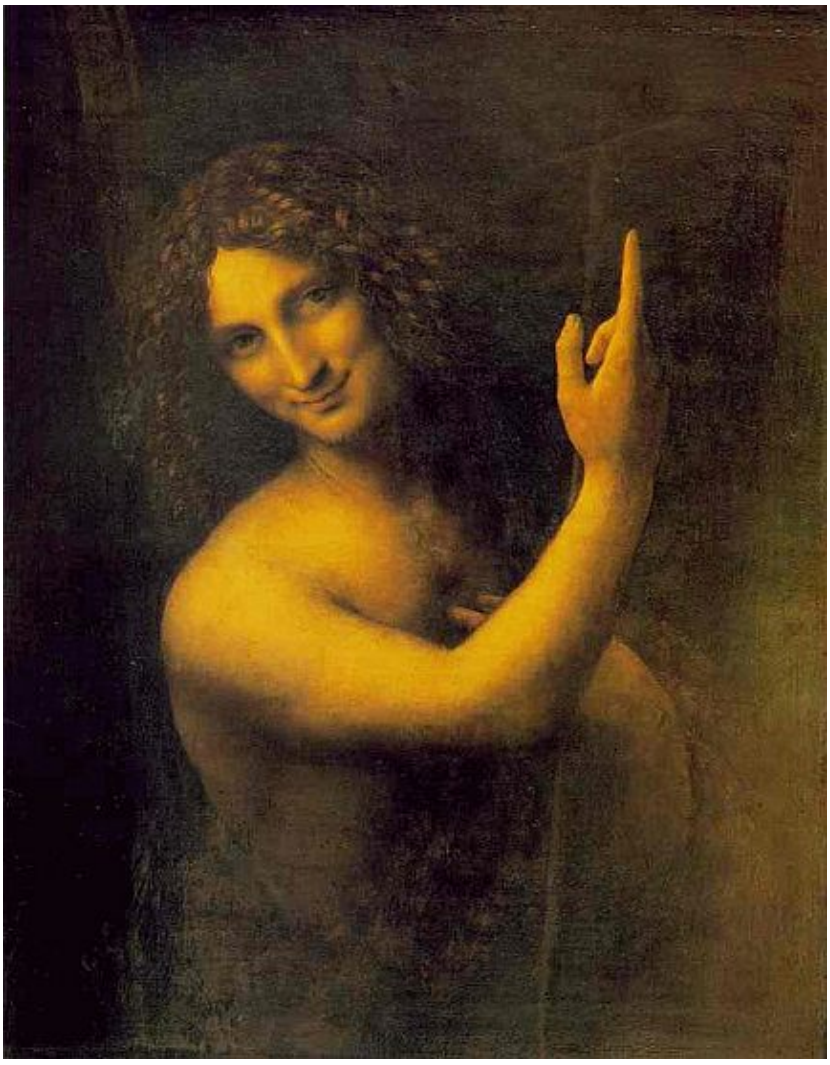
Our feeling that the smile of Monna Lisa del Gioconda awakened in the man the memory of the mother of his first years of childhood would thus be confirmed from another work of Leonardo. Following the production of Monna Lisa, Italian artists depicted in Madonnas and prominent ladies the

humble dipping of the head and the peculiar blissful smile of the poor peasant girl Caterina, who brought to the world the noble son who was destined to paint, investigate, and suffer.

When Leonardo succeeded in reproducing in the face of Monna Lisa the double sense comprised in this smile, namely, the promise of unlimited tenderness, and sinister threat (in the words of Pater), he remained true even in this to the content of his earliest reminiscence. For the love of the mother became his destiny, it determined his fate and the privations which were in store for him. The impetuosity of the caressing to which the vulture phantasy points was only too natural. The poor forsaken mother had to give vent through mother's love to all her memories of love enjoyed as well as to all her yearnings for more affection; she was forced to it, not only in order to compensate herself for not having a husband, but also the child for not having a father who wanted to love it. In the manner of all ungratified mothers she thus took her little son in place of her husband, and robbed him of a part of his virility by the too early maturing of his eroticism. The love of the mother for the suckling whom she nourishes and cares for is something far deeper reaching than her later affection for the growing child. It is of the nature of a fully gratified love affair, which fulfills not only all the psychic wishes but also all physical needs, and when it represents one of the forms of happiness attainable by man it is due, in no little measure, to the possibility of gratifying without reproach also wish feelings which were long repressed and designated as perverse. Even in the happiest recent marriage the father feels that his child, especially the little boy has become his rival, and this gives origin to an antagonism against the favorite one which is deeply rooted in the unconscious.

When in the prime of his life Leonardo re-encountered that blissful and ecstatic smile as it had once encircled his mother's mouth in caressing, he had long been under the ban of an inhibition, forbidding him ever again to desire such tenderness from women's lips. But as he had become a painter he endeavored to reproduce this smile with his brush and furnish all his pictures with it, whether he executed them himself or whether they were done by his pupils under his direction, as in Leda, John, and Bacchus. The latter two are variations of the same type. Muther says: "From the locust eater of the Bible Leonardo made a Bacchus, an Apollo, who with a mysterious smile on his lips, and with his soft thighs crossed, looks on us

with infatuated eyes.” These pictures breathe a mysticism into the secret of which one dares not penetrate; at most one can make the effort to construct the connection to Leonardo’s earlier productions. The figures are again androgynous but no longer in the sense of the vulture phantasy, they are pretty boys of feminine tenderness with feminine forms; they do not cast down their eyes but gaze mysteriously triumphant, as if they knew of a great happy issue concerning which one must remain quiet; the familiar fascinating smile leads us to infer that it is a love secret. It is possible that in these forms Leonardo disavowed and artistically conquered the unhappiness of his love life, in that he represented the wish fulfillment of the boy infatuated with his mother in such blissful union of the male and female nature.



JOHN THE BAPTIST

V

Among the entries in Leonardo's diaries there is one which absorbs the reader's attention through its important content and on account of a small formal error. In July, 1504, he wrote:

"Adi 9 Luglio, 1504, mercoledi, a ore 7 mori Ser Piero da Vinci notalio al palazzo del Potestà, mio padre, a ore 7. Era d'età d'anni 80, lasciò 10 figlioli maschi e 2 feminine."

The notice as we see deals with the death of Leonardo's father. The slight error in its form consists in the fact that in the computation of the time "at 7 o'clock" is repeated two times, as if Leonardo had forgotten at the end of the sentence that he had already written it at the beginning. It is only a triviality to which any one but a psychoanalyst would pay no attention. Perhaps he would not even notice it, or if his attention would be called to it he would say "that can happen to anybody during absent-mindedness or in an affective state and has no further meaning."

The psychoanalyst thinks differently; to him nothing is too trifling as a manifestation of hidden psychic processes; he has long learned that such forgetting or repetition is full of meaning, and that one is indebted to the "absent-mindedness" when it makes possible the betrayal of otherwise concealed feelings.

We would say that, like the funeral account of Caterina and the expense account of the pupils, this notice, too, corresponds to a case in which Leonardo was unsuccessful in suppressing his affects, and the long hidden feeling forcibly obtained a distorted expression. Also the form is similar, it shows the same pedantic precision, the same pushing forward of numbers.

We call such a repetition a perseveration. It is an excellent means to indicate the affective accentuation. One recalls for example Saint Peter's angry speech against his unworthy representative on earth, as given in Dante's Paradiso:

"Quegli ch'usurpa in terra il luoga mio
Il luoga mio, il luogo mio, che vaca
Nella presenza del Figliuol di Dio,
Fatto ha del cimiterio mio cloaca."

Without Leonardo's affective inhibition the entry into the diary could perhaps have read as follows: To-day at 7 o'clock died my father, Ser Piero da Vinci, my poor father! But the displacement of the perseveration to the most indifferent determination of the obituary to dying-hour robs the notice of all pathos and lets us recognize that there was something here to conceal and to suppress.

Ser Piero da Vinci, notary and descendant of notaries, was a man of great energy who attained respect and affluence. He was married four times, the two first wives died childless, and not till the third marriage has he gotten the first legitimate son, in 1476, when Leonardo was 24 years old, and had long ago changed his father's home for the studio of his master Verrocchio. With the fourth and last wife whom he married when he was already in the fifties he begot nine sons and two daughters.

To be sure the father also assumed importance in Leonardo's psychosexual development, and what is more, it was not only in a negative sense, through his absence during the boy's first childhood years, but also directly through his presence in his later childhood. He who as a child desires his mother, cannot help wishing to put himself in his father's place, to identify himself with him in his phantasy and later make it his life's task to triumph over him. As Leonardo was not yet five years old when he was received into his paternal home, the young step-mother, Albiera, certainly must have taken the place of his mother in his feeling, and this brought him into that relation of rivalry to his father which may be designated as normal. As is known, the preference for homosexuality did not manifest itself till near the years of puberty. When Leonardo accepted this preference the identification with the father lost all significance for his sexual life, but continued in other spheres of non-erotic activity. We hear that he was fond of luxury and pretty raiments, and kept servants and horses, although according to Vasari's words "he hardly possessed anything and worked little." We shall not hold his artistic taste entirely responsible for all these special likings; we recognize in them also the compulsion to copy his father and to excel him. He played the part of the great gentleman to the poor peasant girl, hence the son retained the incentive that he also play the great gentleman, he had the strong feeling "to out-herod Herod," and to show his father exactly how the real high rank looks.

Whoever works as an artist certainly feels as a father to his works. The identification with his father had a fateful result in Leonardo's works of art. He created them and then troubled himself no longer about them, just as his father did not trouble himself about him. The later worriments of his father could change nothing in this compulsion, as the latter originated from the impressions of the first years of childhood, and the repression having remained unconscious was incorrigible through later experiences.

At the time of the Renaissance, and even much later, every artist was in need of a gentleman of rank to act as his benefactor. This patron was wont to give the artist commissions for work and entirely controlled his destiny. Leonardo found his patron in Lodovico Sforza, nicknamed Il Moro, a man of high aspirations, ostentations, diplomatically astute, but of an unstable and unreliable character. In his court in Milan, Leonardo spent the best period of his life, while in his service he evinced his most uninhibited productive activity as is evidenced in The Last Supper, and in the equestrian statue of Francesco Sforza. He left Milan before the catastrophe struck Lodovico Moro, who died a prisoner in a French prison. When the news of his benefactor's fate reached Leonardo he made the following entry in his diary: "The duke has lost state, wealth, and liberty, not one of his works will be finished by himself." It is remarkable and surely not without significance that he here raises the same reproach to his benefactor that posterity was to apply to him, as if he wanted to lay the responsibility to a person who substituted his father-series, for the fact that he himself left his works unfinished. As a matter of fact he was not wrong in what he said about the Duke.

However, if the imitation of his father hurt him as an artist, his resistance against the father was the infantile determinant of his perhaps equally vast accomplishment as an artist. According to Merejkowski's beautiful comparison he was like a man who awoke too early in the darkness, while the others were all still asleep. He dared utter this bold principle which contains the justification for all independent investigation: *"Chi dispute allegando l'autorità non adopra l'ingegno ma piuttosto la memoria"* (Whoever refers to authorities in disputing ideas, works with his memory rather than with his reason). Thus he became the first modern natural philosopher, and his courage was rewarded by an abundance of cognitions and suggestions; since the Greek period he was the first to investigate the secrets of nature, relying entirely on his observation and

his own judgment. But when he learned to depreciate authority and to reject the imitation of the “ancients” and constantly pointed to the study of nature as the source of all wisdom, he only repeated in the highest sublimation attainable to man, which had already obtruded itself on the little boy who surveyed the world with wonder. To retranslate the scientific abstractions into concrete individual experiences, we would say that the “ancients” and authority only corresponded to the father, and nature again became the tender mother who nourished him. While in most human beings to-day, as in primitive times, the need for a support of some authority is so imperative that their world becomes shaky when their authority is menaced, Leonardo alone was able to exist without such support; but that would not have been possible had he not been deprived of his father in the first years of his life. The boldness and independence of his later scientific investigation presupposes that his infantile sexual investigation was not inhibited by his father, and this same spirit of scientific independence was continued by his withdrawing from sex.

If any one like Leonardo escapes in his childhood his father’s intimidation and later throws off the shackles of authority in his scientific investigation, it would be in gross contradiction to our expectation if we found that this same man remained a believer and unable to withdraw from dogmatic religion. Psychoanalysis has taught us the intimate connection between the father complex and belief in God, and daily demonstrates to us how youthful persons lose their religious belief as soon as the authority of the father breaks down. In the parental complex we thus recognize the roots of religious need; the almighty, just God, and kindly nature appear to us as grand sublimations of father and mother, or rather as revivals and restorations of the infantile conceptions of both parents. Religiousness is biologically traced to the long period of helplessness and need of help of the little child. When the child grows up and realizes his loneliness and weakness in the presence of the great forces of life, he perceives his condition as in childhood and seeks to disavow his despair through a regressive revival of the protecting forces of childhood.

It does not seem that Leonardo’s life disproves this conception of religious belief. Accusations charging him with irreligiousness, which in those times was equivalent to renouncing Christianity, were brought against him already in his lifetime, and were clearly described in the first biography given by Vasari. In the second edition of his Vite (1568) Vasari

left out this observation. In view of the extraordinary sensitiveness of his age in matters of religion it is perfectly comprehensible to us why Leonardo refrained from directly expressing his position to Christianity in his notes. As investigator he did not permit himself to be misled by the account of the creation of the holy scriptures; for instance, he disputed the possibility of a universal flood, and in geology he was as unscrupulous in calculating with hundred thousands of years as modern investigators.

Among his “prophecies” one finds some things that would perforce offend the sensitive feelings of a religious Christian, e.g. Praying to the images of Saints, reads as follows:

“People talk to people who perceive nothing, who have open eyes and see nothing; they shall talk to them and receive no answer; they shall adore those who have ears and hear nothing; they shall burn lamps for those who do not see.”

Or: Concerning mourning on Good Friday ():

“In all parts of Europe great peoples will bewail the death of one man who died in the Orient.”

It was asserted of Leonardo’s art that he took away the last remnant of religious attachment from the holy figures and put them into human form in order to depict in them great and beautiful human feelings. Muther praises him for having overcome the feeling of decadence, and for having returned to man the right of sensuality and pleasurable enjoyment. The notices which show Leonardo absorbed in fathoming the great riddles of nature do not lack any expressions of admiration for the creator, the last cause of all these wonderful secrets, but nothing indicates that he wished to hold any personal relation to this divine force. The sentences which contain the deep wisdom of his last years breathe the resignation of the man who subjects himself to the laws of nature and expects no alleviation from the kindness or grace of God. There is hardly any doubt that Leonardo had vanquished dogmatic as well as personal religion, and through his work of investigation he had withdrawn far from the world aspect of the religious Christian.

From our views mentioned before in the development of the infantile psychic life, it becomes clear that also Leonardo’s first investigations in childhood occupied themselves with the problems of sexuality. But he himself betrays it to us through a transparent veil, in that he connects his impulse to investigate with the vulture phantasy, and in emphasizing the

problem of the flight of the bird as one whose elaboration devolved upon him through special concatenations of fate. A very obscure as well as a prophetically sounding passage in his notes dealing with the flight of the bird demonstrates in the nicest way with how much affective interest he clung to the wish that he himself should be able to imitate, the art of flying: “The human bird shall take his first flight, filling the world with amazement, all writings with his fame, and bringing eternal glory to the nest whence he sprang.” He probably hoped that he himself would sometimes be able to fly, and we know from the wish fulfilling dreams of people what bliss one expects from the fulfillment of this hope.

But why do so many people dream that they are able to fly? Psychoanalysis answers this question by stating that to fly or to be a bird in the dream is only a concealment of another wish, to the recognition of which one can reach by more than one linguistic or objective bridge. When the inquisitive child is told that a big bird like the stork brings the little children, when the ancients have formed the phallus winged, when the popular designation of the sexual activity of man is expressed in German by the word “to bird” (vögeln), when the male member is directly called *l’uccello* (bird) by the Italians, all these facts are only small fragments from a large collection which teaches us that the wish to be able to fly signifies in the dream nothing more or less than the longing for the ability of sexual accomplishment. This is an early infantile wish. When the grown-up recalls his childhood it appears to him as a happy time in which one is happy for the moment and looks to the future without any wishes, it is for this reason that he envies children. But if children themselves could inform us about it they would probably give different reports. It seems that childhood is not that blissful Idyl into which we later distort it, that on the contrary children are lashed through the years of childhood by the wish to become big, and to imitate the grown ups. This wish instigates all their playing. If in the course of their sexual investigation children feel that the grown up knows something wonderful in the mysterious and yet so important realm, what they are prohibited from knowing or doing, they are seized with a violent wish to know it, and dream of it in the form of flying, or prepare this disguise of the wish for their later flying dreams. Thus aviation, which has attained its aim in our times, has also its infantile erotic roots.

By admitting that he entertained a special personal relation to the problem of flying since his childhood, Leonardo bears out what we must assume from our investigation of children of our times, namely, that his childhood investigation was directed to sexual matters. At least this one problem escaped the repression which has later estranged him from sexuality. From childhood until the age of perfect intellectual maturity this subject, slightly varied, continued to hold his interest, and it is quite possible that he was as little successful in his cherished art in the primary sexual sense as in his desires for mechanical matters, that both wishes were denied to him.

As a matter of fact the great Leonardo remained infantile in some ways throughout his whole life; it is said that all great men retain something of the infantile. As a grown up he still continued playing, which sometimes made him appear strange and incomprehensible to his contemporaries. When he constructed the most artistic mechanical toys for court festivities and receptions we are dissatisfied thereby because we dislike to see the master waste his power on such petty stuff. He himself did not seem averse to giving his time to such things. Vasari reports that he did similar things even when not urged to it by request: “There (in Rome) he made a doughy mass out of wax, and when it softened he formed thereof very delicate animals filled with air; when he blew into them they flew in the air, and when the air was exhausted they fell to the ground. For a peculiar lizard caught by the wine-grower of Belvedere Leonardo made wings from skin pulled off from other lizards, which he filled with mercury so that they moved and trembled when it walked; he then made for it eyes, a beard and horns, tamed it and put it in a little box and terrified all his friends with it.” Such playing often served him as an expression of serious thoughts: “He had often cleaned the intestines of a sheep so well that one could hold them in the hollow of the hand; he brought them into a big room, and attached them to a blacksmith’s bellows which he kept in an adjacent room, he then blew them up until they filled up the whole room so that everybody had to crowd into a corner. In this manner he showed how they gradually became transparent and filled up with air, and as they were at first limited to very little space and gradually became more and more extended in the big room, he compared them to a genius.” His fables and riddles evince the same playful pleasure in harmless concealment and

artistic investment, the riddles were put into the form of prophecies; almost all are rich in ideas and to a remarkable degree devoid of wit.

The plays and jumps which Leonardo allowed his phantasy have in some cases quite misled his biographers who misunderstood this part of his nature. In Leonardo's Milanese manuscripts one finds, for example, outlines of letters to the "Diodario of Sorio (Syria), viceroy of the holy Sultan of Babylon," in which Leonardo presents himself as an engineer sent to these regions of the Orient in order to construct some works. In these letters he defends himself against the reproach of laziness, he furnishes geographical descriptions of cities and mountains, and finally discusses a big elementary event which occurred while he was there.

In 1881, J. P. Richter had endeavored to prove from these documents that Leonardo made these traveler's observations when he really was in the service of the Sultan of Egypt, and that while in the Orient he embraced the Mohammedan religion. This sojourn in the Orient should have taken place in the time of 1483, that is, before he removed to the court of the Duke of Milan. However, it was not difficult for other authors to recognize the illustrations of this supposed journey to the Orient as what they really were, namely, phantastic productions of the youthful artist which he created for his own amusement, and in which he probably brought to expression his wishes to see the world and experience adventures.

A phantastic formation is probably also the "Academia Vinciana," the acceptance of which is due to the existence of five or six most clever and intricate emblems with the inscription of the Academy. Vasari mentions these drawings but not the Academy. Müntz who placed such ornament on the cover of his big work on Leonardo belongs to the few who believe in the reality of an "Academia Vinciana."

It is probable that this impulse to play disappeared in Leonardo's maturer years, that it became discharged in the investigating activity which signified the highest development of his personality. But the fact that it continued so long may teach us how slowly one tears himself away from his infantilism after having enjoyed in his childhood supreme erotic happiness which is later unattainable.

VI

It would be futile to delude ourselves that at present, readers find every pathography unsavory. This attitude is excused with the reproach that from a pathographic elaboration of a great man one never obtains an understanding of his importance and his attainments, that it is therefore useless mischief to study in him things which could just as well be found in the first comer. However, this criticism is so clearly unjust that it can only be grasped when viewed as a pretext and a disguise for something. As a matter of fact pathography does not aim at making comprehensible the attainments of the great man; no one should really be blamed for not doing something which one never promised. The real motives for the opposition are quite different. One finds them when one bears in mind that biographers are fixed on their heroes in quite a peculiar manner. Frequently they take the hero as the object of study because, for reasons of their personal emotional life, they bear him a special affection from the very outset. They then devote themselves to a work of idealization which strives to enroll the great men among their infantile models, and to revive through him, as it were, the infantile conception of the father. For the sake of this wish they wipe out the individual features in his physiognomy, they rub out the traces of his life's struggle with inner and outer resistances, and do not tolerate in him anything of human weakness or imperfection; they then give us a cold, strange, ideal form instead of the man to whom we could feel distantly related. It is to be regretted that they do this, for they thereby sacrifice the truth to an illusion, and for the sake of their infantile phantasies they let slip the opportunity to penetrate into the most attractive secrets of human nature.

Leonardo himself, judging from his love for the truth and his inquisitiveness, would have interposed no objections to the effort of discovering the determinations of his psychic and intellectual development from the trivial peculiarities and riddles of his nature. We respect him by learning from him. It does no injury to his greatness to study the sacrifices which his development from the child must have entailed, and to the compile factors which have stamped on his person the tragic feature of failure.

Let us expressly emphasize that we have never considered Leonardo as a neurotic or as a “nervous person” in the sense of this awkward term. Whoever takes it amiss that we should even dare apply to him viewpoints gained from pathology, still clings to prejudices which we have at present justly given up. We no longer believe that health and disease, normal and nervous, are sharply distinguished from each other, and that neurotic traits must be judged as proof of general inferiority. We know to-day that neurotic symptoms are substitutive formations for certain repressive acts which have to be brought about in the course of our development from the child to the cultural man, that we all produce such substitutive formations, and that only the amount, intensity, and distribution of these substitutive formations justify the practical conception of illness and the conclusion of constitutional inferiority. Following the slight signs in Leonardo’s personality we would place him near that neurotic type which we designate as the “compulsive type,” and we would compare his investigation with the “reasoning mania” of neurotics, and his inhibitions with the so-called “abulias” of the latter.

The object of our work was to explain the inhibitions in Leonardo’s sexual life and in his artistic activity. For this purpose we shall now sum up what we could discover concerning the course of his psychic development.

We were unable to gain any knowledge about his hereditary factors, on the other hand we recognize that the accidental circumstances of his childhood produced a far reaching disturbing effect. His illegitimate birth deprived him of the influence of a father until perhaps his fifth year, and left him to the tender seduction of a mother whose only consolation he was. Having been kissed by her into sexual prematurity, he surely must have entered into a phase of infantile sexual activity of which only one single manifestation was definitely evinced, namely, the intensity of his infantile sexual investigation. The impulse for looking and inquisitiveness were most strongly stimulated by his impressions from early childhood; the enormous mouth-zone received its accentuation which it had never given up. From his later contrasting behavior, as the exaggerated sympathy for animals, we can conclude that this infantile period did not lack in strong sadistic traits.

An energetic shift of repression put an end to this infantile excess, and established the dispositions which became manifest in the years of

puberty. The most striking result of this transformation was a turning away from all gross sensual activities. Leonardo was able to lead a life of abstinence and made the impression of an asexual person. When the floods of pubescent excitement came over the boy they did not make him ill by forcing him to costly and harmful substitutive formations; owing to the early preference for sexual inquisitiveness, the greater part of the sexual needs could be sublimated into a general thirst after knowledge and so elude repression. A much smaller portion of the libido was applied to sexual aims, and represented the stunted sexual life of the grown up. In consequence of the repression of the love for the mother this portion assumed a homosexual attitude and manifested itself as ideal love for boys. The fixation on the mother, as well as the happy reminiscences of his relations with her, was preserved in his unconscious but remained for the time in an inactive state. In this manner the repression, fixation, and sublimation participated in the disposal of the contributions which the sexual impulse furnished to Leonardo's psychic life.

From the obscure age of boyhood Leonardo appears to us as an artist, a painter, and sculptor, thanks to a specific talent which was probably enforced by the early awakening of the impulse for looking in the first years of childhood. We would gladly report in what way the artistic activity depends on the psychic primitive forces were it not that our material is inadequate just here. We content ourselves by emphasizing the fact, concerning which hardly any doubt still exists, that the productions of the artist give outlet also to his sexual desire, and in the case of Leonardo we can refer to the information imparted by Vasari, namely, that heads of laughing women and pretty boys, or representations of his sexual objects, attracted attention among his first artistic attempts. It seems that during his flourishing youth Leonardo at first worked in an uninhibited manner. As he took his father as a model for his outer conduct in life, he passed through a period of manly creative power and artistic productivity in Milan, where favored by fate he found a substitute for his father in the duke Lodovico Moro. But the experience of others was soon confirmed in him, to wit, that the almost complete suppression of the real sexual life does not furnish the most favorable conditions for the activity of the sublimated sexual strivings. The figurativeness of his sexual life asserted itself, his activity and ability to quick decisions began to weaken, the tendency to reflection and delay was already noticeable as a disturbance in

The Holy Supper, and with the influence of the technique determined the fate of this magnificent work. Slowly a process developed in him which can be put parallel only to the regressions of neurotics. His development at puberty into the artist was outstripped by the early infantile determinant of the investigator, the second sublimation of his erotic impulses turned back to the primitive one which was prepared at the first repression. He became an investigator, first in service of his art, later independently and away from his art. With the loss of his patron, the substitute for his father, and with the increasing difficulties in his life, the regressive displacement extended in dimension. He became *"impacientissimo al pennello"* (most impatient with the brush) as reported by a correspondent of the countess Isabella d'Este who desired to possess at any cost a painting from his hand. His infantile past had obtained control over him. The investigation, however, which now took the place of his artistic production, seems to have born certain traits which betrayed the activity of unconscious impulses; this was seen in his insatiability, his regardless obstinacy, and in his lack of ability to adjust himself to actual conditions.

At the summit of his life, in the age of the first fifties, at a time when the sex characteristics of the woman have already undergone a regressive change, and when the libido in the man not infrequently ventures into an energetic advance, a new transformation came over him. Still deeper strata of his psychic content became active again, but this further regression was of benefit to his art which was in a state of deterioration. He met the woman who awakened in him the memory of the happy and sensuously enraptured smile of his mother, and under the influence of this awakening he acquired back the stimulus which guided him in the beginning of his artistic efforts when he formed the smiling woman. He painted Monna Lisa, Saint Anne, and a number of mystic pictures which were characterized by the enigmatic smile. With the help of his oldest erotic feelings he triumphed in conquering once more the inhibition in his art. This last development faded away in the obscurity of the approaching old age. But before this his intellect rose to the highest capacity of a view of life, which was far in advance of his time.

In the preceding chapters I have shown what justification one may have for such representation of Leonardo's course of development, for this manner of arranging his life and explaining his wavering between art and science. If after accomplishing these things I should provoke the criticism

from even friends and adepts of psychoanalysis, that I have only written a psychoanalytic romance, I should answer that I certainly did not overestimate the reliability of these results. Like others I succumbed to the attraction emanating from this great and mysterious man, in whose being one seems to feel powerful propelling passions, which after all can only evince themselves so remarkably subdued.

But whatever may be the truth about Leonardo's life we cannot relinquish our effort to investigate it psychoanalytically before we have finished another task. In general we must mark out the limits which are set up for the working capacity of psychoanalysis in biography so that every omitted explanation should not be held up to us as a failure. Psychoanalytic investigation has at its disposal the data of the history of the person's life, which on the one hand consists of accidental events and environmental influences, and on the other hand of the reported reactions of the individual. Based on the knowledge of psychic mechanisms it now seeks to investigate dynamically the character of the individual from his reactions, and to lay bare his earliest psychic motive forces as well as their later transformations and developments. If this succeeds then the reaction of the personality is explained through the coöperation of constitutional and accidental factors or through inner and outer forces. If such an undertaking, as perhaps in the case of Leonardo, does not yield definite results then the blame for it is not to be laid to the faulty or inadequate psychoanalytic method, but to the vague and fragmentary material left by tradition about this person. It is, therefore, only the author who forced psychoanalysis to furnish an expert opinion on such insufficient material, who is to be held responsible for the failure.

However, even if one had at his disposal a very rich historical material and could manage the psychic mechanism with the greatest certainty, a psychoanalytic investigation could not possibly furnish the definite view, if it concerns two important questions, that the individual could turn out only so and not differently. Concerning Leonardo we had to represent the view that the accident of his illegitimate birth and the pampering of his mother exerted the most decisive influence on his character formation and his later fate, through the fact that the sexual repression following this infantile phase caused him to sublimate his libido into a thirst after knowledge, and thus determined his sexual inactivity for his entire later life. The repression, however, which followed the first erotic gratification

of childhood did not have to take place, in another individual it would perhaps not have taken place or it would have turned out not nearly as profuse. We must recognize here a degree of freedom which can no longer be solved psychoanalytically. One is as little justified in representing the issue of this shift of repression as the only possible issue. It is quite probable that another person would not have succeeded in withdrawing the main part of his libido from the repression through sublimation into a desire for knowledge; under the same influences as Leonardo another person might have sustained a permanent injury to his intellectual work or an uncontrollable disposition to compulsion neurosis. The two characteristics of Leonardo which remained unexplained through psychoanalytic effort are first, his particular tendency to repress his impulses, and second, his extraordinary ability to sublimate the primitive impulses.

The impulses and their transformations are the last things that psychoanalysis can discern. Henceforth it leaves the place to biological investigation. The tendency to repression, as well as the ability to sublimate, must be traced back to the organic bases of the character, upon which alone the psychic structure springs up. As artistic talent and productive ability are intimately connected with sublimation we have to admit that also the nature of artistic attainment is psychoanalytically inaccessible to us. Biological investigation of our time endeavors to explain the chief traits of the organic constitution of a person through the fusion of male and female predispositions in the material sense; Leonardo’s physical beauty as well as his left-handedness furnish here some support. However, we do not wish to leave the ground of pure psychologic investigation. Our aim remains to demonstrate the connection between outer experiences and reactions of the person over the path of the activity of the impulses. Even if psychoanalysis does not explain to us the fact of Leonardo’s artistic accomplishment, it still gives us an understanding of the expressions and limitations of the same. It does seem as if only a man with Leonardo’s childhood experiences could have painted Monna Lisa and Saint Anne, and could have supplied his works with that sad fate and so obtain unheard of fame as a natural historian; it seems as if the key to all his attainments and failures was hidden in the childhood phantasy of the vulture.

But may one not take offense at the results of an investigation which concede to the accidents of the parental constellation so decisive an influence on the fate of a person, which, for example, subordinates Leonardo's fate to his illegitimate birth and to the sterility of his first step-mother Donna Albiera? I believe that one has no right to feel so; if one considers accident as unworthy of determining our fate, it is only a relapse to the pious aspect of life, the overcoming of which Leonardo himself prepared when he put down in writing that the sun does not move. We are naturally grieved over the fact that a just God and a kindly providence do not guard us better against such influences in our most defenseless age. We thereby gladly forget that as a matter of fact everything in our life is accident from our very origin through the meeting of spermatozoa and ovum, accident, which nevertheless participates in the lawfulness and fatalities of nature, and lacks only the connection to our wishes and illusions. The division of life's determinants into the "fatalities" of our constitution and the "accidents" of our childhood may still be indefinite in individual cases, but taken altogether one can no longer entertain any doubt about the importance of precisely our first years of childhood. We all still show too little respect for nature, which in Leonardo's deep words recalling Hamlet's speech *"is full of infinite reasons which never appeared in experience."* Every one of us human beings corresponds to one of the infinite experiments in which these "reasons of nature" force themselves into experience.

THE END

TOTEM AND TABOO

RESEMBLANCES BETWEEN THE PSYCHIC LIVES OF SAVAGES AND NEUROTICS

Translated by A. A. Brill

First published in the journal *Imago* in 1913, *Totem and Taboo: Resemblances Between the Mental Lives of Savages and Neurotics* demonstrates Freud's application of psychoanalysis to the fields of archaeology, anthropology and the study of religion. The four essays in the collection are inspired by the work of Wilhelm Wundt and Carl Jung.

Freud examines the system of Totemism among the Australian Aborigines. Every clan has a totem (usually an animal, sometimes a plant or force of nature) and people are not allowed to marry those with the same totem as themselves. Freud examines this practice as a prevention against incest. The totem is passed down hereditarily, either through the father or the mother. The relationship of father is also not just his father, but every man in the clan that, hypothetically, could have been his father. He relates this to the idea of young children calling all of their parents' friends as aunts and uncles. There are also further marriage classes, sometimes as many as eight, who group the totems together, and therefore limit a man's choice of partners. He also talks about the widespread practices amongst the cultures of the Pacific Islands and Africa of avoidance. Many cultures do not allow brothers and sisters to interact in any way, generally after puberty. Men are not allowed to be alone with their mothers-in-law or say each other's names. He explains this by saying that after a certain age parents often live through their children to endure their marriage and that mothers-in-law may become overly attached to their son-in-law. Similar restrictions exist between a father and daughter, but they only exist from puberty until engagement.

AUTHOR'S PREFACE

THE essays treated here appeared under the subtitle of this book in the first numbers of the periodical *Imago* edited by me. They represent my first efforts to apply view-points and results of psychoanalysis to unexplained problems of racial psychology. In method this book contrasts with that of W. Wundt and the works of the Zurich Psychoanalytic School. The former tries to accomplish the same object through assumptions and procedures from non-analytic psychology, while the latter follow the opposite course and strive to settle problems of individual psychology by referring to material of racial psychology. I am pleased to say that the first stimulus for my own works came from these two sources.

I am fully aware of the shortcomings in these essays. I shall not touch upon those which are characteristic of first efforts at investigation. The others, however, demand a word of explanation. The four essays which are here collected will be of interest to a wide circle of educated people, but they can only be thoroughly understood and judged by those who are really acquainted with psychoanalysis as such. It is hoped that they may serve as a bond between students of ethnology, philology, folklore and of the allied sciences, and psychoanalysts; they cannot, however, supply both groups the entire requisites for such co-operation. They will not furnish the former with sufficient insight into the new psychological technique, nor will the psychoanalysts acquire through them an adequate command over the material to be elaborated. Both groups will have to content themselves with whatever attention they can stimulate here and there and with the hope that frequent meetings between them will not remain unproductive for science.

The two principal themes, totem and taboo, which give the name to this small book are not treated alike here. The problem of taboo is presented more exhaustively, and the effort to solve it is approached with perfect confidence. The investigation of totemism may be modestly expressed as: "This is all that psychoanalytic study can contribute at present to the elucidation of the problem of totemism." This difference in the treatment of the two subjects is due to the fact that taboo still exists in our midst. To be sure, it is negatively conceived and directed to different contents, but according to its psychological nature, it is still nothing else than Kant's

‘Categorical Imperative’, which tends to act compulsively and rejects all conscious motivations. On the other hand, totemism is a religio-social institution which is alien to our present feelings; it has long been abandoned and replaced by new forms. In the religions, morals, and customs of the civilized races of to-day it has left only slight traces, and even among those races where it is still retained, it has had to undergo great changes. The social and material progress of the history of mankind could obviously change taboo much less than totemism.

In this book the attempt is ventured to find the original meaning of totemism through its infantile traces, that is, through the indications in which it reappears in the development of our own children. The close connection between totem and taboo indicates the further paths to the hypothesis maintained here. And although this hypothesis leads to somewhat improbable conclusions, there is no reason for rejecting the possibility that it comes more or less near to the reality which is so hard to reconstruct.

TRANSLATOR'S INTRODUCTION

WHEN one reviews the history of psychoanalysis one finds that it had its inception in the study of morbid mental states. Beginning with the observation of hysteria and the other neuroses Professor Freud gradually extended his investigations to normal psychology and evolved new concepts and new methods of study. The neurotic symptoms were no longer imaginary troubles the nature of which one could not grasp, but were conceived as mental and emotional maladjustments to one's environment. The stamp of degeneracy impressed upon neurotics by other schools of medicine was altogether eradicated. Deeper investigation showed conclusively that a person might become neurotic if subjected to certain environments, and that there was no definite dividing line between normal and abnormal. The hysterical symptoms, obsessions, doubts, phobias, as well as hallucinations of the insane, show the same mechanisms as those similar psychic structures which one constantly encounters in normal persons in the form of mistakes in talking, reading, writing, forgetting, dreams and wit. The dream, always highly valued by the populace, and as much despised by the educated classes, has a definite structure and meaning when subjected to analysis. Professor Freud's monumental work, *The Interpretation of Dreams*, marked a new epoch in the history of mental science. One might use the same words in reference to his profound analysis of wit.

Faulty psychic actions, dreams and wit are products of the unconscious mental activity, and like neurotic or psychotic manifestations represent efforts at adjustment to one's environment. The slip of the tongue shows that on account of unconscious inhibitions the individual concerned is unable to express his true thoughts; the dream is a distorted or plain expression of those wishes which are prohibited in the waking states, and the witticism, owing to its veiled or indirect way of expression, enables the individual to obtain pleasure from forbidden sources. But whereas dreams, witticisms, and faulty actions give evidences of inner conflicts which the individual overcomes, the neurotic or psychotic symptom is the result of a failure and represents a morbid adjustment.

The aforementioned psychic formations are therefore nothing but manifestations of the struggle with reality, the constant effort to adjust

one’s primitive feelings to the demands of civilization. In spite of all later development the individual retains all his infantile psychic structures. Nothing is lost; the infantile wishes and primitive impulses can always be demonstrated in the grown-up and on occasion can be brought back to the surface. In his dreams the normal person is constantly reviving his childhood, and the neurotic or psychotic individual merges back into a sort of psychic infantilism through his morbid productions. The unconscious mental activity which is made up of repressed infantile material for ever tries to express itself. Whenever the individual finds it impossible to dominate the difficulties of the world of reality there is a regression to the infantile, and psychic disturbances ensue which are conceived as peculiar thoughts and acts. Thus the civilized adult is the result of his childhood or the sum total of his early impressions; psychoanalysis thus confirms the old saying: The child is father to the man.

It is at this point in the development of psychoanalysis that the paths gradually broadened until they finally culminated in this work. There were many indications that the childhood of the individual showed a marked resemblance to the primitive history or the childhood of races. The knowledge gained from dream analysis and phantasies, when applied to the productions of racial phantasies, like myths and fairy tales, seemed to indicate that the first impulse to form myths was due to the same emotional strivings which produced dreams, fancies and symptoms. Further study in this direction has thrown much light on our great cultural institutions, such as religion, morality, law and philosophy, all of which Professor Freud has modestly formulated in this volume and thus initiated a new epoch in the study of racial psychology.

I take great pleasure in acknowledging my indebtedness to Mr Alfred B. Kuttner for the invaluable assistance he rendered in the translation of this work.

A. A. BRILL.

CHAPTER I. THE SAVAGE'S DREAD OF INCEST

PRIMITIVE man is known to us by the stages of development through which he has passed: that is, through the inanimate monuments and implements which he has left behind for us, through our knowledge of his art, his religion and his attitude towards life, which we have received either directly or through the medium of legends, myths and fairy tales; and through the remnants of his ways of thinking that survive in our own manners and customs. Moreover, in a certain sense he is still our contemporary: there are people whom we still consider more closely related to primitive man than to ourselves, in whom we therefore recognize the direct descendants and representatives of earlier man. We can thus judge the so-called savage and semi-savage races; their psychic life assumes a peculiar interest for us, for we can recognize in their psychic life a well-preserved, early stage of our own development.

If this assumption is correct, a comparison of the 'Psychology of Primitive Races' as taught by folklore, with the psychology of the neurotic as it has become known through psychoanalysis will reveal numerous points of correspondence and throw new light on subjects that are more or less familiar to us.

For outer as well as for inner reasons, I am choosing for this comparison those tribes which have been described by ethnographists as being most backward and wretched: the aborigines of the youngest continent, namely Australia, whose fauna has also preserved for us so much that is archaic and no longer to be found elsewhere.

The aborigines of Australia are looked upon as a peculiar race which shows neither physical nor linguistic relationship with its nearest neighbours, the Melanesian, Polynesian and Malayan races. They do not build houses or permanent huts; they do not cultivate the soil or keep any domestic animals except dogs; and they do not even know the art of pottery. They live exclusively on the flesh of all sorts of animals which they kill in the chase, and on the roots which they dig. Kings or chieftains are unknown among them, and all communal affairs are decided by the elders in assembly. It is quite doubtful whether they evince any traces of religion in the form of worship of higher beings. The tribes living in the interior who have to contend with the greatest vicissitudes of life owing to

a scarcity of water, seem in every way more primitive than those who live near the coast.

We surely would not expect that these poor naked cannibals should be moral in their sex life according to our ideas, or that they should have imposed a high degree of restriction upon their sexual impulses. And yet we learn that they have considered it their duty to exercise the most searching care and the most painful rigour in guarding against incestuous sexual relations. In fact their whole social organization seems to serve this object or to have been brought into relation with its attainment.

Among the Australians the system of *Totemism* takes the place of all religious and social institutions. Australian tribes are divided into smaller *septs* or clans, each taking the name of its *totem.* Now what is a totem? As a rule it is an animal, either edible and harmless, or dangerous and feared; more rarely the totem is a plant or a force of nature (rain, water), which stands in a peculiar relation to the whole clan. The totem is first of all the tribal ancestor of the clan, as well as its tutelary spirit and protector; it sends oracles and, though otherwise dangerous, the totem knows and spares its children. The members of a totem are therefore under a sacred obligation not to kill (destroy) their totem, to abstain from eating its meat or from any other enjoyment of it. Any violation of these prohibitions is automatically punished. The character of a totem is inherent not only in a single animal or a single being but in all the members of the species. From time to time festivals are held at which the members of a totem represent or imitate, in ceremonial dances, the movements and characteristics of their totems.

The totem is hereditary either through the maternal or the paternal line; (maternal transmission probably always preceded and was only later supplanted by the paternal). The attachment to a totem is the foundation of all the social obligations of an Australian: it extends on the one hand beyond the tribal relationship, and on the other hand it supersedes consanguineous relationship.

The totem is not limited to district or to locality; the members of a totem may live separated from one another and on friendly terms with adherents of other totems.

And now, finally, we must consider that peculiarity of the totemic system which attracts the interest of the psychoanalyst. Almost everywhere the totem prevails there also exists the law that *the members of*

the same totem are not allowed to enter into sexual relations with each other; that is, that they cannot marry each other. This represents the *exogamy* which is associated with the totem.

This sternly maintained prohibition is very remarkable. There is nothing to account for it in anything that we have hitherto learned from the conception of the totem or from any of its attributes; that is, we do not understand how it happened to enter the system of totemism. We are therefore not astonished if some investigators simply assume that at first exogamy — both as to its origin and to its meaning — had nothing to do with totemism, but that it was added to it at some time without any deeper association, when marriage restrictions proved necessary. However that may be, the association of totemism and exogamy exists, and proves to be very strong.

Let us elucidate the meaning of this prohibition through further discussion.

(*a*) The violation of the prohibition is not left to what is, so to speak, an automatic punishment, as is the case with other violations of the prohibitions of the totem (e.g., not to kill the totem animal), but is most energetically avenged by the whole tribe as if it were a question of warding off a danger that threatens the community as a whole or a guilt that weighs upon all. A few sentences from Frazer's book will show how seriously such trespasses are treated by these savages who, according to our standard are otherwise very immoral.

"In Australia the regular penalty for sexual intercourse with a person of a forbidden clan is death. It matters not whether the woman is of the same local group or has been captured in war from another tribe; a man of the wrong clan who uses her as his wife is hunted down and killed by his clansmen, and so is the woman; though in some cases, if they succeed in eluding capture for a certain time, the offence may be condoned. In the Ta-Ta-thi tribe, New South Wales, in the rare cases which occur, the man is killed, but the woman is only beaten or speared, or both, till she is nearly dead; the reason given for not actually killing her being that she was probably coerced. Even in casual amours the clan prohibitions are strictly observed; any violations of these prohibitions 'are regarded with the utmost abhorrence and are punished by death' (Howitt)."

(*b*) As the same severe punishment is also meted out for temporary love affairs which have not resulted in childbirth, the assumption of other

motives, perhaps of a practical nature, becomes improbable.

(*c*) As the totem is hereditary and is not changed by marriage, the results of the prohibition, for instance in the case of maternal heredity, are easily perceived. If, for example, the man belongs to a clan with the totem of the Kangaroo and marries a woman of the Emu totem, the children, both boys and girls, are all Emu. According to the totem law incestuous relations with his mother and his sister, who are Emu like himself, are therefore made impossible for a son of this marriage.

(*d*) But we need only a reminder to realize that the exogamy connected with the totem accomplishes more; that is, aims at more than the prevention of incest with the mother or the sisters. It also makes it impossible for the man to have sexual union with all the women of his own group, with a number of females, therefore, who are not consanguineously related to him, by treating all these women like blood relations. The psychological justification for this extraordinary restriction, which far exceeds anything comparable to it among civilized races, is not, at first, evident. All we seem to understand is that the rôle of the totem (the animal) as ancestor is taken very seriously. Everybody descended from the same totem is consanguineous; that is, of one family; and in this family the most distant grades of relationship are recognized as an absolute obstacle to sexual union.

Thus these savages reveal to us an unusually high grade of incest dread or incest sensitiveness, combined with the peculiarity, which we do not very well understand, of substituting the totem relationship for the real blood relationship. But we must not exaggerate this contradiction too much, and let us bear in mind that the totem prohibitions include real incest as a special case.

In what manner the substitution of the totem group for the actual family has come about remains a riddle, the solution of which is perhaps bound up with the explanation of the totem itself. Of course it must be remembered that with a certain freedom of sexual intercourse, extending beyond the limitations of matrimony, the blood relationship, and with it also the prevention of incest, becomes so uncertain that we cannot dispense with some other basis for the prohibition. It is therefore not superfluous to note that the customs of Australians recognize social conditions and festive occasions at which the exclusive conjugal right of a man to a woman is violated.

The linguistic customs of these tribes, as well as of most totem races, reveals a peculiarity which undoubtedly is pertinent in this connection. For the designations of relationship of which they make use do not take into consideration the relationship between two individuals, but between an individual and his group; they belong, according to the expression of L. H. Morgan, to the ‘classifying’ system. That means that a man calls not only his begetter ‘father’ but also every other man who, according to the tribal regulations, might have married his mother and thus become his father; he calls ‘mother’ not only the woman who bore him but also every other woman who might have become his mother without violation of the tribal laws; he calls ‘brothers’ and ‘sisters’ not only the children of his real parents, but also the children of all the persons named who stand in the parental group relation with him, and so on. The kinship names which two Australians give each other do not, therefore, necessarily point to a blood relationship between them, as they would have to according to the custom of our language; they signify much more the social than the physical relations. An approach to this classifying system is perhaps to be found in our nursery, when the child is induced to greet every male and female friend of the parents as ‘uncle’ and ‘aunt’, or it may be found in a transferred sense when we speak of ‘Brothers in Apollo’, or ‘Sisters in Christ’.

The explanation of this linguistic custom, which seems so strange to us, is simple if looked upon as a remnant and indication of those marriage institutions which the Rev. L. Fison has called ‘group marriage’, characterized by a number of men exercising conjugal rights over a number of women. The children of this group marriage would then rightly look upon each other as brothers and sisters although not born of the same mother, and would take all the men of the group for their fathers.

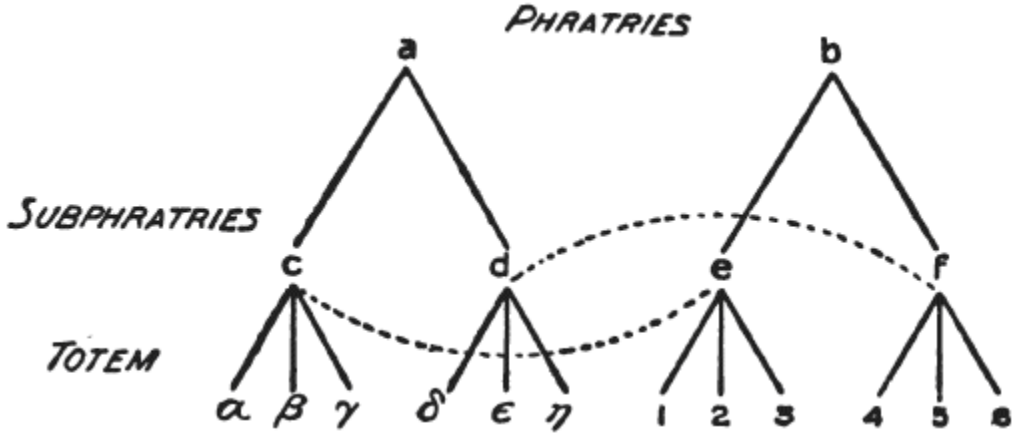
Although a number of authors, as, for instance, B. Westermarck in his *History of Human Marriage*, oppose the conclusions which others have drawn from the existence of group-relationship names, the best authorities on the Australian savages are agreed that the classificatory relationship names must be considered as survivals from the period of group marriages. And, according to Spencer and Gillen, a certain form of group marriage can be established as still existing to-day among the tribes of the Urabunna and the Dieri. Group marriage therefore preceded individual

marriage among these races, and did not disappear without leaving distinct traces in language and custom.

But if we replace individual marriage, we can then grasp the apparent excess of cases of incest shunning which we have met among these same races. The totem exogamy, or prohibition of sexual intercourse between members of the same clan, seemed the most appropriate means for the prevention of group incest; and this totem exogamy then became fixed and long survived its original motivation.

Although we believe we understand the motives of the marriage restrictions among the Australian savages, we have still to learn that the actual conditions reveal a still more bewildering complication. For there are only few tribes in Australia which show no other prohibition besides the totem barrier. Most of them are so organized that they fall into two divisions which have been called marriage classes, or phratries. Each of these marriage groups is exogamous and includes a majority of totem groups. Usually each marriage group is again divided into two subclasses (subphratries), and the whole tribe is therefore divided into four classes; the subclasses thus standing between the phratries and the totem groups.

The typical and very often intricate scheme of organization of an Australian tribe therefore looks as follows:



The twelve totem groups are brought under four subclasses and two main classes. All the divisions are exogamous. The subclass c forms an exogamous unit with e, and the subclass d with f. The success or the tendency of these arrangements is quite obvious; they serve as a further restriction on the marriage choice and on sexual freedom. If there were only these twelve totem groups — assuming the same number of people in each group — every member of a group would have 11/12 of all the

women of the tribe to choose from. The existence of the two phratries reduces this number to 6/12 or ½; a man of the totem α can only marry a woman from the groups 1 to 6. With the introduction of the two subclassess the selection sinks to 3/12 or ¼; a man of the totem α must limit his marriage choice to a woman of the totems 4, 5, 6.

The historical relations of the marriage classes — of which there are found as many as eight in some tribes — are quite unexplained. We only see that these arrangements seek to attain the same object as the totem exogamy, and even strive for more. But whereas the totem exogamy makes the impression of a sacred statute which sprang into existence, no one knows how, and is therefore a custom, the complicated institutions of the marriage classes, with their sub-divisions and the conditions attached to them, seem to spring from legislation with a definite aim in view. They have perhaps taken up afresh the task of incest prohibition because the influence of the totem was on the wane. And while the totem system is, as we know, the basis of all other social obligations and moral restrictions of the tribe, the importance of the phratries generally ceases when the regulation of the marriage choice at which they aimed has been accomplished.

In the further development of the classification of the marriage system there seems to be a tendency to go beyond the prevention of natural and group incest, and to prohibit marriage between more distant group relations, in a manner similar to the Catholic church, which extended the marriage prohibitions always in force for brother and sisters, to cousins, and invented for them the grades of spiritual kinship.

It would hardly serve our purpose to go into the extraordinarily intricate and unsettled discussion concerning the origin and significance of the marriage classes, or to go more deeply into their relation to totemism. It is sufficient for our purposes to point out the great care expended by the Australians as well as by other savage people to prevent incest. We must say that these savages are even more sensitive to incest than we, perhaps because they are more subject to temptations than we are, and hence require more extensive protection against it.

But the incest dread of these races does not content itself with the creation of the institutions described, which, in the main, seem to be directed against group incest. We must add a series of ‘customs’ which watch over the individual behaviour to near relatives in our sense, which

are maintained with almost religious severity and of whose object there can hardly be any doubt. These customs or custom prohibitions may be called ‘avoidances’. They spread far beyond the Australian totem races. But here again I must ask the reader to be content with a fragmentary excerpt from the abundant material.

Such restrictive prohibitions are directed in Melanesia against the relations of boys with their mothers and sisters. Thus, for instance, on Lepers Island, one of the New Hebrides, the boy leaves his maternal home at a fixed age and moves to the ‘clubhouse’, where he there regularly sleeps and takes his meals. He may still visit his home to ask for food; but if his sister is at home he must go away before he has eaten; if no sister is about he may sit down to eat near the door. If brother and sister meet by chance in the open, she must run away or turn aside and conceal herself. If the boy recognizes certain footprints in the sand as his sister’s he is not to follow them, nor is she to follow his. He will not even mention her name and will guard against using any current word if it forms part of her name. This avoidance, which begins with the ceremony of puberty, is strictly observed for life. The reserve between mother and son increases with age and generally is more obligatory on the mother’s side. If she brings him something to eat she does not give it to him herself but puts it down before him, nor does she address him in the familiar manner of mother and son, but uses the formal address. Similar customs obtain in New Caledonia. If brother and sister meet, she flees into the bush and he passes by without turning his head toward her.

On the Gazella Peninsula in New Britain a sister, beginning with her marriage, may no longer speak with her brother, nor does she utter his name but designates him by means of a circumlocution.

In New Mecklenburg some cousins are subject to such restrictions, which also apply to brothers and sisters. They may neither approach each other, shake hands, nor give each other presents, though they may talk to each other at a distance of several paces. The penalty for incest with a sister is death through hanging.

These rules of avoidance are especially severe in the Fiji Islands where they concern not only consanguineous sisters but group sisters as well.

To hear that these savages hold sacred orgies in which persons of just these forbidden degrees of kinship seek sexual union would seem still

more peculiar to us, if we did not prefer to make use of this contradiction to explain the prohibition instead of being astonished at it.

Among the Battas of Sumatra these laws of avoidance affect all near relationships. For instance, it would be most offensive for a Battan to accompany his own sister to an evening party. A brother will feel most uncomfortable in the company of his sister even when other persons are also present. If either comes into the house, the other prefers to leave. Nor will a father remain alone in the house with his daughter any more than the mother with her son. The Dutch missionary who reported these customs added that unfortunately he had to consider them well founded. It is assumed without question by these races that a man and a woman left alone together will indulge in the most extreme intimacy, and as they expect all kinds of punishments and evil consequences from consanguineous intercourse they do quite right to avoid all temptations by means of such prohibitions.

Among the Barongos in Delagoa Bay, in Africa, the most rigorous precautions are directed, curiously enough, against the sister-in-law, the wife of the brother of one's own wife. If a man meets this person who is so dangerous to him, he carefully avoids her. He does not dare to eat out of the same dish with her; he speaks only timidly to her, does not dare to enter her hut, and greets her only with a trembling voice.

Among the Akamba (or Wakamba) in British East Africa, a law of avoidance is in force which one would have expected to encounter more frequently. A girl must carefully avoid her own father between the time of her puberty and her marriage. She hides herself if she meets him on the street and never attempts to sit down next to him, behaving in this way right up to her engagement. But after her marriage no further obstacle is put in the way of her social intercourse with her father.

The most widespread and strictest avoidance, which is perhaps the most interesting one for civilized races is that which restricts the social relations between a man and his mother-in-law. It is quite general in Australia, but it is also in force among the Melanesian, Polynesian and Negro races of Africa as far as the traces of totemism and group relationship reach, and probably further still. Among some of these races similar prohibitions exist against the harmless social intercourse of a wife with her father-in-law, but these are by far not so constant or so serious. In a few cases both parents-in-law become objects of avoidance.

As we are less interested in the ethnographic dissemination than in the substance and the purpose of the mother-in-law avoidance, I will here also limit myself to a few examples.

On the Banks Island these prohibitions are very severe and painfully exact. A man will avoid the proximity of his mother-in-law as she avoids his. If they meet by chance on a path, the woman steps aside and turns her back until he is passed, or he does the same.

In Vanna Lava (Port Patterson) a man will not even walk behind his mother-in-law along the beach until the rising tide has washed away the trace of her footsteps. But they may talk to each other at a certain distance. It is quite out of the question that he should ever pronounce the name of his mother-in-law, or she his.

On the Solomon Islands, beginning with his marriage, a man must neither see nor speak with his mother-in-law. If he meets her he acts as if he did not know her and runs away as fast as he can in order to hide himself.

Among the Zulu Kaffirs custom demands that a man should be ashamed of his mother-in-law and that he should do everything to avoid her company. He does not enter a hut in which she is, and when they meet he or she goes aside, she perhaps hiding behind a bush while he holds his shield before his face. If they cannot avoid each other and the woman has nothing with which to cover herself, she at least binds a bunch of grass around her head in order to satisfy the ceremonial requirements. Communication between them must either be made through a third person or else they may shout at each other at a considerable distance if they have some barrier between them as, for instance, the enclosure of a kraal. Neither may utter the other’s name.

Among the Basogas, a negro tribe living in the region of the Nile sources, a man may talk to his mother-in-law only if she is in another room of the house and is not visible to him. Moreover, this race abominates incest to such an extent as not to let it go unpunished even among domestic animals.

Whereas all observers have interpreted the purpose and meaning of the avoidances between near relatives as protective measures against incest, different interpretations have been given for those prohibitions which concern the relationship with the mother-in-law. It was quite incomprehensible why all these races should manifest such great fear of

temptation on the part of the man for an elderly woman, old enough to be his mother.

The same objection was also raised against the conception of Fison who called attention to the fact that certain marriage class systems show a gap in that they make marriage between a man and his mother-in-law theoretically not impossible and that a special guarantee was therefore necessary to guard against this possibility.

Sir J. Lubbock, in his book *The Origin of Civilization,* traces back the behaviour of the mother-in-law toward the son-in-law to the former ‘marriage by capture’. “As long as the capture of women actually took place, the indignation of the parents was probably serious enough. When nothing but symbols of this form of marriage survived, the indignation of the parents was also symbolized and this custom continued after its origin had been forgotten.” Crawley has found it easy to show how little this tentative explanation agrees with the details of actual observation.

E. B. Tylor thinks that the treatment of the son-in-law on the part of the mother-in-law is nothing more than a form of ‘cutting’ on the part of the woman’s family. The man counts as a stranger, and this continues until the first child is born. But even if no account is taken of cases in which this last condition does not remove the prohibition, this explanation is subject to the objection that it does not throw any light on the custom dealing with the relation between mother-in-law and son-in-law, thus overlooking the sexual factor, and that it does not take into account the almost sacred loathing which finds expression in the laws of avoidance.

A Zulu woman who was asked about the basis for this prohibition showed great delicacy of feeling in her answer: “It is not right that he should see the breasts which nursed his wife.”

It is known that also among civilized races the relation of son-in-law and mother-in-law belongs to one of the most difficult sides of family organization. Although laws of avoidance no longer exist in the society of the white races of Europe and America, much quarrelling and displeasure would often be avoided if they did exist and did not have to be re-established by individuals. Many a European will see an act of high wisdom in the laws of avoidance which savage races have established to preclude any understanding between two persons who have become so closely related. There is hardly any doubt that there is something in the psychological situation of mother-in-law and son-in-law which furthers

hostilities between them and renders living together difficult. The fact that the witticisms of civilized races show such a preference for this very mother-in-law theme seems to me to point to the fact that the emotional relations between mother-in-law and son-in-law are controlled by components which stand in sharp contrast to each other. I mean that the relation is really ‘ambivalent’, that is, it is composed of conflicting feelings of tenderness and hostility.

A certain part of these feelings is evident. The mother-in-law is unwilling to give up the possession of her daughter; she distrusts the stranger to whom her daughter has been delivered, and shows a tendency to maintain the dominating position, to which she became accustomed at home. On the part of the man, there is the determination not to subject himself any longer to any foreign will, his jealousy of all persons who preceded him in the possession of his wife’s tenderness, and, last but not least, his aversion to being disturbed in his illusion of sexual over-valuation. As a rule such a disturbance emanates for the most part from his mother-in-law who reminds him of her daughter through so many common traits but who lacks all the charm of youth, such as beauty and that psychic spontaneity which makes his wife precious to him.

The knowledge of hidden psychic feelings which psychoanalytic investigation of individuals has given us, makes it possible to add other motives to the above. Where the psycho-sexual needs of the woman are to be satisfied in marriage and family life, there is always the danger of dissatisfaction through the premature termination of the conjugal relation, and the monotony in the wife’s emotional life. The ageing mother protects herself against this by living through the lives of her children, by identifying herself with them and making their emotional experiences her own. Parents are said to remain young with their children, and this is, in fact, one of the most valuable psychic benefits which parents derive from their children. Childlessness thus eliminates one of the best means to endure the necessary resignation imposed upon the individual through marriage. This emotional indentification with the daughter may easily go so far with the mother that she also falls in love with the man her daughter loves, which leads, in extreme cases, to severe forms of neurotic ailments on account of the violent psychic resistance against this emotional predisposition. At all events the tendency to such infatuation is very frequent with the mother-in-law, and either this infatuation itself or the

tendency opposed to it joins the conflict of contending forces in the psyche of the mother-in-law. Very often it is just this harsh and sadistic component of the love emotion which is turned against the son-in-law in order better to suppress the forbidden tender feelings.

The relation of the husband to his mother-in-law is complicated through similar feelings which, however, spring from other sources. The path of object selection has normally led him to his love object through the image of his mother and perhaps of his sister; in consequence of the incest barriers his preference for these two beloved persons of his childhood has been deflected and he is then able to find their image in strange objects. He now sees the mother-in-law taking the place of his own mother and of his sister's mother, and there develops a tendency to return to the primitive selection, against which everything in him resists. His incest dread demands that he should not be reminded of the genealogy of his love selection; the actuality of his mother-in-law, whom he had not known all his life like his mother so that her picture can be preserved unchanged in his unconscious, facilitates this rejection. An added mixture of irritability and animosity in his feelings leads us to suspect that the mother-in-law actually represents an incest temptation for the son-in-law, just as it not infrequently happens that a man falls in love with his subsequent mother-in-law before his inclination is transferred to her daughter.

I see no objection to the assumption that it is just this incestuous factor of the relationship which motivates the avoidance between son-and mother-in-law among savages. Among the explanations for the 'avoidances' which these primitive races observe so strictly, we would therefore give preference to the opinion originally expressed by Fison, who sees nothing in these regulations but a protection against possible incest. This would also hold good for all the other avoidances between those related by blood or by marriage. There is only one difference, namely, in the first case the incest is direct, so that the purpose of the prevention might be conscious; in the other case, which includes the mother-in-law relation, the incest would be a phantasy temptation brought about by unconscious intermediary links.

We have had little opportunity in this exposition to show that the facts of folk-psychology can be seen in a new light through the application of the psychoanalytic point of view, for the incest dread of savages has long been known as such, and is in need of no further interpretation. What we

can add to the further appreciation of incest dread is the statement that it is a subtle infantile trait and is in striking agreement with the psychic life of the neurotic. Psychoanalysis has taught us that the first object selection of the boy is of an incestuous nature and that it is directed to the forbidden objects, the mother and the sister; pyschoanalysis has taught us also the methods through which the maturing individual frees himself from these incestuous attractions. The neurotic, however, regularly presents to us a piece of psychic infantilism; he has either not been able to free himself from the childlike conditions of psychosexuality, or else he has returned to them (inhibited development and regression). Hence the incestuous fixations of the libido still play or again are playing the main rôle in his unconscious psychic life. We have gone so far as to declare that the relation to the parents instigated by incestuous longings is the central complex of the neurosis. This discovery of the significance of incest for the neurosis naturally meets with the most general incredulity on the part of the grown-up, normal man; a similar rejection will also meet the researches of Otto Rank, which show in even larger scope to what extent the incest theme stands in the centre of poetical interest and how it forms the material of poetry in countless variations and distortions. We are forced to believe that such a rejection is above all the product of man's deep aversion to his former incest wishes which have since succumbed to repression. It is therefore of importance to us to be able to show that man's incest wishes, which later are destined to become unconscious, are still felt to be dangerous by savage races who consider them worthy of the most severe defensive measures.

CHAPTER II. TABOO AND THE AMBIVALENCE OF EMOTIONS

1

TABOO is a Polynesian word, the translation of which provides difficulties for us because we no longer possess the idea which it connotes. It was still current with the ancient Romans: their word ‘sacer’ was the same as the taboo of the Polynesians. The ἁγος of the Greeks and the Kodaush of the Hebrews must also have signified the same thing which the Polynesians express through their word taboo and what many races in America, Africa (Madagascar), North and Central Asia express through analogous designations.

For us the meaning of taboo branches off into two opposite directions. On the one hand it means to us sacred, consecrated: but on the other hand it means, uncanny, dangerous, forbidden, and unclean. The opposite for taboo is designated in Polynesian by the word *noa* and signifies something ordinary and generally accessible. Thus something like the concept of reserve inheres in taboo; taboo expresses itself essentially in prohibitions and restrictions. Our combination of ‘holy dread’ would often express the meaning of taboo.

The taboo restrictions are different from religious or moral prohibitions. They are not traced to a commandment of a god but really they themselves impose their own prohibitions; they are differentiated from moral prohibitions by failing to be included in a system which declares abstinences in general to be necessary and gives reasons for this necessity. The taboo prohibitions lack all justification and are of unknown origin. Though incomprehensible to us they are taken as a matter of course by those who are under their dominance.

Wundt calls taboo the oldest unwritten code of law of humanity. It is generally assumed that taboo is older than the gods and goes back to the pre-religious age.

As we are in need of an impartial presentation of the subject of taboo before subjecting it to psychoanalytic consideration I shall now cite an excerpt from the article *Taboo* in the *Encyclopedia Britannica* written by the anthropologist Northcote W. Thomas:

“Properly speaking taboo includes only (a) the sacred (or unclean) character of persons or things, (b) the kind of prohibition which results from this character, and (c) the sanctity (or uncleanliness) which results from a violation of the prohibition. The converse of taboo in Polynesia is ‘noa’ and allied forms which mean ‘general’ or ‘common’ ...

“Various classes of taboo in the wider sense may be distinguished: 1. natural or direct, the result of ‘mana’ mysterious (power) inherent in a person or thing; 2. communicated or indirect, equally the result of ‘mana’ but (*a*) acquired or (*b*) imposed by a priest, chief or other person; 3. intermediate, where both factors are present, as in the appropriation of a wife to her husband. The term taboo is also applied to ritual prohibitions of a different nature; but its use in these senses is better avoided. It might be argued that the term should be extended to embrace cases in which the sanction of the prohibition is the creation of a god or spirit, i.e., to religious interdictions as distinguished from magical, but there is neither automatic action nor contagion in such a case, and a better term for it is religious interdiction.

“The objects of the taboo are many: 1. direct taboos aim at (*a*) protection of important persons — chiefs, priests, etc. — and things against harm; (*b*) safeguarding of the weak — women children and common people generally — from the powerful mana (magical influence) of chiefs and priests; (*c*) providing against the dangers incurred by handling or coming in contact with corpses, by eating certain food, etc.; (*d*) guarding the chief acts of life — births, initiation, marriage and sexual functions — against interference; (*e*) securing human beings against the wrath or power of gods and spirits; (*f*) securing unborn infants and young children who stand in a specially sympathetic relation with their parents, from the consequence of certain actions, and more especially from the communication of qualities supposed to be derived from certain foods. 2. Taboos are imposed in order to secure against thieves the property of an individual, his fields, tools, etc.”

Other parts of the article may be summarized as follows. Originally the punishment for the violation of a taboo was probably left to an inner, automatic arrangement. The violated taboo avenged itself. Wherever the taboo was related to ideas of gods and demons an automatic punishment was expected from the power of the godhead. In other cases, probably as a result of a further development of the idea, society took over the

punishment of the offender, whose action has endangered his companions. Thus man's first systems of punishment are also connected with taboo.

"The violation of a taboo makes the offender himself taboo." The author goes on to say that certain dangers resulting from the violation of a taboo may be exercised through acts of penance and ceremonies of purification.

A peculiar power inherent in persons and ghosts, which can be transmitted from them to inanimate objects is regarded as the source of the taboo. This part of the article reads as follows: "Persons or things which are regarded as taboo may be compared to objects charged with electricity; they are the seat of tremendous power which is transmissible by contact, and may be liberated with destructive effect if the organisms which provoke its discharge are too weak to resist it; the result of a violation of a taboo depends partly on the strength of the magical influence inherent in the taboo object or person, partly on the strength of the opposing mana of the violator of the taboo. Thus, kings and chiefs are possessed of great power, and it is death for their subjects to address them directly; but a minister or other person of greater *mana* than common, can approach them unharmed, and can in turn be approached by their inferiors without risk.... So, too, indirect taboos depend for their strength on the mana of him who opposes them; if it is a chief or a priest, they are more powerful than those imposed by a common person."

The fact that a taboo is transmissible has surely given rise to the effort of removing it through expiatory ceremonies.

The author states that there are permanent and temporary taboos. The former comprise priests and chiefs as well as the dead and everything that has belonged to them. Temporary taboos attach themselves to certain conditions such as menstruation and child-bed, the status of the warrior before and after the expedition, the activities of fishing and of the chase, and similar activities. A general taboo may also be imposed upon a large district like an ecclesiastical interdict, and may then last for years.

If I judge my readers' impressions correctly, I dare say that after hearing all that was said about taboo they are far from knowing what to understand by it and where to store it in their minds. This is surely due to the insufficient information I have given and to the omission of all discussions concerning the relation of taboo to superstition, to belief in the soul, and to religion. On the other hand I fear that a more detailed

description of what is known about taboo would be still more confusing; I can therefore assure the reader that the state of affairs is really far from clear. We may say, however, that we deal with a series of restrictions which these primitive races impose upon themselves; this and that is forbidden without any apparent reason; nor does it occur to them to question this matter, for they subject themselves to these restrictions as a matter of course and are convinced that any transgression will be punished automatically in the most severe manner. There are reliable reports that innocent transgressions of such prohibitions have actually been punished automatically. For instance, the innocent offender who had eaten from a forbidden animal became deeply depressed, expected his death and then actually died. The prohibitions mostly concern matters which are capable of enjoyment such as freedom of movement and unrestrained intercourse; in some cases they appear very ingenious, evidently representing abstinences and renunciations; in other cases their content is quite incomprehensible, they seem to concern themselves with trifles and give the impression of ceremonials. Something like a theory seems to underlie all these prohibitions, it seems as if these prohibitions are necessary because some persons and objects possess a dangerous power which is transmitted by contact with the object so charged, almost like a contagion. The quantity of this dangerous property is also taken into consideration. Some persons or things have more of it than others and the danger is precisely in accordance with the charge. The most peculiar part of it is that any one who has violated such a prohibition assumes the nature of the forbidden object as if he had absorbed the whole dangerous charge. This power is inherent in all persons who are more or less prominent, such as kings, priests and the newly born, in all exceptional physical states such as menstruation, puberty and birth, in everything sinister like illness and death and in everything connected with these conditions by virtue of contagion or dissemination.

However, the term ‘taboo’ includes all persons, localities, objects and temporary conditions which are carriers or sources of this mysterious attribute. The prohibition derived from this attribute is also designated as taboo, and lastly taboo, in the literal sense, includes everything that is sacred, above the ordinary, and at the same time dangerous, unclean and mysterious.

Both this word and the system corresponding to it express a fragment of psychic life which really is not comprehensible to us. And indeed it would seem that no understanding of it could be possible without entering into the study of the belief in spirits and demons which is so characteristic of these low grades of culture.

Now why should we take any interest at all in the riddle of taboo? Not only, I think, because every psychological problem is well worth the effort of investigation for its own sake, but for other reasons as well. It may be surmised that the taboo of Polynesian savages is after all not so remote from us as we were at first inclined to believe; the moral and customary prohibitions which we ourselves obey may have some essential relation to this primitive taboo the explanation of which may in the end throw light upon the dark origin of our own ‘categorical imperative.’

We are therefore inclined to listen with keen expectations when an investigator like W. Wundt gives his interpretation of taboo, especially as he promises to “go back to the very roots of the taboo concepts”.

Wundt states that the idea of taboo “includes all customs which express dread of particular objects connected with cultic ideas or of actions having reference to them”.

On another occasion he says: “In accordance with the general sense of the word we understand by taboo every prohibition laid down in customs or manners or in expressly formulated laws, not to touch an object or to take it for one’s own use, or to make use of certain proscribed words....” Accordingly there would not be a single race or stage of culture which had escaped the injurious effects of taboo.

Wundt then shows why he finds it more practical to study the nature of taboo in the primitive states of Australian savages rather than in the higher culture of the Polynesian races. In the case of the Australians he divides taboo prohibitions into three classes according as they concern animals, persons or other objects. The animal taboo, which consists essentially of the taboo against killing and eating, forms the nucleus of Totemism. The taboo of the second class, which has human beings for its object, is of an essentially different nature. To begin with it is restricted to conditions which bring about an unusual situation in life for the person tabooed. Thus young men at the feast of initiation, women during menstruation and immediately after delivery, newly born children, the deceased and especially the dead, are all taboo. The constantly used property of any

person, such as his clothes, tools and weapons, is permanently taboo for everybody else. In Australia the new name which a youth receives at his initiation into manhood becomes part of his most personal property, it is taboo and must be kept secret. The taboos of the third class, which apply to trees, plants, houses and localities, are more variable and seem only to follow the rule that anything which for any reason arouses dread or is mysterious, becomes subject to taboo.

Wundt himself has to acknowledge that the changes which taboo undergoes in the richer culture of the Polynesians and in the Malayan Archipelago are not very profound. The greater social differentiation of these races manifests itself in the fact that chiefs, kings and priests exercise an especially effective taboo and are themselves exposed to the strongest taboo compulsion.

But the real sources of taboo lie deeper than in the interests of the privileged classes: “They begin where the most primitive and at the same time the most enduring human impulses have their origin, namely, *in the fear of the effect of demonic powers*”. “The taboo, which originally was nothing more than the objectified fear of the demonic power thought to be concealed in the tabooed object, forbids the irritation of this power and demands the placation of the demon whenever the taboo has been knowingly or unknowingly violated.”

The taboo then gradually became an autonomous power which has detached itself from demonism. It becomes the compulsion of custom and tradition and finally of the law. “But the commandment concealed behind taboo prohibitions which differ materially according to place and time, had originally the meaning: Beware of the wrath of the demons.”

Wundt therefore teaches that taboo is the expression and evolution of the belief of primitive races in demonic powers, and that later taboo has dissociated itself from this origin and has remained a power simply because it was one by virtue of a kind of a psychic persistence and in this manner it became the root of our customs and laws. As little as one can object to the first part of this statement I feel, however, that I am only voicing the impression of many of my readers if I call Wundt’s explanation disappointing. Wundt’s explanation is far from going back to the sources of taboo concepts or to their deepest roots. For neither fear nor demons can be accepted in psychology as finalities defying any further deduction. It would be different if demons really existed; but we know

that, like gods, they are only the product of the psychic powers of man; they have been created from and out of something.

Wundt also expresses a number of important though not altogether clear opinions about the double meaning of taboo. According to him the division between *sacred* and *unclean* does not yet exist in the first primitive stages of taboo. For this reason these conceptions entirely lack the significance which they could only acquire later on when they came to be contrasted. The animal, person or place on which there is a taboo is demonic, that is, not sacred, and therefore not yet, in the later sense, unclean. The expression taboo is particularly suitable for this undifferentiated and intermediate meaning of the demonic, in the sense of something which may not be touched, since it emphasizes a characteristic which finally adheres both to what is sacred and to the unclean, namely, the dread of contact. But the fact that this important characteristic is permanently held in common points to the existence of an original agreement here between these two spheres which gave way to a differentiation only as the result of further conditions through which both finally developed into opposites.

The belief associated with the original taboo, according to which a demonic power concealed in the object avenges the touching of it or its forbidden use by bewitching the offender was still an entirely objectified fear. This had not yet separated into the two forms which it assumed at a more developed stage, namely, awe and aversion.

How did this separation come about? According to Wundt, this was done through the transference of taboo prohibitions from the sphere of demons to that of theistic conceptions. The antithesis of sacred and unclean coincides with the succession of two mythological stages the first of which did not entirely disappear when the second was reached but continued in a state of greatly lowered esteem which gradually turned into contempt. It is a general law in mythology that a preceding stage, just because it has been overcome and pushed back by a higher stage, maintains itself next to it in a debased form so that the objects of its veneration become objects of aversion.

Wundt’s further elucidations refer to the relation of taboo to lustration and sacrifice.

He who approaches the problem of taboo from the field of psychoanalysis, which is concerned with the study of the unconscious part of the individual's psychic life, needs but a moment's reflection to realize that these phenomena are by no means foreign to him. He knows people who have individually created such taboo prohibitions for themselves, which they follow as strictly as savages observe the taboos common to their tribe or society. If he were not accustomed to call these individuals 'compulsion neurotics' he would find the term 'taboo disease' quite appropriate for their malady. Psychoanalytic investigation has taught him the clinical etiology and the essential part of the psychological mechanism of this compulsion disease, so that he cannot resist applying what he has learnt there to explain corresponding manifestations in folk psychology.

There is one warning to which we shall have to give heed in making this attempt. The similarity between taboo and compulsion disease may be purely superficial, holding good only for the manifestations of both without extending into their deeper characteristics. Nature loves to use identical forms in the most widely different biological connections, as, for instance, for coral stems and plants and even for certain crystals or for the formation of certain chemical precipitates. It would certainly be both premature and unprofitable to base conclusions relating to inner relationships upon the correspondence of merely mechanical conditions. We shall bear this warning in mind without, however, giving up our intended comparison on account of the possibility of such confusions.

The first and most striking correspondence between the compulsion prohibitions of neurotics and taboo lies in the fact that the origin of these prohibitions is just as unmotivated and enigmatic. They have appeared at some time or other and must now be retained on account of an unconquerable anxiety. An external threat of punishment is superfluous, because an inner certainty (a conscience) exists that violation will be followed by unbearable disaster. The very most that compulsion patients can tell us is the vague premonition that some person of their environment will suffer harm if they should violate the prohibition. Of what the harm is to consist is not known, and this inadequate information is more likely to be obtained during the later discussions of the expiatory and defensive actions than when the prohibitions themselves are being discussed.

As in the case of taboo the nucleus of the neurotic prohibition is the act of touching, whence we derive the name 'touching phobia' or *délire de*

toucher. The prohibition extends not only to direct contact with the body but also to the figurative use of the phrase as ‘to come into contact’ or ‘be in touch with some one or something’. Anything that leads the thoughts to what is prohibited and thus calls forth mental contact is just as much prohibited as immediate bodily contact; this same extension is also found in taboo.

Some prohibitions are easily understood from their purpose but others strike us as incomprehensible, foolish and senseless. We designate such commands as ‘ceremonials’ and we find that taboo customs show the same variations.

Obsessive prohibitions possess an extraordinary capacity for displacement; they make use of almost any form of connection to extend from one object to another and then in turn make this new object ‘impossible’, as one of my patients aptly puts it. This impossibility finally lays an embargo upon the whole world. The compulsion neurotics act as if the ‘impossible’ persons and things were the carriers of a dangerous contagion which is ready to displace itself through contact to all neighbouring things. We have already emphasized the same characteristics of contagion and transference in the description of taboo prohibitions. We also know that any one who has violated a taboo by touching something which is taboo becomes taboo himself, and no one may come into contact with him.

I shall put side by side two examples of transference or, to use a better term, displacement, one from the life of the Maori, and the other from my observation of a woman suffering from a compulsion neurosis:

“For a similar reason a Maori chief would not blow on a fire with his mouth; for his sacred breath would communicate its sanctity to the fire, which would pass it on to the meat in the pot, which would pass it on to the man who ate the meat which was in the pot, which stood on the fire, which was breathed on by the chief; so that the eater, infected by the chiefs breath conveyed through these intermediaries, would surely die”.

My patient demanded that a utensil which her husband had purchased and brought home should be removed lest it make the place where she lives impossible. For she has heard that this object was bought in a store which is situated, let us say, in Stag Street. But as the word ‘stag’ is the name of a friend now in a distant city, whom she has known in her youth under her maiden name and whom she now finds ‘impossible’, that is

taboo, the object bought in Vienna is just as taboo as this friend with whom she does not want to come into contact.

Compulsion prohibitions, like taboo prohibitions, entail the most extraordinary renunciations and restrictions of life, but a part of these can be removed by carrying out certain acts which now also must be done because they have acquired a compulsive character (obsessive acts); there is no doubt that these acts are in the nature of penances, expiations, defence reactions, and purifications. The most common of these obsessive acts is washing with water (washing obsession). A part of the taboo prohibitions can also be replaced in this way, that is to say, their violation can be made good through such a ‘ceremonial’, and here too lustration through water is the preferred way.

Let us now summarize the points in which the correspondence between taboo customs and the symptoms of compulsion neurosis are most clearly manifested: 1. In the lack of motivation of the commandments, 2. in their enforcement through an inner need, 3. in their capacity of displacement and in the danger of contagion from what is prohibited, 4. and in the causation of ceremonial actions and commandments which emanate from the forbidden.

However, psychoanalysis has made us familiar with the clinical history as well as the psychic mechanism of compulsion neurosis. Thus the history of a typical case of touching phobia reads as follows: In the very beginning, during the early period of childhood, the person manifested a strong pleasure in touching himself, the object of which was much more specialized than one would be inclined to suspect. Presently the carrying out of this very pleasurable act of touching was opposed by a prohibition from without. The prohibition was accepted because it was supported by strong inner forces; it proved to be stronger than the impulse which wanted to manifest itself through this act of touching. But due to the primitive psychic constitution of the child this prohibition did not succeed in abolishing the impulse. Its only success lay in repressing the impulse (the pleasure of touching) and banishing it into the unconscious. Both the prohibition and the impulse remained; the impulse because it had only been repressed and not abolished, the prohibition, because if it had ceased the impulse would have broken through into consciousness and would have been carried out. An unsolved situation, a psychic fixation, had thus

been created and now everything else emanated from the continued conflict between prohibition and impulse.

The main characteristic of the psychic constellation which has thus gone under fixation lies in what one might call the ambivalent behaviour of the individual to the object, or rather to an action regarding it. The individual constantly wants to carry out this action (the act of touching), he sees in it the highest pleasure, but he may not carry it out, and he even abominates it. The opposition between these two streams cannot be easily adjusted because — there is no other way to express it — they are so localized in the psychic life that they cannot meet. The prohibition becomes fully conscious, while the surviving pleasure of touching remains unconscious, the person knowing nothing about it. If this psychological factor did not exist the ambivalence could neither maintain itself so long nor lead to such subsequent manifestations.

In the clinical history of the case we have emphasized the appearance of the prohibition in early childhood as the determining factor; but for the further elaboration of the neurosis this rôle is played by the repression which appears at this age. On account of the repression which has taken place, which is connected with forgetting (amnesia), the motivation of the prohibition that has become conscious remains unknown, and all attempts to unravel it intellectually must fail, as the point of attack cannot be found. The prohibition owes its strength — its compulsive character — to its association with its unknown counterpart, the hidden and unabated pleasure, that is to say, to an inner need into which conscious insight is lacking. The transferability and reproductive power of the prohibition reflect a process which harmonizes with the unconscious pleasure and is very much facilitated through the psychological determinants of the unconscious. The pleasure of the impulse constantly undergoes displacement in order to escape the blocking which it encounters and seeks to acquire surrogates for the forbidden in the form of substitutive objects and actions. For the same reason the prohibition also wanders and spreads to the new aims of the proscribed impulse. Every new advance of the repressed libido is answered by the prohibition with a new severity. The mutual inhibition of these two contending forces creates a need for discharge and for lessening the existing tension, in which we may recognize the motivation for the compulsive acts. In the neurosis there are distinctly acts of compromise which on the one hand may be regarded as

proofs of remorse and efforts to expiate and similar actions; but on the other hand they are at the same time substitutive actions which recompense the impulse for what has been forbidden. It is a law of neurotic diseases that these obsessive acts serve the impulse more and more and come nearer and nearer to the original and forbidden act.

We may now make the attempt to study taboo as if it were of the same nature as the compulsive prohibitions of our patients. It must naturally be clearly understood that many of the taboo prohibitions which we shall study are already secondary, displaced and distorted, so that we shall have to be satisfied if we can shed some light upon the earliest and most important taboo prohibitions. We must also remember that the differences in the situation of the savage and of the neurotic may be important enough to exclude complete correspondence and prevent a point by point transfer from one to the other such as would be possible if we were dealing with exact copies.

First of all it must be said that it is useless to question savages as to the real motivation of their prohibitions or as to the genesis of taboo. According to our assumption they must be incapable of telling us anything about it since this motivation is ‘unconscious’ to them. But following the model of the compulsive prohibition we shall construct the history of taboo as follows: Taboos are very ancient prohibitions which at one time were forced upon a generation of primitive people from without, that is, they probably were forcibly impressed upon them by an earlier generation. These prohibitions concerned actions for which there existed a strong desire. The prohibitions maintained themselves from generation to generation, perhaps only as the result of a tradition set up by paternal and social authority. But in later generations they have perhaps already become ‘organized’ as a piece of inherited psychic property. Whether there are such ‘innate ideas’ or whether these have brought about the fixation of the taboo by themselves or by co-operating with education no one could decide in the particular case in question. The persistence of taboo teaches, however, one thing, namely, that the original pleasure to do the forbidden still continues among taboo races. They therefore assume an *ambivalent attitude* toward their taboo prohibitions; in their unconscious they would like nothing better than to transgress them but they are also afraid to do it; they are afraid just because they would like to transgress, and the fear is

stronger than the pleasure. But in every individual of the race the desire for it is unconscious, just as in the neurotic.

The oldest and most important taboo prohibitions are the two basic laws of *totemism*: namely not to kill the totem animal, and to avoid sexual intercourse with totem companions of the other sex.

It would therefore seem that these must have been the oldest and strongest desires of mankind. We cannot understand this and therefore we cannot use these examples to test our assumptions as long as the meaning and the origin of the totemic system is so wholly unknown to us. But the very wording of these taboos and the fact that they occur together will remind any one who knows the results of the psychoanalytic investigation of individuals, of something quite definite which psychoanalysts call the central point of the infantile wish life and the nucleus of the later neurosis.

All other varieties of taboo phenomena which have led to the attempted classifications noted above become unified if we sum them up in the following sentence. The basis of taboo is a forbidden action for which there exists a strong inclination in the unconscious.

We know, without understanding it, that whoever does what is prohibited and violates the taboo, becomes himself taboo. But how can we connect this fact with the other, namely that the taboo adheres not only to persons who have done what is prohibited but also to persons who are in exceptional circumstances, to these circumstances themselves, and to impersonal things? What can this dangerous attribute be which always remains the same under all these different conditions? Only one thing, namely, the propensity to arouse the ambivalence of man and to tempt him to violate the prohibition.

An individual who has violated a taboo becomes himself taboo because he has the dangerous property of tempting others to follow his example. He arouses envy; why should he be allowed to do what is prohibited to others? He is therefore really *contagious*, in so far as every example incites to imitation and therefore he himself must be avoided.

But a person may become permanently or temporarily taboo without having violated any taboos, for the simple reason that he is in a condition which has the property of inciting the forbidden desires of others and of awakening the ambivalent conflict in them. Most of the exceptional positions and conditions have this character and possess this dangerous power. The king or chieftain rouses envy of his prerogatives; everybody

would perhaps like to be king. The dead, the newly born, and women when they are incapacitated all act as incitements on account of their peculiar helplessness, while the individual who has just reached sexual maturity tempts through the promise of a new pleasure. Therefore all these persons and all these conditions are taboo, for one must not yield to the temptations which they offer.

Now, too, we understand why the forces inherent in the ‘mana’ of various persons can neutralize one another so that the mana of one individual can partly cancel that of the other. The taboo of a king is too strong for his subject because the social difference between them is too great. But a minister, for example, can become the harmless mediator between them. Translated from the language of taboo into the language of normal psychology this means: the subject who shrinks from the tremendous temptation which contact with the king creates for him can brook the intercourse of an official, whom he does not have to envy so much and whose position perhaps seems attainable to him. The minister, on his part, can moderate his envy of the king by taking into consideration the power that has been granted to him. Thus smaller differences in the magic power that lead to temptation are less to be feared than exceptionally big differences.

It is equally clear how the violation of certain taboo prohibitions becomes a social danger which must be punished or expiated by all the members of society lest it harm them all. This danger really exists if we substitute the known impulses for the unconscious desires. It consists in the possibility of imitation, as a result of which society would soon be dissolved. If the others did not punish the violation they would perforce become aware that they want to imitate the evil doer.

Though the secret meaning of a taboo prohibition cannot possibly be of so special a nature as in the case of a neurosis, we must not be astonished to find that touching plays a similar rôle in taboo prohibition as in the *délire de toucher*. To touch is the beginning of every act of possession, of every attempt to make use of a person or thing.

We have interpreted the power of contagion which inheres in the taboo as the property of leading into temptation, and of inciting to imitation. This does not seem to be in accord with the fact that the contagiousness of the taboo is above all manifested in the transference to objects which thus themselves become carriers of the taboo.

This transferability of the taboo reflects what is found in the neurosis, namely, the constant tendency of the unconscious impulse to become displaced through associative channels upon new objects. Our attention is thus drawn to the fact that the dangerous magic power of the ‘mana’ corresponds to two real faculties, the capacity of reminding man of his forbidden wishes, and the apparently more important one of tempting him to violate the prohibition in the service of these wishes. Both functions reunite into one, however, if we assume it to be in accord with a primitive psychic life that with the awakening of a memory of a forbidden action there should also be combined the awakening of the tendency to carry out the action. Memory and temptation then again coincide. We must also admit that if the example of a person who has violated a prohibition leads another to the same action, the disobedience of the prohibition has been transmitted like a contagion, just as the taboo is transferred from a person to an object, and from this to another.

If the violation of a taboo can be condoned through expiation or penance, which means, of course, a *renunciation* of a possession or a liberty, we have the proof that the observance of a taboo regulation was itself a renunciation of something really wished for. The omission of one renunciation is cancelled through a renunciation at some other point. This would lead us to conclude that, as far as taboo ceremonials are concerned, penance is more primitive than purification.

Let us now summarize what understanding we have gained of taboo through its comparison with the compulsive prohibition of the neurotic. Taboo is a very primitive prohibition imposed from without (by an authority) and directed against the strongest desires of man. The desire to violate it continues in the unconscious; persons who obey the taboo have an ambivalent feeling toward what is affected by the taboo. The magic power attributed to taboo goes back to its ability to lead man into temptation; it behaves like a contagion, because the example is contagious, and because the prohibited desire becomes displacing in the unconscious upon something else. The expiation for the violation of a taboo through a renunciation proves that a renunciation is at the basis of the observance of the taboo.

We may ask what we have gained from the comparison of taboo with compulsion neurosis and what value can be claimed for the interpretation we have given on the basis of this comparison? Our intrepretation is evidently of no value unless it affords an advantage not to be had in any other way and unless it affords a better understanding of taboo than was otherwise possible. We might claim that we have already given proof of its usefulness in what has been said above; but we shall have to try to strengthen our proof by continuing the explanation of taboo prohibitions and customs in detail.

But we can avail ourselves of another method. We can shape our investigation so as to ascertain whether a part of the assumptions which we have transferred from the neurosis to the taboo, or the conclusions at which we have thereby arrived can be demonstrated directly in the phenomena of taboo. We must decide, however, what we want to look for. The assertion concerning the genesis of taboo, namely, that it was derived from a primitive prohibition which was once imposed from without, cannot, of course, be proved. We shall therefore seek to confirm those psychological conditions for taboo with which we have become acquainted in the case of compulsion neurosis. How did we gain our knowledge of these psychological factors in the case of neurosis? Through the analytical study of the symptoms, especially the compulsive actions, the defence reactions and the obsessive commands. These mechanisms gave every indication of having been derived from *ambivalent* impulses or tendencies, they either represented simultaneously the wish and counter-wish or they served preponderantly one of the two contrary tendencies. If we should now succeed in showing that ambivalence, i.e., the sway of contrary tendencies, exists also in the case of taboo regulations or if we should find among taboo mechanisms some which like neurotic obsessions give simultaneous expression to both currents, we would have established what is practically the most important point in the psychological correspondence between taboo and compulsion neurosis.

We have already mentioned that the two fundamental taboo prohibitions are inaccessible to our analysis because they belong to totemism; another part of the taboo rules is of secondary origin and cannot be used for our purpose. For among these races taboo has become the general form of law giving and has helped to promote social tendencies which are certainly younger; than taboo itself, as for instance, the taboos

imposed by chiefs and priests to insure their property and privileges. But there still remains a large group of laws which we may undertake to investigate. Among these I lay stress on those taboos which are attached (*a*) to enemies, (*b*) to chiefs, and (*c*) to the dead; the material for our investigation is taken from the excellent collection of J. G. Frazer in his great work, *The Golden Bough*.

(*A*) THE TREATMENT OF ENEMIES

Inclined as we may have been to ascribe to savage and semi-savage races uninhibited and remorseless cruelty towards their enemies, it is of great interest to us to learn that with them, too, the killing of a person compels the observation of a series of rules which are associated with taboo customs. These rules are easily brought under four groups; they demand 1. reconciliation with the slain enemy, 2. restrictions, 3. acts of expiation, and purifications of the manslayer, and 4. certain ceremonial rites. The incomplete reports do not allow us to decide with certainty how general or how isolated such taboo customs may be among these races, but this is a matter of indifference as far as our interest in these occurrences is concerned. Still, it may be assumed that we are dealing with widespread customs and not with isolated peculiarities.

The reconciliation customs practised on the island of Timor, after a victorious band of warriors has returned with the severed heads of the vanquished enemy, are especially significant because the leader of the expedition is subject to heavy additional restrictions. “At the solemn entry of the victors, sacrifices are made to conciliate the souls of the enemy; otherwise one would have to expect harm to come to the victors. A dance is given and a song is sung in which the slain enemy is mourned and his forgiveness is implored: ‘Be not angry’, they say ‘because your head is here with us; had we been less lucky, our heads might have been exposed in your village. We have offered the sacrifice to appease you. Your spirit may now rest and leave us at peace. Why were you our enemy? Would it not have been better that we should remain friends? Then your blood would not have been spilt and your head would not have been cut off’”.

Similar customs are found among the Palu in Celebes; the Gallas sacrifice to the spirits of their dead enemies before they return to their home villages.

Other races have found methods of making friends, guardians and protectors out of their former enemies after they are dead. This consists in

the tender treatment of the severed heads, of which many wild tribes of Borneo boast. When the See-Dayaks of Sarawak bring home a head from a war expedition, they treat it for months with the greatest kindness and courtesy and address it with the most endearing names in their language. The best morsels from their meals are put into its mouth, together with titbits and cigars. The dead enemy is repeatedly entreated to hate his former friends and to bestow his love upon his new hosts because he has now become one of them. It would be a great mistake to think that any derision is attached to this treatment, horrible though it may seem to us.

Observers have been struck by the mourning for the enemy after he is slain and scalped, among several of the wild tribe of North America. When a Choctaw had killed an enemy he began a month's mourning during which he submitted himself to serious restrictions. The Dakota Indians mourned in the same way. One authority mentions that the Osaga Indians after mourning for their own dead mourned for their foes as if they had been friends.

Before proceeding to the other classes of taboo customs for the treatment of enemies, we must define our position in regard to a pertinent objection. Both Frazer as well as other authorities may well be quoted against us to show that the motive for these rules of reconciliation is quite simple and has nothing to do with 'ambivalence.' These races are dominated by a superstitious fear of the spirits of the slain, a fear which was also familiar to classical antiquity, and which the great British dramatist brought upon the stage in the hallucinations of Macbeth and Richard the Third. From this superstition all the reconciliation rules as well as the restrictions and expiations which we shall discuss later can be logically deduced; moreover, the ceremonies included in the fourth group also argue for this interpretation, since the only explanation of which they admit is the effort to drive away the spirits of the slain which pursue the manslayers. Besides, the savages themselves directly admit their fear for the spirits of their slain foes and trace back the taboo customs under discussion to this fear.

This objection is certainly pertinent and if it were adequate as well we would gladly spare ourselves the trouble of our attempt to find a further explanation. We postpone the consideration of this objection until later and for the present merely contrast it to the interpretation derived from our previous discussion of taboo. All these rules of taboo lead us to

conclude that other impulses besides those that are merely hostile find expression in the behaviour towards enemies. We see in them manifestations of repentance, of regard for the enemy, and of a bad conscience for having slain him. It seems that the commandment, Thou shalt not slay, which could not be violated without punishment, existed also among these savages, long before any legislation was received from the hands of a god.

We now return to the remaining classes of taboo rules. The *restrictions* laid upon the victorious manslayer are unusually frequent and are mostly of a serious nature. In Timor (compare the reconciliation customs mentioned above) the leader of the expedition cannot return to his house under any circumstances. A special hut is erected for him in which he spends two months engaged in the observance of various rules of purification. During this period he may not see his wife or nourish himself; another person must put his food in his mouth. Among some Dayak tribes warriors returning from a successful expedition must remain sequestered for several days and abstain from certain foods; they may not touch iron and must remain away from their wives. In Logea, an island near New Guinea, men who have killed an enemy or have taken part in the killing, lock themselves up in their houses for a week. They avoid every intercourse with their wives and friends, they do not touch their victuals with their hands and live on nothing but vegetable foods which are cooked for them in special dishes. As a reason for this last restriction it is alleged that they must smell the blood of the slain, otherwise they would sicken and die. Among the Toaripi-or Motumotu-tribes in New Guinea a manslayer must not approach his wife and must not touch his food with his fingers. A second person must feed him with special food. This continues until the next new moon.

I avoid the complete enumeration of all the cases of restrictions of the victorious slayer mentioned by Frazer, and emphasize only such cases in which the character of taboo is especially noticeable or where the restriction appears in connection with expiation, purification and ceremonial.

Among the Monumbos in German New Guinea a man who has killed an enemy in combat becomes ‘unclean’, the same word being employed which is applied to women during menstruation or confinement. For a considerable period he is not allowed to leave the men’s club-house, while

the inhabitants of his village gather about him and celebrate his victory with songs and dances. He must not touch any one, not even his wife and children; if he did so they would be afflicted with boils. He finally becomes clean through washing and other ceremonies.

Among the Natchez in North America young warriors who had procured their first scalp were bound for six months to the observance of certain renunciations. They were not allowed to sleep with their wives or to eat meat, and received only fish and maize pudding as nourishment. When a Choctaw had killed and scalped an enemy he began a period of mourning for one month, during which he was not allowed to comb his hair. When his head itched he was not allowed to scratch it with his hand but used a small stick for this purpose.

After a Pima Indian had killed an Apache he had to submit himself to severe ceremonies of purification and expiation. During a fasting period of sixteen days he was not allowed to touch meat or salt, to look at a fire or to speak to any one. He lived alone in the woods, where he was waited upon by an old woman who brought him a small allowance of food; he often bathed in the nearest river, and carried a lump of clay on his head as a sign of mourning. On the seventeenth day there took place a public ceremony through which he and his weapons were solemnly purified. As the Pima Indians took the manslayer taboo much more seriously than their enemies and, unlike them, did not postpone expiation and purification until the end of the expedition, their prowess in war suffered very much through their moral severity or what might be called their piety. In spite of their extraordinary bravery they proved to be unsatisfactory allies to the Americans in their wars against the Apaches.

The detail and variations of these expiatory and purifying ceremonies after the killing of an enemy would be most interesting for purposes of a more searching study, but I need not enumerate any more of them here because they cannot furnish us with any new points of view. I might mention that the temporary or permanent isolation of the professional executioner, which was maintained up to our time, is a case in point. The position of the ‘free-holder’ in mediæval society really conveys a good idea of the ‘taboo’ of savages.

The current explanation of all these rules of reconciliation, restriction, expiation and purification, combines two principles, namely, the extension of the taboo of the dead to everything that has come into contact with him,

and the fear of the spirit of the slain. In what combination these two elements are to explain the ceremonial, whether they are to be considered as of equal value or whether one of them is primary and the other secondary, and which one, is nowhere stated, nor would this be an easy matter to decide. In contradistinction to all this we emphasize the unity which our interpretation gains by deducing all these rules from the ambivalence of the emotion of savages towards their enemies.

(B) THE TABOO OF RULERS

The behaviour of primitive races towards their chiefs, kings, and priests, is controlled by two principles which seem rather to supplement than to contradict each other. They must both be guarded and be guarded against.

Both objects are accomplished through innumerable rules of taboo. Why one must guard against rulers is already known to us; because they are the bearers of that mysterious and dangerous magic power which communicates itself by contact, like an electric charge, bringing death and destruction to any one not protected by a similar charge. All direct or indirect contact with this dangerous sacredness is therefore avoided, and where it cannot be avoided a ceremonial has been found to ward off the dreaded consequences. The Nubas in East Africa, for instance, believe that they must die if they enter the house of their priest-king, but that they escape this danger if, on entering, they bare the left shoulder and induce the king to touch it with his hand. Thus we have the remarkable case of the king's touch becoming the healing and protective measure against the very dangers that arise from contact with the king; but it is probably a question of the healing power of the intentional touching on the king's part in contradistinction to the danger of touching him, in other words, of the opposition between passivity and activity towards the king.

Where the healing power of the royal touch is concerned we do not have to look for examples among savages. In comparatively recent times the kings of England exercised this power upon scrofula, whence it was called 'The King's Evil'. Neither Queen Elizabeth nor any of her successors renounced this part of the royal prerogative. Charles I is said to have healed a hundred sufferers at one time, in the year 1633. Under his dissolute son Charles II, after the great English revolution had passed, royal healings of scrofula attained their greatest vogue.

This king is said to have touched close to a hundred thousand victims of scrofula in the course of his reign. The crush of those seeking to be cured used to be so great that on one occasion six or seven patients suffered death by suffocation instead of being healed. The sceptical king of Orange, William III, who became king of England after the banishment of the Stuarts, refused to exercise the spell; on the one occasion when he

consented to practise the touch, he did so with words: “May God give you better health and more sense”.

The following account will bear witness to the terrible effect of touching by virtue of which a person, even though unintentionally, becomes active against his king or against what belongs to him. A chief of high rank and great holiness in New Zealand happened to leave the remains of his meal by the roadside. A young slave came along, a strong healthy fellow, who saw what was left over and started to eat it. Hardly had he finished when a horrified spectator informed him of his offence in eating the meal of the chief. The man had been a strong, brave warrior, but as soon as he heard this he collapsed and was afflicted by terrible convulsions, from which he died towards sunset of the following day. A Maori woman ate a certain fruit and then learned that it came from a place on which there was a taboo. She cried out that the spirit of the chief whom she had thus offended would surely kill her. This incident occurred in the afternoon, and on the next day at twelve o’clock she was dead. The tinder box of a Maori chief once cost several persons their lives. The chief had lost it, and those who found it used it to light their pipes. When they learned whose property the tinder box was they all died of fright.

It is hardly astonishing that the need was felt to isolate dangerous persons like chiefs and priests, by building a wall around them which made them inaccessible to others. We surmise that this wall, which originally was constructed out of taboo rules, still exists to-day in the form of court ceremony.

But probably the greater part of this taboo of the rulers cannot be traced back to the need of guarding against them. The other point of view in the treatment of privileged persons, the need of guarding them from dangers with which they are threatened, has had a distinct share in the creation of taboo and therefore of the origin of court etiquette.

The necessity of guarding the king from every conceivable danger arises from his great importance for the weal and woe of his subjects. Strictly speaking, he is a person who regulates the course of the world; his people have to thank him not only for rain and sunshine, which allow the fruits of the earth to grow, but also for the wind which brings the ships to their shores and for the solid ground on which they set their feet.

These savage kings are endowed with a wealth of power and an ability to bestow happiness which only gods possess; certainly in later stages of

civilization none but the most servile courtiers would play the hypocrite to the extent of crediting their sovereigns with the possession of attributes similar to these.

It seems like an obvious contradiction that persons of such perfection of power should themselves require the greatest care to guard them against threatening dangers, but this is not the only contradiction revealed in the treatment of royal persons on the part of savages. These races consider it necessary to watch over their kings to see that they use their powers in the right way; they are by no means sure of their good intentions or of their conscientiousness. A strain of mistrust is mingled with the motivation of the taboo rules for the king. “The idea that early kingdoms are despotisms”, says Frazer, “in which the people exist only for the sovereign, is wholly inapplicable to the monarchies we are considering. On the contrary, the sovereign in them exists only for his subjects: his life is only valuable so long as he discharges the duties of his position by ordering the course of nature for his people’s benefit. So soon as he fails to do so, the care, the devotion, the religious homage which they had hitherto lavished on him cease and are changed into hatred and contempt; he is ignominiously dismissed and may be thankful if he escapes with his life. Worshipped as a god one day, he is killed as a criminal the next. But in this changed behaviour of the people there is nothing capricious or inconsistent. On the contrary, their conduct is quite consistent. If their king is their god he is or should be, also their preserver; and if he will not preserve them he must make room for another who will. So long, however, as he answers their expectations, there is no limit to the care which they take of him, and which they compel him to take of himself. A king of this sort lives hedged in by ceremonious etiquette, a network of prohibitions and observances, of which the intention is not to contribute to his dignity, much less to his comfort, but to restrain him from conduct which, by disturbing the harmony of nature, might involve himself, his people, and the universe in one common catastrophe. Far from adding to his comfort, these observances, by trammelling his every act, annihilate his freedom and often render the very life, which it is their object to preserve, a burden and sorrow to him.”

One of the most glaring examples of thus fettering and paralysing a holy ruler through taboo ceremonial seems to have been reached in the life routine of the Mikado of Japan, as it existed in earlier centuries. A

description which is now over two hundred years old relates: “He thinks that it would be very prejudicial to his dignity and holiness to touch the ground with his feet; for this reason when he intends to go anywhere, he must be carried thither on men’s shoulders. Much less will they suffer that he should expose his sacred person to the open air, and the sun is not thought worthy to shine on his head. There is such a holiness ascribed to all the parts of his body that he dares to cut off neither his hair, nor his beard, nor his nails. However, lest he should grow too dirty, they may clean him in the night when he is asleep; because they say that what is taken from his body at that time, hath been stolen from him, and that such a theft does not prejudice his holiness or dignity. In ancient times, he was obliged to sit on the throne for some hours every morning, with the imperial crown on his head; but to sit altogether like a statue without stirring either hands or feet, head or eyes, nor indeed any part of his body, because by this means it was thought that he could preserve peace and tranquillity in his empire; for if unfortunately, he turned himself on one side or other, or if he looked a good while towards any part of his dominion, it was apprehended that war, famine, fire or some other great misfortune was near at hand to desolate the country.”

Some of the taboos to which barbarian kings are subject vividly recall the restrictions placed on murderers. On Shark Point at Cape Padron in Lower Guinea (West Africa), a priest-king called Kukulu lives alone in a woods. He is not allowed to touch a woman or to leave his house and cannot even rise out of his chair, in which he must sleep in a sitting position. If he should lie down the wind would cease and shipping would be disturbed. It is his function to keep storms in check, and in general, to see to an even, healthy condition of the atmosphere. The more powerful a king of Loango is, says Bastian, the more taboos he must observe. The heir to the throne is also bound to them from childhood on; they accumulate about him while he is growing up, and by the time of his accession he is suffocated by them.

Our interest in the matter does not require us to take up more space to describe more fully the taboos that cling to royal and priestly dignity. We merely add that restrictions as to freedom of movement and diet play the main rôle among them. But two examples of taboo ceremonial taken from civilized nations, and therefore from much higher stages of culture, will

indicate to what an extent association with these privileged persons tends to preserve ancient customs.

The Flamen *Dialis*, the high-priest of Jupiter in Rome, had to observe an extraordinarily large number of taboo rules. He was not allowed to ride, to see a horse or an armed man, to wear a ring that was not broken, to have a knot in his garments, to touch wheat flour or leaven, or even to mention by name a goat, a dog, raw meat, beans and ivy; his hair could only be cut by a free man and with a bronze knife, his hair combings and nail parings had to be buried under a lucky tree; he could not touch the dead, go into the open with bare head, and similar prohibitions. His wife, the Flaminica, also had her own prohibitions: she was not allowed to ascend more than three steps on a certain kind of stairs and on certain holidays she could not comb her hair; the leather for her shoes could not be taken from any animal that had died a natural death but only from one that had been slaughtered or sacrificed; when she heard thunder she was unclean until she had made an expiatory sacrifice.

The old kings of Ireland were subject to a series of very curious restrictions, the observance of which was expected to bring every blessing to the country while their violation entailed every form of evil. The complete description of these taboos is given in the *Book of Rights*, of which the oldest manuscript copies bear the dates 1890 and 1418. The prohibitions are very detailed and concern certain activities at specified places and times; in some cities, for instance, the king cannot stay on a certain day of the week, while at some specified hour this or that river may not be crossed, or again there is a plane on which he cannot camp a full nine days, etc.

Among many savage races the severity of the taboo restrictions for the priest-kings has had results of historic importance which are especially interesting from our point of view. The honour of being a priest-king ceased to be desirable; the person in line for the succession often used every means to escape it. Thus in Combodscha, where there is a fire and water king, it is often necessary to use force to compel the successor to accept the honour. On Niue or Savage Island, a coral island in the Pacific Ocean, monarchy actually came to an end because nobody was willing to undertake the responsible and dangerous office. In some parts of West Africa a general council is held after the death of the king to determine upon the successor. The man on whom the choice falls is seized, tied and

kept in custody in the fetish house until he has declared himself willing to accept the crown. Sometimes the presumptive successor to the throne finds ways and means to avoid the intended honour; thus it is related of a certain chief that he used to go armed day and night and resist by force every attempt to place him on the throne. Among the negroes of Sierra Leone the resistance against accepting the kingly honour was so great that most of the tribes were compelled to make strangers their kings.

Frazer makes these conditions responsible for the fact that in the development of history a separation of the original priest-kingship into a spiritual and a secular power finally took place. Kings, crushed by the burden of their holiness, became incapable of exercising their power over real things and had to leave this to inferior but executive persons who were willing to renounce the honours of royal dignity. From these there grew up the secular rulers, while the spiritual over-lordship, which was now of no practical importance, was left to the former taboo kings. It is well known to what extent this hypothesis finds confirmation in the history of old Japan.

A survey of the picture of the relations of primitive peoples to their rulers gives rise to the expectation that our advance from description to psychoanalytic understanding will not be difficult. These relations are of an involved nature and are not free from contradictions. Rulers are granted great privileges which are practically cancelled by taboo prohibitions in regard to other privileges. They are privileged persons, they can do or enjoy what is withheld from the rest through taboo. But in contrast to this freedom they are restricted by other taboos which do not affect the ordinary individual. Here, therefore, is the first contrast, which amounts almost to a contradiction, between an excess of freedom and an excess of restriction as applied to the same persons. They are credited with extraordinary magic powers, and contact with their person or their property is therefore feared, while on the other hand the most beneficial effect is expected from these contacts. This seems to be a second and an especially glaring contradiction; but we have already learned that it is only apparent. The king’s touch, exercised by him with benevolent intention, heals and protects; it is only when a common man touches the king or his royal effects that the contact becomes dangerous, and this is probably because the act may recall aggressive tendencies. Another contradiction which is not so easily solved is expressed in the fact that great power over

the processes of nature is ascribed to the ruler and yet the obligation is felt to guard him with especial care against threatening dangers, as if his own power, which can do so much, were incapable of accomplishing this. A further difficulty in the relation arises because there is no confidence that the ruler will use his tremendous power to the advantage of his subjects as well as for his own protection; he is therefore distrusted and surveillance over him is considered to be justified. The taboo etiquette, to which the life of the king is subject, simultaneously serves all these objects of exercising a tutelage over the king, of guarding him against dangers and of guarding his subjects against danger which he brings to them.

We are inclined to give the following explanation of the complicated and contradictory relation of the primitive peoples to their rulers. Through superstition as well as through other motives, various tendencies find expression in the treatment of kings, each of which is developed to the extreme without regard to the other. As a result of this, contradictions arise at which the intellect of savages takes no more offence than a highly civilized person would as long as it is only a question of religious matters or of ‘loyalty’.

That would be so far so good; but the psychoanalytic technique may enable us to penetrate more deeply into the matter and to add something about the nature of these various tendencies. If we subject the facts as stated to analysis, just as if they formed the symptoms of a neurosis, our first attention would be directed to the excess of anxious worry which is said to be the cause of the taboo ceremonial. The occurrence of such excessive tenderness is very common in the neurosis and especially in the compulsion neurosis upon which we are drawing primarily for our comparison. We now thoroughly understand the origin of this tenderness. It occurs wherever, besides the predominant tenderness, there exists a contrary but unconscious stream of hostility, that is to say, wherever the typical case of an ambivalent affective attitude is realized. The hostility is then cried down by an excessive increase of tenderness which is expressed as anxiety and becomes compulsive because otherwise it would not suffice for its task of keeping the unconscious opposition in a state of repression. Every psychoanalyst knows how infallibly this anxious excess of tenderness can be resolved even under the most improbable circumstances, as for instance, when it appears between mother and child, or in the case of affectionate married people. Applied to the treatment of privileged persons

this theory of an ambivalent feeling would reveal that their veneration, their very deification, is opposed in the unconscious by an intense hostile tendency, so that, as we had expected, the situation of an ambivalent feeling is here realized. The distrust which certainly seems to contribute to the motivation of the royal taboo, would be another direct manifestation of the same unconscious hostility. Indeed the ultimate issues of this conflict show such a diversity among different races that we would not be at a loss for examples in which the proof of such hostility would be much easier. We learn from Frazer that the savage Timmes of Sierra Leone reserve the right to administer a beating to their elected king on the evening before his coronation, and that they make use of this constitutional right with such thoroughness that the unhappy ruler sometimes does not long survive his accession to the throne; for this reason the leaders of the race have made it a rule to elect some man against whom they have a particular grudge. Nevertheless, even in such glaring cases the hostility is not acknowledged as such, but is expressed as if it were a ceremonial.

Another trait in the attitude of primitive races towards their rulers recalls a mechanism which is universally present in mental disturbances, and is openly revealed in the so-called delusions of persecution. Here the importance of a particular person is extraordinarily heightened and his omnipotence is raised to the improbable in order to make it easier to attribute to him the responsibility for everything painful which happens to the patient. Savages really do not act differently towards their rulers when they ascribe to them power over rain and shine, wind and weather, and then dethrone or kill them because nature has disappointed their expectation of a good hunt or a ripe harvest. The prototype which the paranoiac reconstructs in his persecution mania, is found in the relation of the child to its father. Such omnipotence is regularly attributed to the father in the imagination of the son, and distrust of the father has been shown to be intimately connected with the highest esteem for him. When a paranoiac names a person of his acquaintance as his ‘persecutor’, he thereby elevates him to the paternal succession and brings him under conditions which enable him to make him responsible for all the misfortune which he experiences. Thus this second analogy between the savage and the neurotic may allow us to surmise how much in the relation of the savage to his ruler arises from the infantile attitude of the child to its father.

But the strongest support for our point of view, which seeks to compare taboo prohibitions with neurotic symptoms, is to be found in the taboo ceremonial itself, the significance of which for the status of kinship has already been the subject of our previous discussion. This ceremonial unmistakably reveals its double meaning and its origin from ambivalent tendencies if only we are willing to assume that the effects it produces are those which it intended from the very beginning. It not only distinguishes kings and elevates them above all ordinary mortals, but it also makes their life a torture and an unbearable burden and forces them into a thraldom which is far worse than that of their subjects. It would thus be the correct counterpart to the compulsive action of the neurosis, in which the suppressed impulse and the impulse which suppresses it meet in mutual and simultaneous satisfaction. The compulsive action is nominally a protection against the forbidden action; but we would say that actually it is a repetition of what is forbidden. The word ‘nominally’ is here applied to the conscious whereas the word ‘actually’ applies to the unconscious instance of the psychic life. Thus also the taboo ceremonial of kings is nominally an expression of the highest veneration and a means of guarding them; actually it is the punishment for their elevation, the revenge which their subjects take upon them. The experiences which Cervantes makes Sancho Panza undergo as governor on his island have evidently made him recognize this interpretation of courtly ceremonial as the only correct one. It is very possible that this point would be corroborated if we could induce kings and rulers of to-day to express themselves on this point.

Why the emotional attitude towards rulers should contain such a strong unconscious share of hostility is a very interesting problem which, however, exceeds the scope of this book. We have already referred to the infantile father-complex; we may add that an investigation of the early history of kingship would bring the decisive explanations. Frazer has an impressive discussion of the theory that the first kings were strangers who, after a short reign, were destined to be sacrificed at solemn festivals as representatives of the deity; but Frazer himself does not consider his facts altogether convincing. Christian myths are said to have been still influenced by the after-effects of this evolution of kings.

(C) THE TABOO OF THE DEAD

We know that the dead are mighty rulers: we may be surprised to learn that they are regarded as enemies.

Among most primitive people the taboo of the dead displays, if we may keep to our infection analogy, a peculiar virulence. It manifests itself in the first place, in the consequences which result from contact with the dead, and in the treatment of the mourners for the dead. Among the Maori any one who had touched a corpse or who had taken part in its interment, became extremely unclean and was almost cut off from intercourse with his fellow beings; he was, as we say, boycotted. He could not enter a house, or approach persons or objects without infecting them with the same properties. He could not even touch his food with his own hands, which were now unclean and therefore quite useless to him. His food was put on the ground and he had no alternative except to seize it as best he could, with his lips and teeth, while he held his hands behind on his back. Occasionally he could be fed by another person who helped him to his food with outstretched arms so as not to touch the unfortunate one himself, but this assistant was then in turn subjected to almost equally oppressive restrictions. Almost every village contained some altogether disreputable individual, ostracized by society, whose wretched existence depended upon people's charity. This creature alone was allowed within arm's length of a person who had fulfilled the last duty towards the deceased. But as soon as the period of segregation was over and the person rendered unclean through the corpse could again mingle with his fellow-beings, all the dishes which he had used during the dangerous period were broken and all his clothing was thrown away.

The taboo customs after bodily contact with the dead are the same all over Polynesia, in Melanesia, and in a part of Africa; their most constant feature is the prohibition against handling one's food and the consequent necessity of being fed by somebody else. It is noteworthy that in Polynesia, or perhaps only in Hawaii, priest-kings were subject to the same restrictions during the exercise of holy functons. In the taboo of the dead on the Island of Tonga the abatement and gradual abolition of the prohibitions through the individual's own taboo power are clearly shown. A person who touched the corpse of a dead chieftain was unclean for ten

months; but if he was himself a chief, he was unclean for only three, four, or five months, according to the rank of the deceased; if it was the corpse of the idolized head-chief even the greatest chiefs became taboo for ten months. These savages are so certain that any one who violates these taboo rules must become seriously ill and die, that according to the opinion of an observer, they have never yet dared to convince themselves of the contrary.

The taboo restrictions imposed upon persons whose contact with the dead is to be understood in the transferred sense, namely the mourning relatives such as widows and widowers, are essentially the same as those mentioned above, but they are of greater interest for the point we are trying to make. In the rules hitherto mentioned we see only the typical expression of the virulence and power of diffusion of the taboo; in those about to be cited we catch a gleam of the motives, including both the ostensible ones and those which may be regarded as the underlying and genuine motives.

Among the Shuswap in British-Columbia widows and widowers have to remain segregated during their period of mourning; they must not use their hands to touch the body or the head and all utensils used by them must not be used by any one else. No hunter will want to approach the hut in which such mourners live, for that would bring misfortune; if the shadow of one of the mourners should fall on him he would become ill. The mourners sleep on thorn bushes, with which they also surround their beds. This last precaution is meant to keep off the spirit of the deceased; plainer still is the reported custom of other North American tribes where the widow, after the death of her husband, has to wear a kind of trousers of dried grass in order to make herself inaccessible to the approach of the spirit. Thus it is quite obvious that touching ‘in the transferred sense’ is after all understood only as bodily contact, since the spirit of the deceased does not leave his kin and does not desist from ‘hovering about them’, during the period of mourning.

Among the Agutainos, who live on Palawan, one of the Philippine Islands, a widow may not leave her hut for the first seven or eight days after her husband’s death, except at night, when she need not expect encounters. Whoever sees her is in danger of immediate death and therefore she herself warns others of her approach by hitting the trees with a wooden stick with every step she takes; these trees all wither. Another

observation explains the nature of the danger inherent in a widow. In the district of Mekeo, British New Guinea, a widower forfeits all civil rights and lives like an outlaw. He may not tend a garden, or show himself in public, or enter the village or go on the street. He slinks about like an animal, in the high grass or in the bushes, and must hide in a thicket if he sees anybody, especially a woman, approaching. This last hint makes it easy for us to trace back the danger of the widower or widow to the danger of temptation. The husband who has lost his wife must evade the desire for a substitute; the widow has to contend with the same wish, and beside this, she may arouse the desire of other men because she is without a master. Every such satisfaction through a substitute runs contrary to the intention of mourning and would cause the anger of the spirit to flare up.

One of the most surprising, but at the same time one of the most instructive taboo customs of mourning among primitive races is the prohibition against pronouncing the *name* of the deceased. This is very widespread, and has been subjected to many modifications with important consequences.

Aside from the Australians and the Polynesians, who usually show us taboo customs in their best state of preservation, we also find this prohibition among races so far apart and unrelated to each other as the Samojedes in Siberia and the Todas in South India, the Mongolians of Tartary and the Tuaregs of the Sahara, the Aino of Japan and the Akamba and Nandi in Central Africa, the Tinguanes in the Philippines and the inhabitants of the Nikobari Islands and of Madagascar and Borneo. Among some of these races the prohibition and its consequences hold good only for the period of mourning while in others it remains permanent; but in all cases it seems to diminish with the lapse of time after the death.

The avoidance of the name of the deceased is as a rule kept up with extraordinary severity. Thus, among many South American tribes, it is considered the gravest insult to the survivors to pronounce the name of the deceased in their presence, and the penalty set for it is no less than that for the slaying itself. At first it is not easy to guess why the mention of the name should be so abominated, but the dangers associated with it have called into being a whole series of interesting and important expedients to avoid this. Thus the Masai in Africa have hit upon the evasion of changing the name of the deceased immediately upon his death; he may now be mentioned without dread by this new name, while all the prohibitions

remain attached to the old name. It seems to be assumed that the ghost does not know his new name and will not find it out. The Australian tribes on Adelaide and Encounter Bay are so consistently cautious that when a death occurs almost every person who has the same name as the deceased or a very similar one, exchanges it for another. Sometimes by a further extension of the same idea as seen among several tribes in Victoria and in North America all the relatives of the deceased change their names regardless of whether their names resemble the name of the deceased in sound. Among the Guaycuru in Paraguay the chief used to give new names to all the members of the tribe, on such sad occasions, which they then remembered as if they had always had them.

Furthermore, if the deceased had the same name as an animal or object, etc., some of the races just enumerated thought it necessary to give these animals and objects new names, in order not to be reminded of the deceased when they mentioned them. Through this there must have resulted a never ceasing change of vocabulary, which caused a good deal of difficulty for the missionaries, especially where the interdiction upon a name was permanent. In the seven years which the missionary Dobrizhofer spent among the Abipons in Paraguay, the name for jaguar was changed three times and the words for crocodile, thorns and animal slaughter underwent a similar fate. But the dread of pronouncing a name which has belonged to a deceased person extends also to the mention of everything in which the deceased had any part, and a further important result of this process of suppression is that these races have no tradition or any historical reminiscences, so that we encounter the greatest difficulties in investigating their past history. Among a number of these primitive races compensating customs have also been established in order to re-awaken the names of the deceased after a long period of mourning; they are bestowed upon children who were regarded as reincarnations of the dead.

The strangeness of this taboo on names diminishes if we bear in mind that the savage looks upon his name as an essential part and an important possession of his personality, and that he ascribes the full significance of things to words. Our children do the same, as I have shown elsewhere, and therefore they are never satisfied with accepting a meaningless verbal similarity, but consistently conclude that when two things have identical names a deeper correspondence between them must exist. Numerous peculiarities of normal behaviour may lead civilized man to conclude that

he too is not yet as far removed as he thinks from attributing the importance of things to mere names and feeling that his name has become peculiarly identified with his person. This is corroborated by psychoanalytic experiences, where there is much occasion to point out the importance of names in unconscious thought activity. As was to be expected, the compulsion neurotics behave just like savages in regard to names. They show the full ‘complex sensitiveness’ towards the utterance and hearing of special words (as do also other neurotics) and derive a good many, often serious, inhibitions from their treatment of their own name. One of these taboo patients whom I knew, had adopted the avoidance of writing down her name for fear that it might get into somebody’s hands who thus would come into possession of a piece of her personality. In her frenzied faithfulness, which she needed to protect herself against the temptations of her phantasy, she had created for herself the commandment, ‘not to give away anything of her personality’. To this belonged first of all her name, then by further application her hand-writing, so that she finally gave up writing.

Thus it no longer seems strange to us that savages should consider a dead person’s name as a part of his personality and that it should be subjected to the same taboo as the deceased. Calling a dead person by name can also be traced back to contact with him, so that we can turn our attention to the more inclusive problem of why this contact is visited with such a severe taboo.

The nearest explanation would point to the natural horror which a corpse inspires, especially in view of the changes so soon noticeable after death. Mourning for a dead person must also be considered as a sufficient motive for everything which has reference to him. But horror of the corpse evidently does not cover all the details of taboo rules, and mourning can never explain to us why the mention of the dead is a severe insult to his survivors. On the contrary, mourning loves to preoccupy itself with the deceased, to elaborate his memory, and preserve it for the longest possible time. Something besides mourning must be made responsible for the peculiarities of taboo customs, something which evidently serves a different purpose. It is this very taboo on names which reveals this still unknown motive, and if the customs did not tell us about it we would find it out from the statements of the mourning savages themselves.

For they do not conceal the fact that they fear the presence and the return of the spirit of a dead person; they practise a host of ceremonies to keep him off and banish him. They look upon the mention of his name as a conjuration which must result in his immediate presence. They therefore consistently do everything to avoid conjuring and awakening a dead person. They disguise themselves in order that the spirit may not recognize them, they distort either his name or their own, and become infuriated when a ruthless stranger incites the spirit against his survivors by mentioning his name. We can hardly avoid the conclusion that they suffer, according to Wundt's expression, from the fear of "his soul now turned into a demon,".

With this understanding we approach Wundt's conception who, as we have heard, sees the nature of taboo in the fear of demons.

The assumption which this theory makes, namely, that immediately after death the beloved member of a family becomes a demon, from whom the survivors have nothing but hostility to expect, so that they must protect themselves by every means from his evil desires, is so peculiar that our first impulse is not to believe it. Yet almost all competent authors agree as to this interpretation of primitive races. Westermarck, who, in my opinion, gives altogether too little consideration to taboo, makes this statement: "On the whole facts lead me to conclude that the dead are more frequently regarded as enemies than as friends and that Jevons and Grant Allen are wrong in their assertion that it was formerly believed that the malevolence of the dead was as a rule directed only against strangers, while they were paternally concerned about the life and welfare of their descendants and the members of their clan."

R. Kleinpaul has written an impressive book in which he makes use of the remnants of the old belief in souls among civilized races to show the relation between the living and the dead. According to him too, this relation culminates in the conviction that the dead, thirsting for blood, draw the living after them. The living did not feel themselves safe from the persecutions of the dead until a body of water had been put between them. That is why it was preferred to bury the dead on islands or to bring them to the other side of a river: the expressions 'here' and 'beyond' originated in this way. Later moderation has restricted the malevolence of the dead to those categories where a peculiar right to feel rancour had to be admitted, such as the murdered who pursue their murderer as evil

spirits, and those who, like brides, had died with their longings unsatisfied. Kleinpaul believes that originally, however, the dead were all vampires, who bore ill-will to the living, and strove to harm them and deprive them of life. It was the corpse that first furnished the conception of an evil spirit.

The hypothesis that those whom we love best turn into demons after death obviously allows us to put a further question. What prompted primitive races to ascribe such a change of sentiment to the beloved dead? Why did they make demons out of them? According to Westermarck this question is easily answered. “As death is usually considered the worst calamity that can overtake man, it is believed that the deceased are very dissatisfied with their lot. Primitive races believe that death comes only through being slain, whether by violence or by magic, and this is considered already sufficient reason for the soul to be vindictive and irritable. The soul presumably envies the living and longs for the company of its former kin; we can therefore understand that the soul should seek to kill with them diseases in order to be re-united with them....

“ ...A further explanation of the malevolence ascribed to souls lies in the instinctive fear of them, which is itself the result of the fear of death.”

Our study of psychoneurotic disturbances points to a more comprehensive explanation, which includes that of Westermarck.

When a wife loses her husband, or a daughter her mother, it not infrequently happens that the survivor is afflicted with tormenting scruples, called ‘obsessive reproaches’ which raises the question whether she herself has not been guilty through carelessness or neglect, of the death of the beloved person. No recalling of the care with which she nursed the invalid, or direct refutation of the asserted guilt can put an end to the torture, which is the pathological expression of mourning and which in time slowly subsides. Psychoanalytic investigation of such cases has made us acquainted with the secret mainsprings of this affliction. We have ascertained that these obsessive reproaches are in a certain sense justified and therefore are immune to refutation or objections. Not that the mourner has really been guilty of the death or that she has really been careless, as the obsessive reproach asserts; but still there was something in her, a wish of which she herself was unaware, which was not displeased with the fact that death came, and which would have brought it about sooner had it been strong enough. The reproach now reacts against this unconscious wish

after the death of the beloved person. Such hostility, hidden in the unconscious behind tender love, exists in almost all cases of intensive emotional allegiance to a particular person, indeed it represents the classic case, the prototype of the ambivalence of human emotions. There is always more or less of this ambivalence in everybody's disposition; normally it is not strong enough to give rise to the obsessive reproaches we have described. But where there is abundant predisposition for it, it manifests itself in the relation to those we love most, precisely where you would least expect it. The disposition to compulsion neurosis which we have so often taken for comparison with taboo problems, is distinguished by a particularly high degree of this original ambivalence of emotions.

We now know how to explain the supposed demonism of recently departed souls and the necessity of being protected against their hostility through taboo rules. By assuming a similar high degree of ambivalence in the emotional life of primitive races such as psychoanalysis ascribes to persons suffering from compulsion neurosis, it becomes comprehensible that the same kind of reaction against the hostility latent in the unconscious behind the obsessive reproaches of the neurotic should also be necessary here after the painful loss has occurred. But this hostility which is painfully felt in the unconscious in the form of satisfaction with the demise, experiences a different fate in the case of primitive man: the defence against it is accomplished by displacement upon the object of hostility, namely the dead. We call this defence process, frequent both in normal and diseased psychic life, a *projection*. The survivor will deny that he has ever entertained hostile impulses toward the beloved dead; but now the soul of the deceased entertains them and will try to give vent to them during the entire period of mourning. In spite of the successful defence through projection, the punitive and remorseful character of this emotional reaction manifests itself in being afraid, in self-imposed renunciations and in subjection to restrictions which are partly disguised as protective measures against the hostile demon. Thus we find again that taboo has grown out of the soil of an ambivalent emotional attitude. The taboo of the dead also originates from the opposition between the conscious grief and the unconscious satisfaction at death. If this is the origin of the resentment of spirits it is self-evident that just the nearest and formerly most beloved survivors have to fear it most.

As in neurotic symptoms, the taboo regulations also evince opposite feelings. Their restrictive character expresses mourning, while they also betray very clearly what they are trying to conceal, namely, the hostility towards the dead, which is now motivated as self-defence. We have learnt to understand part of the taboo regulations as temptation fears. A dead person is defenceless, which must act as an incitement to satisfy hostile desires entertained against him; this temptation has to be opposed by the prohibition.

But Westermarck is right in not admitting any difference in the savage's conception between those who have died by violence and those who have died a natural death. As will be shown later, in the unconscious mode of thinking even a natural death is perceived as murder; the person was killed by evil wishes. Any one interested in the origin and meaning of dreams dealing with the death of dear relatives such as parents and brothers and sisters will find that the same feeling of ambivalence is responsible for the fact that the dreamer, the child, and the savage all have the same attitude towards the dead.

A little while ago we challenged Wundt's conception, who explains the nature of taboo through the fear of demons, and yet we have just agreed with the explanation which traces back the taboo of the dead to a fear of the soul of the dead after it has turned into a demon. This seems like a contradiction, but it will not be difficult for us to explain it. It is true that we have accepted the idea of demons, but we know that this assumption is not something final which psychology cannot resolve into further elements. We have, as it were, exposed the demons by recognizing them as mere projections of hostile feelings which the survivor entertains towards the dead.

The double feeling — tenderness and hostility — against the deceased, which we consider well founded, endeavours to assert itself at the time of bereavement as mourning and satisfaction. A conflict must ensue between these contrary feelings, and as one of them, namely the hostility, is altogether or for the greater part unconscious, the conflict cannot result in a conscious difference in the form of hostility or tenderness as, for instance, when we forgive an injury inflicted upon us by some one we love. The process usually adjusts itself through a special psychic mechanism, which is designated in psychoanalysis as *projection*. This unknown hostility, of which we are ignorant and of which we do not wish

to know, is projected from our inner perception into the outer world and is thereby detached from our own person and attributed to the other. Not we, the survivors, rejoice because we are rid of the deceased, on the contrary, we mourn for him; but now, curiously enough, he has become an evil demon who would rejoice in our misfortune and who seeks our death. The survivors must now defend themselves against this evil enemy; they are freed from inner oppression, but they have only succeeded in exchanging it for an affliction from without.

It is not to be denied that this process of projection, which turns the dead into malevolent enemies, finds some support in the real hostilities of the dead which the survivors remember and with which they really can reproach the dead. These hostilities are harshness, the desire to dominate, injustice, and whatever else forms the background of even the most tender relations between men. But the process cannot be so simple that this factor alone could explain the origin of demons by projection. The offences of the dead certainly motivate in part the hostility of the survivors, but they would have been ineffective if they had not given rise to this hostility and the occasion of death would surely be the least suitable occasion for awakening the memory of the reproaches which justly could have been brought against the deceased. We cannot dispense with the unconscious hostility as the constant and really impelling motive. This hostile tendency towards those nearest and dearest could remain latent during their lifetime, that is to say, it could avoid betraying itself to consciousness either directly or indirectly through any substitutive formation. However, when the person who was simultaneously loved and hated died, this was no longer possible, and the conflict became acute. The mourning originating from the enhanced tenderness, became on the one hand more intolerant of the latent hostility, while on the other hand it could not tolerate that the latter should not give origin to a feeling of pure gratification. Thus there came about the repression of the unconscious hostility through projection, and the formation of the ceremonial in which fear of punishment by demons finds expression. With the termination of the period of mourning, the conflict also loses its acuteness so that the taboo of the dead can be abated or sink into oblivion.

Having thus explained the basis on which the very instructive taboo of the dead has grown up, we must not miss the opportunity of adding a few observations which may become important for the understanding of taboo in general.

The projection of unconscious hostility upon demons in the taboo of the dead is only a single example from a whole series of processes to which we must grant the greatest influence in the formation of primitive psychic life. In the foregoing case the mechanism of projection is used to settle an emotional conflict; it serves the same purpose in a large number of psychic situations which lead to neuroses. But projection is not specially created for the purpose of defence, it also comes into being where there are no conflicts. The projection of inner perceptions to the outside is a primitive mechanism which, for instance, also influences our sense-perceptions, so that it normally has the greatest share in shaping our outer world. Under conditions that have not yet been sufficiently determined even inner perceptions of ideational and emotional processes are projected outwardly, like sense perceptions, and are used to shape the outer world, whereas they ought to remain in the inner world. This is perhaps genetically connected with the fact that the function of attention was originally directed not towards the inner world, but to the stimuli streaming in from the outer world, and only received reports of pleasure and pain from the endopsychic processes. Only with the development of the language of abstract thought through the association of sensory remnants of word representations with inner processes, did the latter gradually become capable of perception. Before this took place primitive man had developed a picture of the outer world through the outward projection of inner perceptions, which we, with our reinforced conscious perception, must now translate back into psychology.

The projection of their own evil impulses upon demons is only a part of what has become the world system (‘Weltanschauung’) of primitive man which we shall discuss later as ‘animism’. We shall then have to ascertain the psychological nature of such a system formation and the points of support which we shall find in the analysis of these system formations will again bring us face to face with the neurosis. For the present we merely wish to suggest that the ‘secondary elaboration’ of the dream content is the prototype of all these system formations. And let us not forget that beginning at the stage of system formation there are two origins for every

act judged by consciousness, namely the systematic, and the real but unconscious origin.

Wundt remarks that “among the influences which myth everywhere ascribes to demons the evil ones preponderate, so that according to the religions of races evil demons are evidently older than good demons.” Now it is quite possible that the whole conception of demons was derived from the extremely important relation to the dead. In the further course of human development the ambivalence inherent in this relation then manifested itself by allowing two altogether contrary psychic formations to issue from the same root, namely, the fear of demons and of *ghosts*, and the reverence for ancestors. Nothing testifies so much to the influence of mourning on the origin of belief in demons as the fact that demons were always taken to be the spirits of persons not long dead. Mourning has a very distinct psychic task to perform, namely, to detach the memories and expectations of the survivors from the dead. When this work is accomplished the grief, and with it the remorse and reproach, lessens, and therefore also the fear of the demon. But the very spirits which at first were feared as demons now serve a friendlier purpose; they are revered as ancestors and appealed to for help in times of distress.

If we survey the relation of survivors to the dead through the course of the ages, it is very evident that the ambivalent feeling has extraordinarily abated. We now find it easy to suppress whatever unconscious hostility towards the dead there may still exist without any special psychic effort on our part. Where formerly satisfied hate and painful tenderness struggled with each other, we now find piety, which appears like a cicatrice and demands: *De mortuis nil nisi bene*. Only neurotics still blur the mourning for the loss of their dear ones with attacks of compulsive reproaches which psychoanalysis reveals as the old ambivalent emotional feeling. How this change was brought about, and to what extent constitutional changes and real improvement of familiar relations share in causing the abatement of the ambivalent feeling, need not be discussed here. But this example would lead us to assume *that the psychic impulses of primitive man possessed a higher degree of ambivalence than is found at present among civilized human beings. With the decline of this ambivalence the taboo, as the compromise symptom of the ambivalent conflict, also slowly disappeared.* Neurotics who are compelled to reproduce this conflict, together with the taboo resulting from it, may be said to have brought with

them an atavistic remnant in the form of an archaic constitution the compensation of which in the interest of cultural demands entails the most prodigious psychic efforts on their part.

At this point we may recall the confusing information which Wundt offered us about the double meaning of the word taboo, namely, holy and unclean (see above). It was supposed that originally the word taboo did not yet mean holy and unclean but signified something demonic, something which may not be touched, thus emphasizing a characteristic common to both extremes of the later conception; this persistent common trait proves, however, that an original correspondence existed between what was holy and what was unclean, which only later became differentiated.

In contrast to this, our discussion readily shows that the double meaning in question belonged to the word taboo from the very beginning and that it serves to designate a definite ambivalence as well as everything which has come into existence on the basis of this ambivalence. Taboo is itself an ambivalent word and by way of supplement we may add that the established meaning of this word might of itself have allowed us to guess what we have found as the result of extensive investigation, namely, that the taboo prohibition is to be explained as the result of an emotional ambivalence. A study of the oldest languages has taught us that at one time there were many such words which included their own contrasts so that they were in a certain sense ambivalent, though perhaps not exactly in the same sense as the word taboo. Slight vocal modifications of this primitive word containing two opposite meanings later served to create a separate linguistic expression for the two opposites originally united in one word.

The word taboo has had a different fate; with the diminished importance of the ambivalence which it connotes it has itself disappeared, or rather, the words analogous to it have vanished from the vocabulary. In a later connection I hope to be able to show that a tangible historic change is probably concealed behind the fate of this conception; that the word at first was associated with definite human relations which were characterized by great emotional ambivalence from which it expanded to other analogous relations.

Unless we are mistaken, the understanding of taboo also throws light upon the nature and origin of *conscience*. Without stretching ideas we can speak of a taboo conscience and a taboo sense of guilt after the violation

of a taboo. Taboo conscience is probably the oldest form in which we meet the phenomenon of conscience.

For what is ‘conscience’? According to linguistic testimony it belongs to what we know most surely; in some languages its meaning is hardly to be distinguished from consciousness.

Conscience is the inner perception of objections to definite wish impulses that exist in us; but the emphasis is put upon the fact that this rejection does not have to depend on anything else, that it is sure of itself. This becomes even plainer in the case of a guilty conscience, where we become aware of the inner condemnation of such acts which realized some of our definite wish impulses. Confirmation seems superfluous here; whoever has a conscience must feel in himself the justification of the condemnation, and the reproach for the accomplished action. But this same character is evinced by the attitude of savages towards taboo. Taboo is a command of conscience, the violation of which causes a terrible sense of guilt which is as self-evident as its origin is unknown.

It is therefore probable that conscience also originates on the basis of an ambivalent feeling from quite definite human relations which contain this ambivalence. It probably originates under conditions which are in force both for taboo and the compulsion neurosis, that is, one component of the two contrasting feelings is unconscious and is kept repressed by the compulsive domination of the other component. This is confirmed by many things which we have learned from our analysis of neurosis. In the first place the character of compulsion neurotics shows a predominant trait of painful conscientiousness which is a symptom of reaction against the temptation which lurks in the unconscious, and which develops into the highest degrees of guilty conscience as their illness grows worse. Indeed, one may venture the assertion that if the origin of guilty conscience could not be discovered through compulsion neurotic patients, there would be no prospect of ever discovering it. This task is successfully solved in the case of the individual neurotic, and we are confident of finding a similar solution in the case of races.

In the second place we cannot help noticing that the sense of guilt contains much of the nature of anxiety; without hesitation it may be described as ‘conscience phobia’. But fear points to unconscious sources. The psychology of the neuroses taught us that when wish feelings undergo repression their libido becomes transformed into anxiety. In addition we

must bear in mind that the sense of guilt also contains something unknown and unconscious, namely the motivation for the rejection. The character of anxiety in the sense of guilt corresponds to this unknown quantity.

If taboo expresses itself mainly in prohibitions it may well be considered self-evident, without remote proof from the analogy with neurosis that it is based on a positive, desireful impulse. For what nobody desires to do does not have to be forbidden, and certainly whatever is expressly forbidden must be an object of desire. If we applied this plausible theory to primitive races we would have to conclude that among their strongest temptations were desires to kill their kings and priests, to commit incest, to abuse their dead and the like. That is not very probable. And if we should apply the same theory to those cases in which we ourselves seem to hear the voice of conscience most clearly we would arouse the greatest contradiction. For there we would assert with the utmost certainty that we did not feel the slightest temptation to violate any of these commandments, as for example, the commandment: Thou shalt not kill, and that we felt nothing but repugnance at the very idea.

But if we grant the testimony of our conscience the importance it claims, then the prohibition — the taboo as well as our moral prohibitions — becomes superfluous, while the existence of a conscience, in turn, remains unexplained and the connection between conscience, taboo and neurosis disappears. The net result of this would then be our present state of understanding unless we view the problem psychoanalytically.

But if we take into account the following results of psychoanalysis, our understanding of the problem is greatly advanced. The analysis of dreams of normal individuals has shown that our own temptation to kill others is stronger and more frequent than we had suspected and that it produces psychic effects even where it does not reveal itself to our consciousness. And when we have learnt that the obsessive rules of certain neurotics are nothing but measures of self-reassurance and self-punishment erected against the reinforced impulse to commit murder, we can return with fresh appreciation to our previous hypothesis that every prohibition must conceal a desire. We can then assume that this desire to murder actually exists and that the taboo as well as the moral prohibition are psychologically by no means superfluous but are, on the contrary, explained and justified through our ambivalent attitude towards the impulse to slay.

The nature of this ambivalent relation so often emphasized as fundamental, namely, that the positive underlying desire is unconscious, opens the possibility of showing further connections and explaining further problems. The pyschic processes in the unconscious are not entirely identical with those known to us from our conscious psychic life, but have the benefit of certain notable liberties of which the latter are deprived. An unconscious impulse need not have originated where we find it expressed, it can spring from an entirely different place and may originally have referred to other persons and relations, but through the mechanism of *displacement*, it reaches the point where it comes to our notice. Thanks to the indestructibility of unconscious processes and their inaccessibility to correction, the impulse may be saved over from earlier times to which it was adapted to later periods and conditions in which its manifestations must necessarily seem foreign. These are all only hints, but a careful elaboration of them would show how important they may become for the understanding of the development of civilization.

In closing these discussions we do not want to neglect to make an observation that will be of use for later investigations. Even if we insist upon the essential similarity between taboo and moral prohibitions we do not dispute that a psychological difference must exist between them. A change in the relations of the fundamental ambivalence can be the only reason why the prohibition no longer appears in the form of a taboo.

In the analytical consideration of taboo phenomena we have hitherto allowed ourselves to be guided by their demonstrable agreements with compulsion neurosis; but as taboo is not a neurosis but a social creation we are also confronted with the task of showing wherein lies the essential difference between the neurosis and a product of culture like the taboo.

Here again I will take a single fact as my starting point. Primitive races fear a punishment for the violation of a taboo, usually a serious disease or death. This punishment threatens only him who has been guilty of the violation. It is different with the compulsion neurosis. If the patient wants to do something that is forbidden to him he does not fear punishment for himself, but for another person. This person is usually indefinite, but, by means of analysis, is easily recognized as some one very near and dear to the patient. The neurotic therefore acts as if he were altruistic, while primitive man seems egotistical. Only if retribution fails to overtake the taboo violator spontaneously does a collective feeling awaken among

savages that they are all threatened through the sacrilege, and they hasten to inflict the omitted punishment themselves. It is easy for us to explain the mechanism of this solidarity. It is a question of fear of the contagious example, the temptation to imitate, that is to say, of the capacity of the taboo to infect. If some one has succeeded in satisfying the repressed desire, the same desire must manifest itself in all his companions; hence, in order to keep down this temptation, this envied individual must be despoiled of the fruit of his daring. Not infrequently the punishment gives the executors themselves an opportunity to commit the same sacrilegious act by justifying it as an expiation. This is really one of the fundamentals of the human code of punishment which rightly presumes the same forbidden impulses in the criminal and in the members of society who avenge his offence.

Psychoanalysis here confirms what the pious were wont to say, that we are all miserable sinners. How then shall we explain the unexpected nobility of the neurosis which fears nothing for itself and everything for the beloved person? Psychoanalytic investigation shows that this nobility is not primary. Originally, that is to say at the beginning of the disease, the threat of punishment pertained to one's own person; in every case the fear was for one's own life; the fear of death being only later displaced upon another beloved person. The process is somewhat complicated but we have a complete grasp of it. An evil impulse — a death wish — towards the beloved person is always at the basis of the formation of a prohibition. This is repressed through a prohibition, and the prohibition is connected with a certain act which by displacement usually substitutes the hostile for the beloved person, and the execution of this act is threatened with the penalty of death. But the process goes further and the original wish for the death of the beloved other person is then replaced by fear for his death. The tender altruistic trait of the neurosis therefore merely *compensates* for the opposite attitude of brutal egotism which is at the basis of it. If we designate as social those emotional impulses which are determined through regard for another person who is not taken as a sexual object, we can emphasize the withdrawal of these social factors as an essential feature of the neurosis, which is later disguised through overcompensation.

Without lingering over the origin of these social impulses and their relation to other fundamental impulses of man, we will bring out the

second main characteristic of the neurosis by means of another example. The form in which taboo manifests itself has the greatest similarity to the touching phobia of neurotics, the *Délire de toucher*. As a matter of fact this neurosis is regularly concerned with the prohibition of sexual touching and psychoanalysis has quite generally shown that the motive power which is deflected and displaced in the neurosis is of sexual origin. In taboo the forbidden contact has evidently not only sexual significance but rather the more, general one of attack, of acquisition and of personal assertion. If it is prohibited to touch the chief or something that was in contact with him it means that an inhibition should be imposed upon the same impulse which on other occasions expresses itself in suspicious surveillance of the chief and even in physical ill-treatment of him before his coronation (see above). *Thus the preponderance of sexual components of the impulse over the social components is the determining factor of the neurosis.* But the social impulses themselves came into being through the union of egotistical and erotic components into special entities.

From this single example of a comparison between taboo and compulsion neurosis it is already possible to guess the relation between individual forms of the neurosis and the creations of culture, and in what respect the study of the psychology of the neurosis is important for the understanding of the development of culture.

In one way the neuroses show a striking and far-reaching correspondence with the great social productions of art, religion and philosophy, while again they seem like distortions of them. We may say that hysteria is a caricature of an artistic creation, a compulsion neurosis, a caricature of a religion, and a paranoic delusion, a caricature of a philosophic system. In the last analysis this deviation goes back to the fact that the neuroses are asocial formations; they seek to accomplish by private means what arose in society through collective labour. In analysing the impulse of the neuroses one learns that motive powers of sexual origin exercise the determining influence in them, while the corresponding cultural creations rest upon social impulses and on such as have issued from the combination of egotistical and sexual components. It seems that the sexual need is not capable of uniting men in the same way as the demands of self preservation; sexual satisfaction is in the first place the private concern of the individual.

Genetically the asocial nature of the neurosis springs from its original tendency to flee from a dissatisfying reality to a more pleasurable world of phantasy. This real world which neurotics shun is dominated by the society of human beings and by the institutions created by them; the estrangement from reality is at the same time a withdrawal from human companionship.

CHAPTER III. ANIMISM, MAGIC AND THE OMNIPOTENCE OF THOUGHT

1

IT is a necessary defect of studies which seek to apply the point of view of psychoanalysis to the mental sciences that they cannot do justice to either subject. They therefore confine themselves to the rôle of incentives and make suggestions to the expert which he should take into consideration in his work. This defect will make itself felt most strongly in an essay such as this which tries to treat of the enormous sphere called animism.

Animism in the narrower sense is the theory of psychic concepts, and in the wider sense, of spiritual beings in general. Animatism, the animation theory of seemingly inanimate nature, is a further subdivision which also includes animatism and animism. The name animism, formerly applied to a definite philosophic system, seems to have acquired its present meaning through E. B. Tylor.

What led to the formulation of these names is the insight into the very remarkable conceptions of nature and the world of those primitive races known to us from history and from our own times. These races populate the world with a multitude of spiritual beings which are benevolent or malevolent to them, and attribute the causation of natural processes to these spirits and demons; they also consider that not only animals and plants, but inanimate things as well are animated by them. A third and perhaps the most important part of this primitive ‘nature philosophy’ seems far less striking to us because we ourselves are not yet far enough removed from it, though we have greatly limited the existence of spirits and to-day explain the processes of nature by the assumption of impersonal physical forces. For primitive people believe in a similar ‘animation’ of human individuals as well. Human beings have souls which can leave their habitation and enter into other beings; these souls are the bearers of spiritual activities and are, to a certain extent, independent of the ‘bodies’. Originally souls were thought of as being very similar to individuals; only in the course of a long evolution did they lose their material character and attain a high degree of ‘spiritualization’.

Most authors incline to the assumption that these soul conceptions are the original nucleus of the animistic system, that spirits merely correspond to souls that have become independent, and that the souls of animals, plants and things were formed after the analogy of human souls.

How did primitive people come to the peculiarly dualistic fundamental conceptions on which this animistic system rests? Through the observation, it is thought, of the phenomena of sleep (with dreams) and death which resemble sleep, and through the effort to explain these conditions, which affect each individual so intimately. Above all, the problem of death must have become the starting point of the formation of the theory. To primitive man the continuation of life — immortality — would be self-evident. The conception of death is something accepted later, and only with hesitation, for even to us it is still devoid of content and unrealizable. Very likely discussions have taken place over the part which may have been played by other observations and experiences in the formation of the fundamental animistic conceptions such as dream imagery, shadows and reflections, but these have led to no conclusion.

If primitive man reacted to the phenomena that stimulated his reflection with the formation of conceptions of the soul, and then transferred these to objects of the outer world, his attitude will be judged to be quite natural and in no way mysterious. In view of the fact that animistic conceptions have been shown to be similar among the most varied races and in all periods, Wundt states that these “are the necessary psychological product of the myth-forming consciousness, and primitive animism may be looked upon as the spiritual expression of man’s natural state in so far as this is at all accessible to our observation”. Hume has already justified the animation of the inanimate in his *Natural History of Religions*, where he said: “There is a universal tendency among mankind to conceive all beings like themselves and to transfer to every object those qualities with which they are familiarly acquainted and of which they are intimately conscious”.

Animism is a system of thought, it gives not only the explanation of a single phenomenon, but makes it possible to comprehend the totality of the world from one point, as a continuity. Writers maintain that in the course of time three such systems of thought, three great world systems came into being: the animistic (mythological), the religious, and the scientific. Of these animism, the first system is perhaps the most

consistent and the most exhaustive, and the one which explains the nature of the world in its entirety. This first world system, of mankind is now a psychological theory. It would go beyond our scope to show how much of it can still be demonstrated in the life of to-day, either as a worthless survival in the form of superstition, or in living form, as the foundation of our language, our belief, and our philosophy.

It is in reference to the successive stages of these three world systems that we say that animism in itself was not yet a religion but contained the prerequisites from which religions were later formed. It is also evident that myths are based upon animistic foundations, but the detailed relation of myths to animism seem unexplained in some essential points.

2

Our psychoanalytic work will begin at a different point. It must not be assumed that mankind came to create its first world system through a purely speculative thirst for knowledge. The practical need of mastering the world must have contributed to this effort. We are therefore not astonished to learn that something else went hand in hand with the animistic system, namely the elaboration of directions for making oneself master of men, animals and things, as well as of their spirits. S. Reinach wants to call these directions, which are known under the names of ‘sorcery and magic’, the strategy of animism; With Mauss and Hubert, I should prefer to compare them to a technique.

Can the conceptions of sorcery and magic be separated? It can be done if we are willing on our own authority to put ourselves above the vagaries of linguistic usage. Then sorcery is essentially the art of influencing spirits by treating them like people under the same circumstances, that is to say by appeasing them, reconciling them, making them more favourably disposed to one, by intimidating them, by depriving them of their power and by making them subject to one’s will; all that is accomplished through the same methods that have been found effective with living people. Magic, however, is something else; it does not essentially concern itself with spirits, and uses special means, not the ordinary psychological method. We can easily guess that magic is the earlier and the more important part of animistic technique, for among the means with which spirits are to be treated there are also found the magic kind, and magic is

also applied where spiritualization of nature has not yet, as it seems to us, been accomplished.

Magic must serve the most varied purposes. It must subject the processes of nature to the will of man, protect the individual against enemies and dangers, and give him the power to injure his enemies. But the principles on whose assumptions the magic activity is based, or rather the principle of magic, is so evident that it was recognized by all authors. If we may take the opinion of E. B. Tylor at its face value it can be most tersely expressed in his words: “mistaking an ideal connection for a real one”. We shall explain this characteristic in the case of two groups of magic acts.

One of the most widespread magic procedures for injuring an enemy consists of making an effigy of him out of any kind of material. The likeness counts for little, in fact any object may be ‘named’ as his image. Whatever is subsequently done to this image will also happen to the hated prototype; thus if the effigy has been injured in any place he will be afflicted by a disease in the corresponding part of the body. This same magic technique, instead of being used for private enmity can also be employed for pious purposes and can thus be used to aid the gods against evil demons. I quote Frazer: “Every night when the sun-god Ra in ancient Egypt sank to his home in the glowing west he was assailed by hosts of demons under the leadership of the archfiend Apepi. All night long he fought them, and sometimes by day the powers of darkness sent up clouds even into the blue Egyptian sky to obscure his light and weaken his power. To aid the sun-god in this daily struggle, a ceremony was daily performed in his temple at Thebes. A figure of his foe Apepi, represented as a crocodile with a hideous face or a serpent with many coils, was made of wax, and on it the demon’s name was written in green ink. Wrapt in a papyrus case, on which another likeness of Apepi had been drawn in green ink, the figure was then tied up with black hair, spat upon, hacked with a stone knife and cast on the ground. There the priest trod on it with his left foot again and again, and then burned it in a fire made of a certain plant or grass. When Apepi himself had thus been effectively disposed of, waxen effigies of each of his principle demons, and of their fathers, mothers, and children, were made and burnt in the same way. The service accompanied by the recitation of certain prescribed spells, was repeated not merely morning, noon and night, but whenever a storm was raging or heavy rain

had set in, or black clouds were stealing across the sky to hide the sun's bright disk. The fiends of darkness, clouds and rain, felt the injury inflicted on their images as if it had been done to themselves; they passed away, at least for a time, and the beneficent sun-god shone out triumphant once more".

There is a great mass of magic actions which show a similar motivation, but I shall lay stress upon only two, which have always played a great rôle among primitive races and which have been partly preserved in the myths and cults of higher stages of evolution: the art of causing rain and fruitfulness by magic. Rain is produced by magic means, by imitating it, and perhaps also by imitating the clouds and storm which produce it. It looks as if they wanted to 'play rain'. The Ainos of Japan, for instance, make rain by pouring out water through a big sieve, while others fit out a big bowl with sails and oars as if it were a ship, which is then dragged about the village and gardens. But the fruitfulness of the soil was assured by magic means by showing it the spectacle of human sexual intercourse. To cite one out of many examples; in some part of Java, the peasants used to go out into the fields at night for sexual intercourse when the rice was about to blossom in order to stimulate the rice to fruitfulness through their example. At the same time it was feared that proscribed incestuous relationships would stimulate the soil to grow weeds and render it unfruitful.

Certain negative rules, that is to say magic precautions, must be put into this first group. If some of the inhabitants of a Dayak village had set out on a hunt for wild-boars, those remaining behind were in the meantime not permitted to touch either oil or water with their hands, as such acts would soften the hunters' fingers and would let the quarry slip through their hands. Or when a Gilyak hunter was pursuing game in the woods, his children were forbidden to make drawings on wood or in the sand, as the paths in the thick woods might become as intertwined as the lines of the drawing and the hunter would not find his way home.

The fact that in these as in a great many other examples of magic influence, distance plays no part, telepathy is taken as a matter of course — will cause us no difficulties in grasping the peculiarity of magic.

There is no doubt about what is considered the effective force in all these examples. It is the *similarity* between the performed action and the expected happening. Frazer therefore calls this kind of magic *imitative* or

homœopathic. If I want it to rain I only have to produce something that looks like rain or recalls rain. In a later phase of cultural development, instead of these magic conjurations of rain, processions are arranged to a house of god, in order to supplicate the saint who dwells there to send rain. Finally also this religious technique will be given up and instead an effort will be made to find out what would influence the atmosphere to produce rain.

In another group of magic actions the principle of similarity is no longer involved, but in its stead there is another principle the nature of which is well brought out in the following examples.

Another method may be used to injure an enemy. You possess yourself of his hair, his nails, anything that he has discarded, or even a part of his clothing, and do something hostile to these things. This is just as effective as if you had dominated the person himself, and anything that you do to the things that belong to him must happen to him too. According to the conception of primitive men a name is an essential part of a personality; if therefore you know the name of a person or a spirit you have acquired a certain power over its bearer. This explains the remarkable precautions and restrictions in the use of names which we have touched upon in the essay on taboo. In these examples similarity is evidently replaced by relationship.

The cannibalism of primitive races derives its more sublime motivation in a similar manner. By absorbing parts of the body of a person through the act of eating we also come to possess the properties which belonged to that person. From this there follow precautions and restrictions as to diet under special circumstances. Thus a pregnant woman will avoid eating the meat of certain animals because their undesirable properties, for example, cowardice, might thus be transferred to the child she is nourishing. It makes no difference to the magic influence whether the connection is already abolished or whether it had consisted of only one very important contact. Thus, for instance, the belief in a magic bond which links the fate of a wound with the weapon which caused it can be followed unchanged through thousands of years. If a Melanesian gets possession of the bow by which he was wounded he will carefully keep it in a cool place in order thus to keep down the inflammation of the wound. But if the bow has remained in the possession of the enemy it will certainly be kept in close proximity to a fire in order that the wound may burn and become

thoroughly inflamed. Pliny, in his *Natural History*, XXVIII, advises spitting on the hand which has caused the injury if one regrets having injured some one; the pain of the injured person will then immediately be eased. Francis Bacon, in his *Natural History*, mentions the generally accredited belief that putting a salve on the weapon which has made a wound will cause this wound to heal of itself. It is said that even to-day English peasants follow this prescription, and that if they have cut themselves with a scythe they will from that moment on carefully keep the instrument clean in order that the wound may not fester. In June, 1902, a local English weekly reported that a woman called Matilde Henry of Norwich accidentally ran an iron nail into the sole of her foot. Without having the wound examined or even taking off her stocking she bade her daughter to oil the nail thoroughly in the expectation that then nothing could happen to her. She died a few days later of tetanus in consequence of postponed antisepsis.

The examples from this last group illustrate Frazer's distinction between *contagious* magic and *imitative* magic. What is considered as effective in these examples is no longer the similarity, but the association in space, the contiguity, or at least the imagined contiguity, or the memory of its existence. But since similarity and contiguity are the two essential principles of the processes of association of ideas, it must be concluded that the dominance of associations of ideas really explains all the madness of the rules of magic. We can see how true Tylor's quoted characteristic of magic: "mistaking an ideal connection for a real one", proves to be. The same may be said of Frazer's idea, who has expressed it in almost the same terms: "men mistook the order of their ideas for the order of nature, and hence imagined that the control which they have, or seem to have, over their thoughts, permitted them to have a corresponding control over things".

It will at first seem strange that this illuminating explanation of magic could have been rejected by some authors as unsatisfactory. But on closer consideration we must sustain the objection that the association theory of magic merely explains the paths that magic travels, and not its essential nature, that is, it does not explain the misunderstanding which bids it put psychological laws in place of natural ones. We are apparently in need here of a dynamic factor; but while the search for this leads the critics of Frazer's theory astray, it will be easy to give a satisfactory explanation of

magic by carrying its association theory further and by entering more deeply into it.

First let us examine the simpler and more important case of imitative magic. According to Frazer this may be practised by itself, whereas contagious magic as a rule presupposes the imitative. The motives which impel one to exercise magic are easily recognized; they are the wishes of men. We need only assume that primitive man had great confidence in the power of his wishes. At bottom everything which he accomplished by magic means must have been done solely because he wanted it. Thus in the beginning only his wish is accentuated.

In the case of the child which finds itself under analogous psychic conditions, without being as yet capable of motor activity, we have elsewhere advocated the assumption that it at first really satisfies its wishes by means of hallucinations, in that it creates the satisfying situation through centrifugal excitements of its sensory organs. The adult primitive man knows another way. A motor impulse, the will, clings to his wish and this will which later will change the face of the earth in the service of wish fulfilment is now used to represent the gratification so that one may experience it, as it were, through motor hallucination. Such a *representation* of the gratified wish is altogether comparable to the *play* of children, where it replaces the purely sensory technique of gratification. If play and imitative representation suffice for the child and for primitive man, it must not be taken as a sign of modesty, in our sense, or of resignation due to the realization of their impotence, on the contrary; it is the very obvious result of the excessive valuation of their wish, of the will which depends upon the wish and of the paths the wish takes. In time the psychic accent is displaced from the motives of the magic act to its means, namely to the act itself. Perhaps it would be more correct to say that primitive man does not become aware of the over-valuation of his psychic acts until it becomes evident to him through the means employed. It would also seem as if it were the magic act itself which compels the fulfilment of the wish by virtue of its similarity to the object desired. At the stage of animistic thinking there is as yet no way of demonstrating objectively the true state of affairs, but this becomes possible at later stages when, though such procedures are still practised, the psychic phenomenon of scepticism already manifests itself as a tendency to repression. At that stage men will acknowledge that the conjuration of spirits avails nothing unless

accompanied by belief, and that the magic effect of prayer fails if there is no piety behind it.

The possibility of a contagious magic which depends upon contiguous association will then show us that the psychic valuation of the wish and the will has been extended to all psychic acts which the will can command. We may say that at present there is a general over-valuation of all psychic processes, that is to say there is an attitude towards the world which according to our understanding of the relation of reality to thought must appear like an over-estimation of the latter. Objects as such are over-shadowed by the ideas representing them; what takes place in the latter must also happen to the former, and the relations which exist between ideas are also postulated as to things. As thought does not recognize distances and easily brings together in one act of consciousness things spatially and temporally far removed, the magic world also puts itself above spatial distance by telepathy, and treats a past association as if it were a present one. In the animistic age the reflection of the inner world must obscure that other picture of the world which we believe we recognize.

Let us also point out that the two principles of association, similarity and contiguity, meet in the higher unity of contact. Association by contiguity is contact in the direct sense, and association by similarity is contact in the transferred sense. Another identity in the psychic process which has not yet been grasped by us is probably concealed in the use of the same word for both kinds of associations. It is the same range of the concept of contact which we have found in the analysis of taboo.

In summing up we may now say that the principle which controls magic, and the technique of the animistic method of thought, is ‘Omnipotence of Thought’.

3

I have adopted the term ‘Omnipotence of Thought’ from a highly intelligent man, a former sufferer from compulsion neurosis, who, after being cured through psychoanalytic treatment, was able to demonstrate his efficiency and good sense. He had coined this phrase to designate all those peculiar and uncanny occurrences which seemed to pursue him just as they pursue others afflicted with his malady. Thus if he happened to think of a

person, he was actually confronted with this person as if he had conjured him up; if he inquired suddenly about the state of health of an acquaintance whom he had long missed he was sure to hear that this acquaintance had just died, so that he could believe that the deceased had drawn his attention to himself by telepathic means; if he uttered a half meant imprecation against a stranger, he could expect to have him die soon thereafter and burden him with the responsibility for his death. He was able to explain most of these cases in the course of the treatment, he could tell how the illusion had originated, and what he himself had contributed towards furthering his superstitious expectations. All compulsion neurotics are superstitious in this manner and often against their better judgment.

The existence of omnipotence of thought is most clearly seen in compulsion neurosis, where the results of this primitive method of thought are most often found or met in consciousness. But we must guard against seeing in this a distinguishing characteristic of this neurosis, for analytic investigation reveals the same mechanism in the other neuroses. In every one of the neuroses it is not the reality of the experience but the reality of the thought which forms the basis for the symptom formation. Neurotics live in a special world in which, as I have elsewhere expressed it, only the ‘neurotic standard of currency’ counts, that is to say, only things intensively thought of or affectively conceived are effective with them, regardless of whether these things are in harmony with outer reality. The hysteric repeats in his attacks and fixates through his symptoms, occurrences which have taken place only in his phantasy, though in the last analysis they go back to real events or have been built up from them. The neurotic’s guilty conscience is just as incomprehensible if traced to real misdeeds. A compulsion neurotic may be oppressed by a sense of guilt which is appropriate to a wholesale murderer, while at the same time he acts towards his fellow beings in a most considerate and scrupulous manner, a behaviour which he evinced since his childhood. And yet his sense of guilt is justified; it is based upon intensive and frequent death wishes which unconsciously manifest themselves towards his fellow beings. It is motivated from the point of view of unconscious thoughts, but not of intentional acts. Thus the omnipotence of thought, the over-estimation of psychic processes as opposed to reality, proves to be of unlimited effect in the neurotic’s affective life and in all that emanates

from it. But if we subject him to psychoanalytic treatment, which makes his unconscious thoughts conscious to him he refuses to believe that thoughts are free and is always afraid to express evil wishes lest they be fulfilled in consequence of his utterance. But through this attitude as well as through the superstition which plays an active part in his life he reveals to us how close he stands to the savage who believes he can change the outer world by a mere thought of his.

The primary obsessive actions of these neurotics are really altogether of a magical nature. If not magic they are at least anti-magic and are destined to ward off the expectation of evil with which the neurosis is wont to begin. Whenever I was able to pierce these secrets it turned out that the content of this expectation of evil was death. According to Schopenhauer the problem of death stands at the beginning of every philosophy; we have heard that the formation of the soul conception and of the belief in demons which characterize animism, are also traced back to the impression which death makes upon man. It is hard to decide whether these first compulsive and protective actions follow the principle of similarity, or of contrast, for under the conditions of the neurosis they are usually distorted through displacement upon some trifle, upon some action which in itself is quite insignificant. The protective formulæ of the compulsion neurosis also have a counterpart in the incantations of magic. But the evolution of compulsive actions may be described by pointing out how these actions begin as a spell against evil wishes which are very remote from anything sexual, only to end up as a substitute for forbidden sexual activity, which they imitate as faithfully as possible.

If we accept the evolution of man's conceptions of the universe mentioned above, according to which the *animistic* phase is *succeeded* by the *religious*, and this in turn by the *scientific*, we have no difficulty in following the fortunes of the 'omnipotence of thought' through all these phases. In the animistic stage man ascribes omnipotence to himself; in the religious he has ceded it to the gods, but without seriously giving it up, for he reserves to himself the right to control the gods by influencing them in some way or other in the interest of his wishes. In the scientific attitude towards life there is no longer any room for man's omnipotence; he has acknowledged his smallness and has submitted to death as to all other natural necessities in a spirit of resignation. Nevertheless, in our reliance upon the power of the human spirit which copes with the laws of reality,

there still lives on a fragment of this primitive belief in the omnipotence of thought.

In retracing the development of libidinous impulses in the individual from its mature form back to its first beginnings in childhood, we at first found an important distinction which is stated in the *Three Contributions to the Theory of Sex*. The manifestations of sexual impulses can be recognized from the beginning, but at first they are not yet directed to any outer object. Each individual component of the sexual impulse works for a gain in pleasure and finds its gratification in its own body. This stage is called *autoerotism* and is distinguished from the stage of object selection.

In the course of further study it proved to be practical and really necessary to insert a third stage between these two or, if one prefers, to divide the first stage of autoerotism into two. In this intermediary stage, the importance of which increases the more we investigate it, the sexual impulses which formerly were separate, have already formed into a unit and have also found an object; but this object is not external and foreign to the individual, but is his own ego, which is formed at this period. This new stage is called *narcism*, in view of the pathological fixation of this condition which may be observed later on. The individual acts as if he were in love with himself; for the purposes of our analysis the ego impulses and the libidinous wishes cannot yet be separated from each other.

Although this narcistic stage, in which the hitherto dissociated sexual impulses combine into a unity and take the ego as their object, cannot as yet be sharply differentiated, we can already surmise that the narcistic organization is never altogether given up again. To a certain extent man remains narcistic, even after he had found outer subjects for his libido, and the objects on which he bestows it represent, as it were, emanations of the libido which remain with his ego and which can be withdrawn into it. The state of being in love, so remarkable psychologically, and the normal prototype of the psychoses, corresponds to the highest stage of these emanations, in contrast to the state of self-love.

This high estimation of psychic acts found among primitives and neurotics, which we feel to be an overestimation, may now appropriately be brought into relation to narcism, and interpreted as an essential part of it. We would say that among primitive people thinking is still highly sexualized and that this accounts for the belief in the omnipotence of

thought, the unshaken confidence in the capacity to dominate the world and the inaccessibility to the obvious facts which could enlighten man as to his real place in the world. In the case of neurotics a considerable part of this primitive attitude had remained as a constitutional factor, while on the other hand the sexual repression occurring in them has brought about a new sexualization of the processes of thought. In both cases, whether we deal with an original libidinous investment of thought or whether the same process has been accomplished regressively, the psychic results are the same, namely, intellectual narcism and omnipotence of thought.

If we may take the now established omnipotence of thought among primitive races as a proof of their narcism, we may venture to compare the various evolutionary stages of man's conception of the universe with the stages of the libidinous evolution of the individual. We find that the animistic phase corresponds in time as well as in content with narcism, the religious phase corresponds to that stage of object finding which is characterized by dependence on the parents, while the scientific stage has its full counterpart in the individual's stage of maturity where, having renounced the pleasure principle and having adapted himself to reality, he seeks his object in the outer world.

Only in one field has the omnipotence of thought been retained in our own civilization, namely in art. In art alone it still happens that man, consumed by his wishes, produces something similar to the gratification of these wishes, and this playing, thanks to artistic illusion, calls forth effects as if it were something real. We rightly speak of the magic of art and compare the artist with a magician. But this comparison is perhaps more important than it claims to be. Art, which certainly did not begin as art for art's sake, originally served tendencies which to-day have for the greater part ceased to exist. Among these we may suspect various magic intentions.

4

Animism, the first conception of the world which man succeeded in evolving, was therefore psychological. It did not yet require any science to establish it, for science sets in only after we have realized that we do not know the world and that we must therefore seek means of getting to know it. But animism was natural and self-evident to primitive man; he knew

how the things of the world were constituted, and as man conceived himself to be. We are therefore prepared to find that primitive man transferred the structural relations of his own psyche to the outer world, and on the other hand we may make the attempt to transfer back into the human soul what animism teaches about the nature of things.

Magic, the technique of animism, clearly and unmistakably shows the tendency of forcing the laws of psychic life upon the reality of things, under conditions where spirits did not yet have to play any rôle, and could still be taken as objects of magic treatment. The assumptions of magic are therefore of older origin than the spirit theory, which forms the nucleus of animism. Our psychoanalytic view here coincides with a theory of R. R. Marett, according to which animism is preceded by a pre-animistic stage the nature of which is best indicated by the name Animatism (the theory of general animation). We have practically no further knowledge of pre-animism, as no race has yet been found without conceptions of spirits.

While magic still retains the full omnipotence of ideas, animism has ceded part of this omnipotence to spirits and thus has started on the way to form a religion. Now what could have moved primitive man to this first act of renunciation? It could hardly have been an insight into the incorrectness of his assumptions, for he continued to retain the magic technique.

As pointed out elsewhere, spirits and demons were nothing but the projection of primitive man's emotional impulses; he personified the things he endowed with effects, populated the world with them and then rediscovered his inner psychic processes outside himself, quite like the ingenious paranoiac Schreber, who found the fixations and detachments of his libido reflected in the fates of the 'God-rays' which he invented.

As on a former occasion, we want to avoid the problem as to the origin of the tendency to project psychic processes into the outer world. It is fair to assume, however, that this tendency becomes stronger where the projection into the outer world offers psychic relief. Such a state of affairs can with certainty be expected if the impulses struggling for omnipotence have come into conflict with each other, for then they evidently cannot all become omnipotent. The morbid process in paranoia actually uses the mechanism of projection to solve such conflicts which arise in the psychic life. However, it so happens that the model case of such a conflict between two parts of an antithesis is the ambivalent attitude which we have

analysed in detail in the situation of the mourner at the death of one dear to him. Such a case appeals to us especially fitted to motivate the creation of projection formations. Here again we are in agreement with those authors who declare that evil spirits were the first born among spirits, and find the origin of soul conceptions in the impression which death makes upon the survivors. We differ from them only in not putting the intellectual problem which death imposes upon the living into the foreground, instead of which we transfer the force which stimulates inquiry to the conflict of feelings into which this situation plunges the survivor.

The first theoretical accomplishment of man, the creation of spirits would therefore spring from the same source as the first moral restrictions to which he subjects himself, namely, the rules of taboo. But the fact that they have the same source should not prejudice us in favour of a simultaneous origin. If it really were the situation of the survivor confronted by the dead which first caused primitive man to reflect, so that he was compelled to surrender some of his omnipotence to spirits and to sacrifice a part of the free will of his actions, these cultural creations would be a first recognition of the ἀνάγκη, which opposes man's narcism. Primitive man would bow to the superior power of death with the same gesture with which he seems to deny it.

If we have the courage to follow our assumptions further, we may ask what essential part of our psychological structure is reflected and reviewed in the projection formation of souls and spirits. It is then difficult to dispute that the primitive conception of the soul, though still far removed from the later and wholly immaterial soul, nevertheless shares its nature and therefore looks upon a person or a thing as a duality, over the two elements of which the known properties and changes of the whole are distributed. This origin duality, we have borrowed the term from Herbert Spencer, is already identical with the dualism which manifests itself in our customary separation of spirit from body, and whose indestructible linguistic manifestations we recognize, for instance, in the description of a person who faints or raves as one who is 'beside himself.'

The thing which we, just like primitive man, project in outer reality, can hardly be anything else than the recognition of a state in which a given thing is present to the senses and to consciousness, next to which another state exists in which the thing is *latent*, but can reappear, that is to say, the

co-existence of perception and memory, or, to generalize it, the existence of unconscious psychic processes next to conscious ones. It might be said that in the last analysis the ‘spirit’ of a person or thing is the faculty of remembering and representing the object, after he or it was withdrawn from conscious perception.

Of course we must not expect from either the primitive or the current conception of the ‘soul’ that its line of demarcation from other parts should be as marked as that which contemporary science draws between conscious and unconscious psychic activity. The animistic soul, on the contrary, unites determinants from both sides. Its flightiness and mobility, its faculty of leaving the body, of permanently or temporarily taking possession of another body, all these are characteristics which remind us unmistakably of the nature of consciousness. But the way in which it keeps itself concealed behind the personal appearance reminds us of the unconscious; to-day we no longer ascribe its unchangeableness and indestructibility to conscious but to unconscious processes and look upon these as the real bearers of psychic activity.

We said before that animism is a system of thought, the first complete theory of the world; we now want to draw certain inferences through psychoanalytic interpretation of such a system. Our everyday experience is capable of constantly showing us the main characteristics of the ‘system’. We dream during the night and have learnt to interpret the dream in the daytime. The dream can, without being untrue to its nature, appear confused and incoherent; but on the other hand it can also imitate the order of impressions of an experience, infer one occurrence from another, and refer one part of its contents to another. The dream succeeds more or less in this, but hardly ever succeeds so completely that an absurdity or a gap in the structure does not appear somewhere. If we subject the dream to interpretation we find that this unstable and irregular order of its components is quite unimportant for our understanding of it. The essential part of the dream are the dream thoughts, which have, to be sure, a significant, coherent, order. But their order is quite different from that which we remember from the manifest content of the dream. The coherence of the dream thoughts has been abolished and may either remain altogether lost or can be replaced by the new coherence of the dream content. Besides the condensation of the dream elements there is almost regularly a re-grouping of the same which is more or less

independent of the former order. We say in conclusion, that what the dream-work has made out of the material of the dream thoughts has been subjected to a new influence, the so-called secondary elaboration, the object of which evidently is to do away with the incoherence and incomprehensibility caused by the dream-work, in favour of a new ‘meaning’. This new meaning which has been brought about by the secondary elaboration is no longer the meaning of the dream thoughts.

The secondary elaboration of the product of the dream-work is an excellent example of the nature and the pretensions of a system. An intellectual function in us demands the unification, coherence and comprehensibility of everything perceived and thought of, and does not hesitate to construct a false connexion if, as a result of special circumstances, it cannot grasp the right one. We know such system formation not only from the dream, but also from phobias, from compulsive thinking and from the types of delusions. The system formation is most ingenious in delusional states (paranoia) and dominates the clinical picture, but it also must not be overlooked in other forms of neuropsychoses. In every case we can show that a re-arrangement of the psychic material takes place, which may often be quite violent, provided it seems comprehensible from the point of view of the system. The best indication that a system has been formed then lies in the fact that each result of it can be shown to have at least two motivations one of which springs from the assumptions of the system and is therefore eventually delusional, — and a hidden one which, however, we must recognize as the real and effective motivation.

An example from a neurosis may serve as illustration. In the chapter on taboo I mentioned a patient whose compulsive prohibitions correspond very neatly to the taboo of the Maori. The neurosis of this woman was directed against her husband and culminated in the defence against the unconscious wish for his death. But her manifest systematic phobia concerned the mention of death in general, in which her husband was altogether eliminated and never became the object of conscious solicitude. One day she heard her husband give an order to have his dull razors taken to a certain shop to have them sharpened. Impelled by a peculiar unrest she went to the shop herself, and on her return from this reconnoitre she asked her husband to lay the razors aside for good because she had discovered that there was a warehouse of coffins and funeral accessories

next to the shop he mentioned. She claimed that he had intentionally brought the razors into permanent relation with the idea of death. This was then the systematic motivation of the prohibition, but we may be sure that the patient would have brought home the prohibition relating to the razors even if she had not discovered this warehouse in the neighbourhood. For it would have been sufficient if on her way to the shop she had met a hearse, a person in mourning, or somebody carrying a wreath. The net of determinants was spread out far enough to catch the prey in any case, it was simply a question whether she should pull it in or not. It could be established with certainty that she did not mobilize the determinants of the prohibition in other circumstances. She would then have said it had been one of her ‘better days’. The real reason for the prohibition of the razor was, of course, as we can easily guess, her resistance against a pleasurably accentuated idea that her husband might cut his throat with the sharpened razors.

In much the same way a motor inhibition, an abasia or an agoraphobia, becomes perfected and detailed if the symptom once succeeds in representing an unconscious wish and of imposing a defence against it. All the patient’s remaining unconscious phantasies and effective reminiscences strive for symptomatic expression through this outlet, when once it has been opened, and range themselves appropriately in the new order within the sphere of the disturbance of gait. It would therefore be a futile and really foolish way to begin to try to understand the symptomatic structure, and the details of, let us say, an agoraphobia, in terms of its basic assumptions. For the whole logic and strictness of connexion is only apparent. Sharper observation can reveal, as in the formation of the façade in the dream, the greatest inconsistency and arbitrariness in the symptom formation. The details of such a systematic phobia take their real motivation from concealed determinants which must have nothing to do with the inhibition in gait; it is for this reason that the form of such a phobia varies so and is so contradictory in different people.

If we now attempt to retrace the system of animism with which we are concerned, we may conclude from our insight into other psychological systems that ‘superstition’ need not be the only and actual motivation of such a single rule or custom even among primitive races, and that we are not relieved of the obligation of seeking for concealed motives. Under the dominance of an animistic system it is absolutely essential that each rule

and activity should receive a systematic motivation which we to-day call ‘superstitious’. But ‘superstition’, like ‘anxiety’, ‘dreams’, and ‘demons’, is one of the preliminaries of psychology which have been dissipated by psychoanalytic investigation. If we get behind these structures, which like a screen conceal understanding, we realize that the psychic life and the cultural level of savages have hitherto been inadequately appreciated.

If we regard the repression of impulses as a measure of the level of culture attained, we must admit that under the animistic system too, progress and evolution have taken place, which unjustly have been under-estimated on account of their superstitious motivation. If we hear that the warriors of a savage tribe impose the greatest chastity and cleanliness upon themselves as soon as they go upon the war-path, the obvious explanation is that they dispose of their refuse in order that the enemy may not come into possession of this part of their person in order to harm them by magical means, and we may surmise analogous superstitious motivations for their abstinence. Nevertheless the fact remains that the impulse is renounced and we probably understand the case better if we assume that the savage warrior imposes such restrictions upon himself in compensation, because he is on the point of allowing himself the full satisfaction of cruel and hostile impulses otherwise forbidden. The same holds good for the numerous cases of sexual restriction while he is preoccupied with difficult or responsible tasks. Even if the basis of these prohibitions can be referred to some association with magic, the fundamental conception of gaining greater strength by foregoing gratification of desires nevertheless remains unmistakable, and besides the magic rationalization of the prohibition, one must not neglect its hygienic root. When the men of a savage tribe go away to hunt, fish, make war, or collect valuable plants, the women at home are in the meantime subjected to numerous oppressive restrictions which, according to the savages themselves, exert a sympathetic effect upon the success of the far away expedition. But it does not require much acumen to guess that this element acting at a distance is nothing but a thought of home, the longing of the absent, and that these disguises conceal the sound psychological insight that the men will do their best only if they are fully assured of the whereabouts of their guarded women. On other occasions the thought is directly expressed without magic motivation that the conjugal infidelity of the wife thwarts the absent husband’s efforts.

The countless taboo rules to which the women of savages are subject during their menstrual periods are motivated by the superstitious dread of blood which in all probability actually determines it. But it would be wrong to overlook the possibility that this blood dread also serves æsthetic and hygienic purposes which in every case have to be covered by magic motivations.

We are probably not mistaken in assuming that such attempted explanations expose us to the reproach of attributing a most improbable delicacy of psychic activities to contemporary savages.

But I think that we may easily make the same mistake with the psychology of these races who have remained at the animistic stage that we made with the psychic life of the child, which we adults understood no better and whose richness and fineness of feeling we have therefore so greatly undervalued.

I want to consider another group of hitherto unexplained taboo rules because they admit of an explanation with which the psychoanalyst is familiar. Under certain conditions it is forbidden to many savage races to keep in the house sharp weapons and instruments for cutting. Frazer sites a German superstition that a knife must not be left lying with the edge pointing upward because God and the angels might injure themselves with it. May we not recognize in this taboo a premonition of certain ‘symptomatic actions’ for which the sharp weapon might be used by unconscious evil impulses?

CHAPTER IV. THE INFANTILE RECURRENCE OF TOTEMISM

THE reader need not fear that psychoanalysis, which first revealed the regular over-determination of psychic acts and formations, will be tempted to derive anything so complicated as religion from a single source. If it necessarily seeks, as in duty bound, to gain recognition for one of the sources of this institution, it by no means claims exclusiveness for this source or even first rank among the concurring factors. Only a synthesis from various fields of research can decide what relative importance in the genesis of religion is to be assigned to the mechanism which we are to discuss; but such a task exceeds the means as well as the intentions of the psychoanalyst.

1

The first chapter of this book made us acquainted with the conception of totemism. We heard that totemism is a system which takes the place of religion among certain primitive races in Australia, America, and Africa, and furnishes the basis of social organization. We know that in 1869 the Scotchman MacLennan attracted general interest to the phenomena of totemism, which until then had been considered merely as curiosities, by his conjecture that a large number of customs and usages in various old as well as modern societies were to be taken as remnants of a totemic epoch. Science has since then fully recognized this significance of totemism. I quote a passage from the *Elements of the Psychology of Races* by W. Wundt (1912), as the latest utterance on this question: ‘Taking all this together it becomes highly probable that a totemic culture was at one time the preliminary stage of every later evolution as well as a transition stage between the state of primitive man and the age of gods and heroes.’

It is necessary for the purposes of this chapter to go more deeply into the nature of totemism. For reasons that will be evident later I here give preference to an outline by S. Reinach, who in the year 1900 sketched the following *Code du Totémisme* in twelve articles, like a catechism of the totemic religion:

1. Certain animals must not be killed or eaten, but men bring up individual animals of these species and take care of them.

2. An animal that dies accidentally is mourned and buried with the same honours as a member of the tribe.

3. The prohibition as to eating sometimes refers only to a certain part of the animal.

4. If pressure of necessity compels the killing of an animal usually spared, it is done with excuses to the animal and the attempt is made to mitigate the violation of the taboo, namely the killing, through various tricks and evasions.

5. If the animal is sacrificed by ritual, it is solemnly mourned.

6. At specified solemn occasions, like religious ceremonies, the skins of certain animals are donned. Where totemism still exists, these are totem animals.

7. Tribes and individuals assume the names of totem animals.

8. Many tribes use pictures of animals as coats of arms and decorate their weapons with them; the men paint animal pictures on their bodies or have them tattooed.

9. If the totem is one of the feared and dangerous animals it is assumed that the animal will spare the members of the tribe named after it.

10. The totem animal protects and warns the members of the tribe.

11. The totem animal foretells the future to those faithful to it and serves as their leader.

12. The members of a totem tribe often believe that they are connected with the totem animal by the bond of common origin.

The value of this catechism of the totem religion can be more appreciated if one bears in mind that Reinach has here also incorporated all the signs and clews which lead to the conclusion that the totemic system had once existed. The peculiar attitude of this author to the problem is shown by the fact that to some extent he neglects the essential traits of totemism, and we shall see that of the two main tenets of the totemistic catechism he has forced one into the background and completely lost sight of the other.

In order to get a more correct picture of the characteristics of totemism we turn to an author who has devoted four volumes to the theme, combining the most complete collection of the observations in question with the most thorough discussion of the problems they raise. We shall

remain indebted to J. G. Frazer, the author of *Totemism and Exogamy*, for the pleasure and information he affords, even though psychoanalytic investigation may lead us to results which differ widely from his.

"A totem," wrote Frazer in his first essay, "is a class of material objects which a savage regards with superstitious respect, believing that there exists between him and every member of the class an intimate and altogether special relation. The connexion between a person and his totem is mutually beneficent; the totem protects the man and the man shows his respect for the totem in various ways, by not killing it if it be an animal, and not cutting or gathering it if it be a plant. As distinguished from a fetich, a totem is never an isolated individual but always a class of objects, generally a species of animals or of plants, more rarely a class of inanimate natural objects, very rarely a class of artificial objects."

At least three kinds of totem can be distinguished:

1. The tribal totem which a whole tribe shares and which is hereditary from generation to generation,

2. The sex totem which belongs to all the masculine or feminine members of a tribe to the exclusion of the opposite sex, and

3. The individual totem which belongs to the individual and does not descend to his successors.

The last two kinds of totem are comparatively of little importance compared to the tribal totem. Unless we are mistaken they are recent formations and of little importance as far as the nature of the taboo is concerned.

The tribal totem (clan totem) is the object of veneration of a group of men and women who take their name from the totem and consider themselves consanguineous offspring of a common ancestor, and who are firmly associated with each other through common obligations towards each other as well as by the belief in their totem.

Totemism is a religious as well as a social system. On its religious side it consists of the relations of mutual respect and consideration between a person and his totem, and on its social side it is composed of obligations of the members of the clan towards each other and towards other tribes. In the later history of totemism these two sides show a tendency to part company; the social system often survives the religious and conversely remnants of totemism remain in the religion of countries in which the social system based upon totemism had disappeared. In the present state of

our ignorance about the origin of totemism we cannot say with certainty how these two sides were originally combined. But there is on the whole a strong probability that in the beginning the two sides of totemism were indistinguishable from each other. In other words, the further we go back the clearer it becomes that a member of a tribe looks upon himself as being of the same genus as his totem and makes no distinction between his attitude towards the totem and his attitude towards his tribal companions.

In the special description of totemism as a religious system, Frazer lays stress on the fact that the members of a tribe assume the name of their totem and also as a *rule believe that they are descended from it.* It is due to this belief that they do not hunt the totem animal or kill or eat it, and that they deny themselves every other use of the totem if it is not an animal. The prohibitions against killing or eating the totem are not the only taboos affecting it; sometimes it is also forbidden to touch it and even to look at it; in a number of cases the totem must not be called by its right name. Violation of the taboo prohibitions which protect the totem is punished automatically by serious disease or death.

Specimens of the totem animals are sometimes raised by the clan and taken care of in captivity. A totem animal found dead is mourned and buried like a member of the clan. If a totem animal had to be killed it was done with a prescribed ritual of excuses and ceremonies of expiation.

The tribe expected protection and forbearance from its totem. If it was a dangerous animal (a beast of prey or a poisonous snake), it was assumed that it would not harm, and where this assumption did not come true the person attacked was expelled from the tribe. Frazer thinks that oaths were originally ordeals, many tests as to descent and genuineness being in this way left to the decision of the totem. The totem helps in case of illness and gives the tribe premonitions and warnings. The appearance of the totem animal near a house was often looked upon as an announcement of death. The totem had come to get its relative.

A member of a clan seeks to emphasize his relationship to the totem in various significant ways; he imitates an exterior similarity by dressing himself in the skin of the totem animal, by having the picture of it tattooed upon himself, and in other ways. On the solemn occasions of birth, initiation into manhood or funeral obsequies this identification with the totem is carried out in deeds and words. Dances in which all the members of the tribe disguise themselves as their totem and act like it, serve various

magic and religious purposes. Finally there are the ceremonies at which the totem animal is killed in a solemn manner.

The social side of totemism is primarily expressed in a sternly observed commandment and in a tremendous restriction. The members of a totem clan are brothers and sisters, pledged to help and protect each other; if a member of the clan is slain by a stranger the whole tribe of the slayer must answer for the murder and the clan of the slain man shows its solidarity in the demand for expiation for the blood that has been shed. The ties of the totem are stronger than our ideas of family ties, with which they do not altogether coincide, since the transfer of the totem takes place as a rule through maternal inheritance, paternal inheritance possibly not counting at all in the beginning.

But the corresponding taboo restriction consists in the prohibition against members of the same clan marrying each other or having any kind of sexual intercourse whatsoever with each other. This is the famous and enigmatic *exogamy* connexion with totemism. We have devoted the whole first chapter of this book to it, and therefore need only mention here that this exogamy springs from the intensified incest dread of primitive races, that it becomes entirely comprehensible as a security against incest in group marriages, and that at first it accomplishes the avoidance of incest for the younger generation and only in the course of further development becomes a hindrance to the older generation as well.

To this presentation of totemism by Frazer, one of the earliest in the literature on the subject, I will now add a few excerpts from one of the latest summaries. In the *Elements of the Psychology of Races*, which appeared in 1912, W. Wundt says: “The totem animal is considered the ancestral animal. ‘Totem’ is therefore both a group name and a birth name and in the latter aspect this name has at the same time a mythological meaning. But all these uses of the conception play into each other and the particular meanings may recede so that in some cases the totems have become almost a mere nomenclature of the tribal divisions, while in others the idea of the descent or else the cultic meaning of the totem remains in the foreground.... The conception of the totem determines the *tribal* arrangement and the *tribal organization*. These norms and their establishment in the belief and feelings of the members of the tribe account for the fact that originally the totem animal was certainly not considered merely a name for a group division but that it usually was

considered the progenitor of the corresponding division.... This accounted for the fact that these animal ancestors enjoyed a cult.... This animal cult expresses itself primarily in the attitude towards the totem animal, quite aside from special ceremonies and ceremonial festivities: not only each individual animal but every representative of the same species was to a certain degree a sanctified animal; the member of the totem was forbidden to eat the flesh of the totem animal or he was allowed to eat it only under special circumstances. This is in accord with the significant contradictory phenomenon found in this connexion, namely, that under certain conditions there was a kind of ceremonial consumption of the totem flesh....”

“ ...But the most important social side of this totemic tribal arrangement consists in the fact that it was connected with certain rules of conduct for the relations of the groups with each other. The most important of these were the rules of conjugal relations. This tribal division is thus connected with an important phenomenon which first made its appearance in the totemic age, namely with exogamy.”

If we wish to arrive at the characteristics of the original totemism by sifting through everything that may correspond to later development or decline, we find the following essential facts: *The totems were originally only animals and were considered the ancestors of single tribes. The totem was hereditary only through the female line; it was forbidden to kill the totem* (or to eat it, which under primitive conditions amounts to the same thing); *members of a totem were forbidden to have sexual intercourse with each other*.

It may now seem strange to us that in the *Code du totémisme* which Reinach has drawn up the one principal taboo, namely exogamy, does not appear at all while the assumption of the second taboo, namely the descent from the totem animal, is only casually mentioned. Yet Reinach is an author to whose work in this field we owe much and I have chosen his presentation in order to prepare us for the differences of opinion among the authors, which will now occupy our attention.

2

The more convinced we became that totemism had regularly formed a phase of every culture, the more urgent became the necessity of arriving at

an understanding of it and of casting light upon the riddle of its nature. To be sure, everything about totemism is in the nature of a riddle; the decisive questions are the origin of the totem, the motivation of exogamy (or rather of the incest taboo which it represents) and the relation between the two, the totem organization and the incest prohibition. The understanding should be at once historical and psychological; it should inform us under what conditions this peculiar institution developed and to what psychic needs of man it has given expression.

The reader will certainly be astonished to hear from how many different points of view the answer to these questions has been attempted and how far the opinions of expert investigators vary. Almost everything that might be asserted in general about totemism is doubtful; even the above statement of it, taken from an article by Frazer in 1887, cannot escape the criticism that it expresses an arbitrary preference of the author and would be challenged to-day by Frazer himself, who has repeatedly changed his view on the subject.

It is quite obvious that the nature of totemism and exogamy could be most readily grasped if we could get into closer touch with the origin of both institutions. But in judging the state of affairs we must not forget the remark of Andrew Lang, that even primitive races have not preserved these original forms and the conditions of their origin, so that we are altogether dependent upon hypotheses to take the place of the observation we lack. Among the attempted explanations some seem inadequate from the very beginning in the judgment of the psychologist. They are altogether too rational and do not take into consideration the effective character of what they are to explain. Others rest on assumptions which observation fails to verify; while still others appeal to facts which could better be subjected to another interpretation. The refutation of these various opinions as a rule hardly presents any difficulties; the authors are, as usual, stronger in the criticism which they practice on each other than in their own work. The final result as regards most of the points treated is a *non liquet*. It is therefore not surprising that most of the new literature on the subject, which we have largely omitted here, shows the unmistakable effort to reject a general solution of totemic problems as unfeasible. (See, for instance, B. Goldenweiser in the *Journal of American Folklore* XXIII, 1910. Reviewed in the *Brittanica Year Book*, 1913.) I have taken the

liberty of disregarding the chronological order in stating these contradictory hypotheses.

(a) The Origin of Totemism

The question of the origin of totemism can also be formulated as follows: How did primitive people come to select the names of animals, plants and inanimate objects for themselves and their tribes?

The Scotchman, MacLennan, who discovered totemism and exogamy for science, refrained from publishing his views of the origin of totemism. According to a communication of Andrew Lang he was for a time inclined to trace totemism back to the custom of tattooing. I shall divide the accepted theories of the derivation of totemism into three groups, (α) nominalistic, β) sociological, (γ) psychological.

(α) The Nominalistic Theories

The information about these theories will justify their summation under the headings I have used.

Garcilaso de La Vega, a descendant of the Peruvian Inkas, who wrote the history of his race in the seventeenth century, is already said to have traced back what was known to him about totemic phenomena to the need of the tribes to differentiate themselves from each other by means of names. The same idea appears centuries later in the *Ethnology* of A. K. Keane where totems are said to be derived from heraldic badges through which individuals, families and tribes wanted to differentiate themselves.

Max Müller expresses the same opinion about the meaning of the totem in his *Contributions to the Science of Mythology*. A totem is said to be, 1. a mark of the clan, 2. a clan name, 3. the name of the ancestor of the clan, 4. the name of the object which the clan reveres. J. Pikler wrote later, in 1899, that men needed a permanent name for communities and individuals that could be preserved in writing.... Thus totemism arises, not from a religious, but from a prosaic everyday need of mankind. The giving of names, which is the essence of totemism, is a result of the technique of primitive writing. The totem is of the nature of an easily represented writing symbol. But if savages first bore the name of an animal they deduced the idea of relationship from this animal.

Herbert Spencer, also, thought that the origin of totemism was to be found in the giving of names. The attributes of certain individuals, he showed, had brought about their being named after animals so that they had come to have names of honour or nicknames which continued in their descendants. As a result of the indefiniteness and incomprehensibility of primitive languages, these names are said to have been taken by later generations as proof of their descent from the animals themselves. Totemism would thus be the result of a mistaken reverence for ancestors.

Lord Avebury (better known under his former name, Sir John Lubbock) has expressed himself quite similarly about the origin of totemism, though without emphasizing the misunderstanding. If we want to explain the veneration of animals we must not forget how often human names are borrowed from animals. The children and followers of a man who was called bear or lion naturally made this their ancestral name. In this way it

came about that the animal itself came to be respected and finally venerated.

Fison has advanced what seems an irrefutable objection to such a derivation of the totem name from the names of individuals. He shows from conditions in Australia that the totem is always the mark of a group of people and never of an individual. But if it were otherwise, if the totem was originally the name of a single individual, it could never, with the system of maternal inheritance, descend to his children.

The theories thus far stated are evidently inadequate. They may explain how animal names came to be applied to primitive tribes but they can never explain the importance attached to the giving of names which constitutes the totemic system. The most noteworthy theory of this group has been developed by Andrew Lang in his books, *Social Origins*, 1903, and *The Secret of the Totem*, 1905. This theory still makes naming the centre of the problem, but it uses two interesting psychological factors and thus may claim to have contributed to the final solution of the riddle of totemism.

Andrew Lang holds that it does not make any difference how clans acquired their animal names. It might be assumed that one day they awoke to the consciousness that they had them without being able to account from where they came. *The origin of these names had been forgotten.* In that case they would seek to acquire more information by pondering over their names, and with their conviction of the importance of names they necessarily came to all the ideas that are contained in the totemic system. For primitive men, as for savages of to-day and even for our children, a name is not indifferent and conventional as it seems to us, but is something important and essential. A man’s name is one of the main constituents of his person and perhaps a part of his psyche. The fact that they had the same names as animals must have led primitive men to assume a secret and important bond between their persons and the particular animal species. What other bond than consanguinity could it be? But if the similarity of names once led to this assumption it could also account directly for all the totemic prohibitions of the blood taboo, including exogamy.

“No more than these three things — a group animal name of unknown origin; belief in a transcendental connexion between all bearers, human and bestial, of the same name; and belief in the blood superstitions —

were needed to give rise to all the totemic creeds and practices, including exogamy" (*Secret of the Totem*,).

Lang's explanation extends over two periods. It derives the totemic system of psychological necessity from the totem names, on the assumption that the origin of the naming has been forgotten. The other part of the theory now seeks to clear up the origin of these names. We shall see that it bears an entirely different stamp.

This other part of the Lang theory is not markedly different from those which I have called 'nominalistic'. The practical need of differentiation compelled the individual tribes to assume names and therefore they tolerated the names which every tribe ascribed to the other. This 'naming from without' is the peculiarity of Lang's construction. The fact that the names which thus originated were borrowed from animals is not further remarkable and need not have been felt by primitive men as abuse or derision. Besides, Lang has cited numerous cases from later epochs of history in which names given from without that were first meant to be derisive were accepted by those nicknamed and voluntarily borne (The Guises, Whigs and Tories). The assumption that the origin of these names was forgotten in the course of time connects this second part of the Lang theory with the first one just mentioned.

(β) The Sociological Theories

S. Reinach, who successfully traced the relics of the totemic system in the cult and customs of later periods, though attaching from the very beginning only slight value to the factor of descent from the totem animal, once made the casual remark that totemism seemed to him to be nothing but "*une hypertrophie de l'instinct social*."

The same interpretation seems to permeate the new work of E. Durkheim, *Les Formes Élémentaires de la Vie Religieuse; Le Systême Totémique en Australie*, 1912. The totem is the visible representative of the social religion of these races. It embodies the community, which is the real object of veneration.

Other authors have sought a more intimate reason for the share which social impulses have played in the formation of totemic institutions. Thus A. C. Haddon has assumed that every primitive tribe originally lived on a particular plant or animal species and perhaps also traded with this food and exchanged it with other tribes. It then was inevitable that a tribe should become known to other tribes by the name of the animal which played such weighty rôle with it. At the same time this tribe would develop a special familiarity with this animal, and a kind of interest for it which, however, was based upon the psychic motive of man's most elementary and pressing need, namely, hunger.

The objections against this most rational of all the totem theories are that such a state of the food supply is never found among primitive men and probably never existed. Savages are the more omnivorous the lower they stand in the social scale. Besides, it is incomprehensible how such an exclusive diet could have developed an almost religious relation to the totem, culminating in an absolute abstention from the referred food.

The first of the three theories about the origin of totemism which Frazer stated was a psychological one. We shall report it elsewhere.

Frazer's second theory, which we will discuss here, originated under the influence of an important publication by two investigators of the inhabitants of Central Australia.

Spencer and Gillen describe a series of peculiar institutions, customs, and opinions of a group of tribes, the so-called Arunta nation, and Frazer subscribes to their opinion that these peculiarities are to be looked upon as

characteristics of a primary state and that they can explain the first and real meaning of totemism.

In the Arunta tribe itself (a part of the Arunta nation) these peculiarities are as follows:

1. They have the division into totem clans but the totem is not hereditary but is individually determined (as will be shown later).

2. The totem clans are not exogamous, and the marriage restrictions are brought about by a highly developed division into marriage classes which have nothing to do with the totems.

3. The function of the totem clan consists of carrying out a ceremony which in a subtle magic manner brings about an increase of the edible totem. (This ceremony is called *Intichiuma*.)

4. The Aruntas have a peculiar theory about conception and re-birth. They assume that the spirits of the dead who belonged to their totem wait for their re-birth in definite localities and penetrate into the bodies of the women who pass such a spot. When a child is born the mother states at which spirit abode she thinks she conceived her child. This determines the totem of the child. It is further assumed that the spirits (of the dead as well as of the re-born) are bound to peculiar stone amulets, called *Churinga*, which are found in these places.

Two factors seem to have induced Frazer to believe that the oldest form of totemism had been found in the institution of the Aruntas. In the first place the existence of certain myths which assert that the ancestors of the Aruntas always lived on their totem animal, and that they married no other women except those of their own totem. Secondly, the apparent disregard of the sexual act in their theory of conception. People who have not yet realized that conception was the result of the sexual act might well be considered the most backward and primitive people living to-day.

Frazer, in having recourse to the *Intichiuma* ceremony to explain totemism, suddenly saw the totemic system in a totally different light as a thoroughly practical organization for accomplishing the most natural needs of man. (Compare Haddon above.) The system was simply an extraordinary piece of ‘co-operative magic’. Primitive men formed what might be called a magic production and consumption club. Each totem clan undertook to see to the cleanliness of a certain article of food. If it were a question of inedible totems like harmful animals, rain, wind, or similar objects, it was the duty of the totem clan to dominate this part of

nature and to ward off its injuriousness. The efforts of each clan were for the good of all the others. As the clan could not eat its totem or could eat only a very little of it, it furnished this valuable product for the rest and was in turn furnished with what these had to take care of as their social totem duty. In the light of this interpretation furnished by the *Intichiuma* ceremony, it appeared to Frazer as if the prohibition against eating the totem had misled observers to neglect the more important side of the relation, namely the commandment to supply as much as possible of the edible totem for the needs of others.

Frazer accepted the tradition of the Aruntas that each totem clan had originally lived on its totem without any restriction. It then became difficult to understand the evolution that followed through which savages were satisfied to ensure the totem for others while they themselves abstained from eating it. He then assumed that this restriction was by no means the result of a kind of religious respect, but came about through the observation that no animal devoured its own kind, so that this break in the identification with the totem was injurious to the power which savages sought to acquire over the totem. Or else it resulted from the endeavour to make the being favourably disposed by sparing it. Frazer did not conceal the difficulties of this explanation from himself, nor did he dare to indicate in what way the habit of marrying within the totem, which the myths of the Aruntas proclaimed, was converted into exogamy.

Frazer's theory based on the *Intichiuma*, stands or falls with the recognition of the primitive nature of the Arunta institutions. But it seems impossible to hold to this in the fact of the objections advanced by Durkheim and Lang. The Aruntas seem on the contrary to be the most developed of the Australian tribes and to represent rather a dissolution stage of totemism than its beginning. The myths that made such an impression on Frazer because they emphasize, in contrast to prevailing institutions of to-day, that the Aruntas are free to eat the totem and to marry within it, easily explain themselves to us as wish phantasies, which are projected into the past, like the myths of the Golden Age.

(γ) The Psychological Theories

Frazer's first psychological theories, formed before his acquaintance with the observations of Spencer and Gillen, were based upon the belief in an 'outward soul'. The totem was meant to represent a safe place of refuge where the soul is deposited in order to avoid the dangers which threaten it. After primitive man had housed his soul in his totem he himself became invulnerable and he naturally took care himself not to harm the bearer of his soul. But as he did not know which individual of the species in question was the bearer of his soul he was concerned in sparing the whole species. Frazer himself later gave up this derivation of totemism from the belief in souls.

When he became acquainted with the observations of Spencer and Gillen he set up the other social theory which has just been stated, but he himself then saw that the motive from which he had derived totemism was altogether too 'rational' and that he had assumed a social organization for it which was altogether too complicated to be called primitive. The magic co-operative companies now appeared to him rather as the fruit than as the germ of totemism. He sought a simpler factor for the derivation of totemism in the shape of a primitive superstition behind these forms. He then found this original factor in the remarkable conception theory of the Aruntas.

As already stated, the Aruntas establish no connexion between conception and the sexual act. If a woman feels herself to be a mother it means that at that moment one of the spirits from the nearest spirit abode who has been watching for a re-birth, has penetrated into her body and is born as her child. This child has the same totem as all the spirits that lurk in that particular locality. But if we are willing to go back a step further and assume that the woman originally believed that the animal, plant, stone, or other object which occupied her fancy at the moment when she first felt herself pregnant had really penetrated into her and was being born through her in human form, then the identity of a human being with his totem would really be founded on the belief of the mother, and all the other totem commandments (with the exception of exogamy) could easily be derived from this belief. Men would refuse to eat the particular animal or plant because it would be just like eating themselves. But occasionally

they would be impelled to eat some of their totem in a ceremonial manner because they could thus strengthen their identification with the totem, which is the essential part of totemism. W. H. R. Rivers' observations among the inhabitants of the Bank Islands seemed to prove men's direct identification with their totems on the basis of such a conception theory.

The ultimate sources of totemism would then be the ignorance of savages as to the process of procreation among human beings and animals; especially their ignorance as to the rôle which the male plays in fertilization. This ignorance must be facilitated by the long interval which is interposed between the fertilizing act and the birth of the child or the sensation of the child's first movements. Totemism is therefore a creation of the feminine mind and not of the masculine. The sick fancies of the pregnant woman are the roots of it. Anything indeed that struck a woman at that mysterious moment of her life when she first knows herself to be a mother might easily be identified by her with the child in her womb. Such maternal fancies, so natural and seemingly so universal, appear to be the root of totemism.

The main objection to this third theory of Frazer's is the same which has already been advanced against his second, sociological theory. The Aruntas seem to be far removed from the beginnings of totemism. Their denial of fatherhood does not apparently rest upon primitive ignorance; in many cases they even have paternal inheritance. They seem to have sacrificed fatherhood to a kind of a speculation which strives to honour the ancestral spirits. Though they raise the myth of immaculate conception through a spirit to a general theory of conception, we cannot for that reason credit them with ignorance as to the conditions of procreation any more than we could the old races who lived during the rise of the Christian myths.

Another psychological theory of the origin of totemism has been formulated by the Dutch writer, G. A. Wilcken. It establishes a connexion between totemism and the migration of souls. "The animal into which, according to general belief, the souls of the dead passed, became a blood relative, an ancestor, and was revered as such." But the belief in the soul's migration to animals is more readily derived from totemism than inversely.

Still another theory of totemism is advanced by the excellent American ethnologists, Franz Boas, Hill-Tout, and others. It is based on observations

of totemic Indian tribes and asserts that the totem is originally the guardian spirit of an ancestor who has acquired it through a dream and handed it on to his descendants. We have already heard the difficulties which the derivation of totemism through inheritance from a single individual offers; besides, the Australian observations seem by no means to support the tracing back of the totem to the guardian spirit.

Two facts have become decisive for the last of the psychological theories as stated by Wundt; in the first place, that the original and most widely known totem object was an animal, and secondly, that the earliest totem animals corresponded to animals which had a soul. Such animals as birds, snakes, lizards, mice are fitted by their extreme mobility, their flight through the air, and by other characteristics which arouse surprise and fear, to become the bearers of souls which leave their bodies. The totem animal is a descendant of the animal transformations of the spirit-soul. Thus with Wundt totemism is directly connected with the belief in souls or with animism.

(b) and (c) The Origin of Exogamy and Its Relation to Totemism

I have put forth the theories of totemism with considerable detail and yet I am afraid that I have not made them clear enough on account of the condensation that was constantly necessary. In the interest of the reader I am taking the liberty of further condensing the other questions that arise. The discussions about the exogamy of totem races become especially complicated and untractable, one might even say confused, on account of the nature of the material used. Fortunately the object of this treatise permits me to limit myself to pointing out several guide-posts and referring to the frequently quoted writings of experts in the field for a more thorough pursuit of the subject.

The attitude of an author to the problems of exogamy is of course not independent of the stand he has taken toward one or the other of the totem theories. Some of these explanations of totemism lack all connexion with exogamy so that the two institutions are entirely separated. Thus we find here two opposing views, one of which clings to the original likelihood that exogamy is an essential part of the totemic system while the other disputes such a connection and believes in an accidental combination of these two traits of the most ancient cultures. In his later works Frazer has emphatically stood for this latter point of view.

"I must request the reader to bear constantly in mind that the two institutions of totemism and exogamy are fundamentally distinct in origin and nature though they have accidentally crossed and blended in many tribes." (*Totemism and Exogamy* I, Preface XII.)

He warns directly against the opposite view as being a source of endless difficulties and misunderstandings. In contrast to this, many authors have found a way of conceiving exogamy as a necessary consequence of the basic views on totemism. Durkheim has shown in his writings how the taboo, which is attached to the totem, must have entailed the prohibition against putting a woman of the same totem to sexual uses. The totem is of the same blood as the human being and for this reason the blood bann (in reference to defloration and menstruation) forbids sexual intercourse with a woman of the same totem. Andrew Lang, who here agrees with Durkheim, goes so far as to believe that the blood taboo was not necessary

to bring about the prohibition in regard to the women of the same tribe. The general totem taboo which, for instance, forbids any one to sit in the shadow of the totem tree, would have sufficed. Andrew Lang also contends for another derivation of exogamy (see below) and leaves it in doubt how these two explanations are related to each other.

As regards the temporal relations, the majority of authors subscribe to the opinion that totemism is the older institution and that exogamy came later.

Among the theories which seek to explain exogamy independently of totemism only a few need be mentioned in so far as they illustrate different attitudes of the authors towards the problem of incest.

MacLennan had ingeniously guessed that exogamy resulted from the remnants of customs pointing to earlier forms of female rape. He assumed that it was the general custom in ancient times to procure women from strange tribes so that marriage with a woman from the same tribe gradually became “improper because it was unusual”. He sought the motive for the exogamous habit in the scarcity of women among these tribes, which had resulted from the custom of killing most female children at birth. We are not concerned here with investigation whether actual conditions corroborate MacLennan’s assumptions. We are more interested in the argument that these premises still leave it unexplained why the male members of the tribe should have made these few women of their blood inaccessible to themselves, as well as in the manner in which the incest problem is here entirely neglected.

Other writers have on the contrary assumed, and evidently with more right, that exogamy is to be interpreted as an institution for the prevention of incest.

If we survey the gradually increasing complication of Australian marriage restrictions we can hardly help agreeing with the opinion of Morgan Frazer, Hewitt and Baldwin Spencer, that these institutions bear the stamp of ‘deliberate design’, as Frazer puts it, and that they were meant to do what they have actually accomplished. “In no other way does it seem possible to explain in all its details a system at once so complex and so regular”.

It is of interest to point out that the first restrictions which the introduction of marriage classes brought about affected the sexual freedom of the younger generation, in other words, incest between brothers and

sisters and between sons and mothers, while incest between father and daughter was only abrogated by more sweeping measures.

However, to trace back exogamous sexual restrictions to legal intentions does not add anything to the understanding of the motive which created these institutions. From what source, in the final analysis, springs the dread of incest which must be recognized as the root of exogamy? It evidently does not suffice to appeal to an instinctive aversion against sexual intercourse with blood relatives, that is to say, to the fact of incest dread, in order to explain the dread of incest, if social experience shows that, in spite of this instinct, incest is not a rare occurrence even in our society, and if the experience of history can acquaint us with cases in which incestuous marriage of privileged persons was made the rule.

Westermarck advanced the following to explain the dread of incest: "that an innate aversion against sexual intercourse exists between persons who live together from childhood and that this feeling, since such persons are as a rule consanguineous, finds a natural expression in custom and law through the abhorrence of sexual intercourse between those closely related." Though Havelock Ellis disputed the instinctive character of this aversion in the *Studies in the Psychology of Sex*, he otherwise supported the same explanation in its essentials by declaring: "The normal absence of the manifestation of the pairing instinct where brothers and sisters or boys and girls living together from childhood are concerned, is a purely negative phenomenon due to the fact that under these circumstances the antecedent conditions for arousing the mating instinct must be entirely lacking.... For persons who have grown up together from childhood habit has dulled the sensual attraction of seeing, hearing and touching and has led it into a channel of quiet attachment, robbing it of its power to call forth the necessary erethistic excitement required to produce sexual tumescence."

It seems to me very remarkable that Westermarck looks upon this innate aversion to sexual intercourse with persons with whom we have shared childhood as being at the same time a psychic representative of the biological fact that inbreeding means injury to the species. Such a biological instinct would hardly go so far astray in its psychological manifestation as to affect the companions of home and hearth which in this respect are quite harmless, instead of the blood relatives which alone are injurious to procreation. And I cannot resist citing the excellent

criticism which Frazer opposes to Westermarck's assertion. Frazer finds it incomprehensible that sexual sensibility to-day is not at all opposed to sexual intercourse with companions of the hearth and home while the dread of incest, which is said to be nothing but an offshoot of this reluctance, has nowadays grown to be so overpowering. But other remarks of Frazer's go deeper and I set them down here in unabbreviated form because they are in essential agreement with the arguments developed in my chapter on taboo.

"It is not easy to see why any deep human instinct should need reinforcement through law. There is no law commanding men to eat and drink, or forbidding them to put their hands in the fire. Men eat and drink and keep their hands out of the fire instinctively, for fear of natural, not legal penalties, which would be entailed by violence done to these instincts. The law only forbids men to do what their instincts incline them to do; what nature itself prohibits and punishes it would be superfluous for the law to prohibit and punish. Accordingly we may always safely assume that crimes forbidden by law are crimes which many men have a natural propensity to commit. If there were no such propensity there would be no such crimes, and if no such crimes were committed, what need to forbid them? Instead of assuming therefore, from the legal prohibition of incest, that there is a natural aversion to incest we ought rather to assume that there is a natural instinct in favour of it, and that if the law represses it, it does so because civilized men have come to the conclusion that the satisfaction of these natural instincts is detrimental to the general interests of society".

To this valuable argument of Frazer's I can add that the experiences of psychoanalysis make the assumption of such an innate aversion to incestuous relations altogether impossible. They have taught, on the contrary, that the first sexual impulses of the young are regularly of an incestuous nature and that such repressed impulses play a rôle which can hardly be overestimated as the motive power of later neuroses.

The interpretation of incest dread as an innate instinct must therefore be abandoned. The same holds true of another derivation of the incest prohibition which counts many supporters, namely the assumption that primitive races very soon observed the dangers with which inbreeding threatened their race and that they therefore had decreed the incest prohibition with a conscious purpose. The objections to this attempted

explanation crowd upon each other. Not only must the prohibition of incest be older than all breeding of domestic animals from which men could derive experience of the effect of inbreeding upon the characteristics of the breed, but the harmful consequences of inbreeding are not established beyond all doubt even to-day and in man they can be shown only with difficulty. Besides, everything that we know about contemporaneous savages makes it very improbable that the thoughts of their far-removed ancestors should already have been occupied with preventing injury to their later descendants. It sounds almost ridiculous to attribute hygienic and eugenic motives such as have hardly yet found consideration in our culture, to these children of the race who lived without thought of the morrow.

And finally it must be pointed out that a prohibition against inbreeding as an element weakening to the race, which is imposed from practical hygienic motives, seems quite inadequate to explain the deep abhorrence which our society feels against incest. This dread of incest, as I have shown elsewhere, seems to be even more active and stronger among primitive races living to-day than among the civilized.

In inquiring into the origin of incest dread it could be expected that here also there is the choice between possible explanations of a sociological, biological, and psychological nature in which the psychological motives might have to be considered as representative of biological forces. Still, in the end, one is compelled to subscribe to Frazer’s resigned statement, namely, that we do not know the origin of incest dread and do not even know how to guess at it. None of the solutions of the riddle thus far advanced seems satisfactory to us.

I must mention another attempt to explain the origin of incest dread which is of an entirely different nature from those considered up to now. It might be called an historic explanation.

This attempt is associated with a hypothesis of Charles Darwin about the primal social state of man. From the habits of the higher apes Darwin concluded that man, too, lived originally in small hordes in which the jealousy of the oldest and strongest male prevented sexual promiscuity. “We may indeed conclude from what we know of the jealousy of all male quadrupeds, armed, as many of them are, with special weapons for battling with their rivals, that promiscuous intercourse in a state of nature is extremely improbable.... If we therefore look back far enough into the

stream of time and judging from the social habits of man as he now exists, the most probable view is that he originally lived in small communities, each with a single wife, or if powerful with several, whom he jealously defended against all other men. Or he may not have been a social animal and yet have lived with several wives, like the gorilla; for all the natives agree that only the adult male is seen in a band; when the young male grows up a contest takes place for mastery, and the strongest, by killing and driving out the others, establishes himself as the head of the community (Dr Savage in the Boston *Journal of Natural History*, Vol. V, 1845-7). The younger males being thus driven out and wandering about would also, when at last successful in finding a partner, prevent too close breeding within the limits of the same family".

Atkinson seems to have been the first to recognize that these conditions of the Darwinian primal horde would in practice bring about the exogamy of the young men. Each one of those driven away could found a similar horde in which, thanks to jealousy of the chief, the same prohibition as to sexual intercourse obtained, and in the course of time these conditions would have brought about the rule which is now known as law: no sexual intercourse with the members of the horde. After the advent of totemism the rule would have changed into a different form: no sexual intercourse within the totem.

Andrew Lang declared himself in agreement with this explanation of exogamy. But in the same book he advocates the other theory of Durkheim which explains exogamy as a consequence of the totem laws. It is not altogether easy to combine the two interpretations; in the first case exogamy would have existed before totemism; in the second case it would be a consequence of it.

3

Into this darkness psychoanalytic experience throws one single ray of light.

The relation of the child to animals has much in common with that of primitive man. The child does not yet show any trace of the pride which afterwards moves the adult civilized man to set a sharp dividing line between his own nature and that of all other animals. The child unhesitatingly attributes full equality to animals; he probably feels

himself more closely related to the animal than to the undoubtedly mysterious adult, in the freedom with which he acknowledges his needs.

Not infrequently a curious disturbance manifests itself in this excellent understanding between child and animal. The child suddenly begins to fear a certain animal species and to protect himself against seeing or touching any individual of this species. There results the clinical picture of *animal phobia*, which is one of the most frequent among the psychoneurotic diseases of this age and perhaps the earliest form of such an ailment. The phobia is as a rule in regard to animals for which the child has until then shown the liveliest interest and has nothing to do with the individual animal. In cities the choice of animals which can become the object of phobia is not great. They are horses, dogs, cats, more seldom birds, and strikingly often very small animals like bugs and butterflies. Sometimes animals which are known to the child only from picture books and fairy stories become objects of the senseless and inordinate anxiety which is manifested with these phobias; it is seldom possible to learn the manner in which such an unusual choice of anxiety has been brought about. I am indebted to Dr Karl Abraham for the report of a case in which the child itself explained its fear of wasps by saying that the colour and the stripes of the body of the wasp had made it think of the tiger of which, from all that it had heard, it might well be afraid.

The animal phobias have not yet been made the object of careful analytical investigation, although they very much merit it. The difficulties of analysing children of so tender an age have probably been the motive of such neglect. It cannot therefore be asserted that the general meaning of these illnesses is known, and I myself do not think that it would turn out to be the same in all cases. But a number of such phobias directed against larger animals have proved accessible to analysis and have thus betrayed their secret to the investigator. In every case it was the same: the fear at bottom was of the father, if the children examined were boys, and was merely displaced upon the animal.

Every one of any experience in psychoanalysis has undoubtedly seen such cases and has received the same impression from them. But I can refer to only a few detailed reports on the subject. This is an accident of the literature of such cases, from which the conclusion should not be drawn that our general assertion is based on merely scattered observation. For instance I mention an author, M. Wulff of Odessa, who has very

intelligently occupied himself with the neuroses of childhood. He tells, in relating the history of an illness, that a nine year old boy suffered from a dog phobia at the age of four. “When he saw a dog running by on the street he wept and cried: ‘Dear dog, don’t touch me, I will be good.’” By “being good” he meant “not to play violin any more” (to practise onanism)[A].

The same author later sums up as follows: “His dog phobia is really his fear of the father displaced upon the dog, for his peculiar expression: ‘Dog, I will be good’ — that is to say, I will not masturbate — really refers to the father who has forbidden masturbation.” He then adds something in a note which fully agrees with my experience and at the same time bears witness to the abundance of such experiences: “such phobias (of horses, dogs, cats, chickens and other domestic animals) are, I think, at least as prevalent as *pavor nocturnus* in childhood, and usually reveal themselves in the analysis as a displacement of fear from one of the parents to animals. I am not prepared to assert that the wide-spread mouse and rat phobia has the same mechanism.”

I reported the “Analysis of the Phobia of a five-year-old Boy” which the father of the little patient had put at my disposal. It was a fear of horses as a result of which the boy refused to go on the street. He expressed his apprehension that the horse would come into the room and bite him. It proves that this was meant to be the punishment for his wish that the horse should fall over (die). After assurances had relieved the boy of his fear of his father, it proved that he was fighting against wishes whose content was the absence (departure or death) of the father. He indicated only too plainly that he felt the father to be his rival for the favour of the mother, upon whom his budding sexual wishes were by dark premonitions directed. He therefore had the typical attitude of the male child to its parents which we call the ‘Oedipus complex’ in which we recognize the central complex of the neuroses in general. Through the analysis, of ‘little John’ we have learnt a fact which is very valuable in relation to totemism, namely, that under such conditions the child displaces a part of its feelings from the father upon some animal.

Analysis showed the paths of association, both significant and accidental in content, along which such a displacement took place. It also allowed one to guess the motives for the displacement. The hate which resulted from the rivalry for the mother could not permeate the boy’s psychic life without being inhibited; he had to contend with the tenderness

and admiration which he had felt for his father from the beginning, so that the child assumed a double or ambivalent emotional attitude towards the father and relieved himself of this ambivalent conflict by displacing his hostile and anxious feelings upon a substitute for the father. The displacement could not, however, relieve the conflict by bringing about a smooth division between the tender and the hostile feelings. On the contrary, the conflict was continued in reference to the object to which displacement has been made and to which also the ambivalence spreads. There was no doubt that little John had not only fear, but respect and interest for horses. As soon as his fear was moderated he identified himself with the feared animal; he jumped around like a horse, and now it was he who bit the father. In another stage of solution of the phobia he did not scruple to identify his parents with other large animals.

We may venture the impression that certain traits of totemism return as a negative expression in these animal phobias of children. But we are indebted to S. Ferenczi for a beautiful individual observation of what must be called a case of positive totemism in the child. It is true that with the little Arpád, whom Ferenczi reports, the totemic interests do not awaken in direct connexion with the Oedipus complex, but on the basis of a narcistic premise, namely, the fear of castration. But whoever looks attentively through the history of little John will also find there abundant proof that the father was admired as the possessor of large genitals and was feared as threatening the child's own genitals. In the Oedipus as well as in the castration complex the father plays the same rôle of feared opponent to the infantile sexual interests. Castration and its substitute through blinding is the punishment he threatens.

When little Arpád was two and a half years old he once tried, while at a summer resort, to urinate into the chicken coop, and on this occasion a chicken bit his penis or snapped at it. When he returned to the same place a year later he became a chicken himself, was interested only in the chicken coop and in everything that occurred there, and gave up human speech for cackling and crowing. During the period of observation, at the age of five, he spoke again, but his speech was exclusively about chickens and other fowl. He played with no other toy and sang only songs in which there was something about poultry. His behaviour towards his totem animal was subtly ambivalent, expressing itself in immoderate hating and loving. He loved best to play killing chickens. "The slaughtering of

poultry was quite a festival for him. He could dance around the animals' bodies for hours at a time in a state of intense excitement." But then he kissed and stroked the slaughtered animal, and cleaned and caressed the chicken effigies which he himself had ill-used.

Arpád himself saw to it that the meaning of his curious activity could not remain hidden. At times he translated his wishes from the totemic method, of expression back into that of everyday life. "Now I am small, now I am a chicken. When I get bigger I shall be a fowl. When I am bigger still, I shall be a cock." On another occasion he suddenly expressed the wish to eat a "potted mother" (by analogy, potted fowl). He was very free with open threats of castration against others, just as he himself had received them on account of onanistic preoccupation with his penis.

According to Ferenczi there was no doubt as to the source of his interest in the activities of the chicken yard: "The continual sexual activity between cock and hen, the laying of eggs and the creeping out of the young brood" satisfied his sexual curiosity which really was directed towards human family life. His object wishes have been formed on the model of chicken life when we find him saying to a woman neighbour: "I am going to marry you and your sister and my three cousins and the cook; no, instead of the cook I'll marry my mother."

We shall be able to complete our consideration of these observations later; at present we will only point out two traits that show a valuable correspondence with totemism: the complete identification with the totem animal, and the ambivalent affective attitude towards it. In view of these observations we consider ourselves justified in substituting the father for the totem animal in the male's formula of totemism. We then notice that in doing so we have taken no new or especially daring step. For primitive men say it themselves and, as far as the totemic system is still in effect to-day, the totem is called ancestor and primal father. We have only taken literally an expression of these races which ethnologists did not know what to do with and were therefore inclined to put it into the background. Psychoanalysis warns us, on the contrary, to emphasize this very point and to connect it with the attempt to explain totemism.

The first result of our substitution is very remarkable. If the totem animal is the father, then the two main commandments of totemism, the two taboo rules which constitute its nucleus, — not to kill the totem animal and not to use a woman belonging to the same totem for sexual

purposes, — agree in content with the two crimes of Oedipus, who slew his father and took his mother to wife, and also with the child's two primal wishes whose insufficient repression or whose re-awakening forms the nucleus of perhaps all neuroses. If this similarity is more than a deceptive play of accident it would perforce make it possible for us to shed light upon the origin of totemism in prehistoric times. In other words, we should succeed in making it probable that the totemic system resulted from the conditions underlying the Oedipus complex, just as the animal phobia of 'little John' and the poultry perversion of 'little Arpád' resulted from it. In order to trace this possibility we shall in what follows study a peculiarity of the totemic system or, as we may say, of the totemic religion, which until now could hardly be brought into the discussion.

4

W. Robertson Smith, who died in 1894, was a physicist, philologist, Bible critic, and archæologist, a many-sided as well as keen and free-thinking man, expressed the assumption in his work, *The Religion of the Semites*, published in 1889, that a peculiar ceremony, the so-called *totem feast*, had, from the very beginning, formed an integral part of the totemic system. For the support of this supposition he had at his disposal at that time only a single description of such an act from the year 500 A.D.; he knew, however, how to give a high degree of probability to his assumption through his analysis of the nature of sacrifice among the old Semites. As sacrifice assumes a godlike person we are dealing here with an inference from a higher phase of religious rite to its lowest phase in totemism.

I shall now cite from Robertson Smith's excellent book those statements about the origin and meaning of the sacrificial right which are of great interest to us; I shall omit the only too numerous tempting details as well as the parts dealing with all later developments. In such an excerpt it is quite impossible to give the reader any sense of the lucidity or of the argumentative force of the original.

Robertson Smith shows that sacrifice at the altar was the essential part of the rite of old religions. It plays the same rôle in all religions, so that its origin must be traced back to very general causes whose effects were everywhere the same.

But the sacrifice — the holy action κατεξογη (sacrificium ἱερουργία) — originally meant something different from what later times understood by it: the offering to the deity in order to reconcile him or to incline him to be favourable. The profane use of the word was afterwards derived from the secondary sense of self-denial. As is demonstrated the first sacrifice was nothing else than “an act of social fellowship between the deity and his worshipper”.

Things to eat and drink were brought as sacrifice; man offered to his god the same things as those on which he himself lived, flesh, cereals, fruits, wine and oil. Only in regard to sacrificial flesh did there exist restrictions and exceptions. The god partakes of the animal sacrifices with his worshippers while the vegetable sacrifices are left to him alone. There is no doubt that animal sacrifices are older and at one time were the only forms of sacrifice. The vegetable sacrifices resulted from the offering of the first-fruits and correspond to a tribute to the lord of the soil and the land. But animal sacrifice is older than agriculture.

Linguistic survivals make it certain that the part of the sacrifice destined for the god was looked upon as his real food. This conception became offensive with the progressive dematerialization of the deity, and was avoided by offering the deity only the liquid part of the meal. Later the use of fire, which made the sacrificial flesh ascend in smoke from the altar, made it possible to prepare human food in such a way that it was more suitable for the deity. The drink sacrifice was originally the blood of the sacrificed animals; wine was used later as a substitute for the blood. Primitive man looked upon wine as the “blood of the grape”, as our poets still call it.

The oldest form of sacrifice, older than the use of fire and the knowledge of agriculture, was therefore the sacrifice of animals, whose flesh and blood the god and his worshippers ate together. It was essential that both participants should receive their shares of the meal.

Such a sacrifice was a public ceremony, the celebration of a whole clan. As a matter of fact all religion was a public affair; religious duty was a part of the social obligation. Sacrifice and festival go together among all races; each sacrifice entails a holiday and no holiday can be celebrated without a sacrifice. The sacrificial festival was an occasion for joyously transcending one’s own interests and emphasizing social community and community with god.

The ethical power of the public sacrificial feast was based upon primal conceptions of the meaning of eating and drinking in common. To eat and drink with some one was at the same time a symbol and a confirmation of social community and of the assumption of mutual obligations; the sacrificial eating gave direct expression to the fact that the god and his worshippers are communicants, thus confirming all their other relations. Customs that to-day still are in force among the Arabs of the desert prove that the binding force resulting from the common meal is not a religious factor but that the subsequent mutual obligations are due to the act of eating itself. Whoever has shared the smallest bite with such a Bedouin, or has taken a swallow of his milk, need not fear him any longer as an enemy, but may be sure of his protection and help. Not indeed, forever, strictly speaking this lasts only while it may be assumed that the food partaken remains in the body. So realistically is the bond of union conceived; it requires repetition to strengthen it and make it endure.

But why is this binding power ascribed to eating and drinking in common? In the most primitive societies there is only one unconditional and never failing bond, that of kinship. The members of a community stand by each other jointly and severally, a kin is a group of persons whose life is so bound into a physical unity that they can be considered as parts of a common life. In case of the murder of one of this kin they therefore do not say: the blood of so and so has been spilt, but our blood has been spilt. The Hebraic phrase by which the tribal relation is acknowledged is: “Thou art my bone and my flesh”. Kinship therefore signifies having part in a general substance. It is natural then that it is based not only upon the fact that we are a part of the substance of our mother who has borne us, and whose milk nourished us, but also that the food eaten later through which the body is renewed, can acquire and strengthen kinship. If one shared a meal with one’s god the conviction was thus expressed that one was of the same substance as he; no meal was therefore partaken with any one recognized as a stranger.

The sacrificial repast was therefore originally a feast of the kin, following the rule that only those of kin could eat together. In our society the meal unites the members of the family; but the sacrificial repast has nothing to do with the family. Kinship is older than family life; the oldest families known to us regularly comprised persons who belonged to various bonds of kinship. The men married women of strange clans and the

children inherited the clan of the mother; there was no kinship between the man and the rest of the members of the family. In such a family there was no common meal. Even to-day savages eat apart and alone, and the religious prohibitions of totemism as to eating often make it impossible for them to eat with their wives and children.

Let us now turn to the sacrificial animal. There was, as we have heard, no meeting of the kin without animal sacrifice, but, and this is significant, no animal was slaughtered except for such a solemn occasion. Without any hesitation the people ate fruits, game and the milk of domestic animals, but religious scruples made it impossible for the individual to kill a domestic animal for his own use. There is not the least doubt, says Robertson Smith, that every sacrifice was originally a clan sacrifice, and that the *killing of a sacrificial animal* originally belonged to those acts which were *forbidden to the individual and were only justified if the whole kin assumed the responsibility*. Primitive men had only one class of actions, which were thus characterized, namely, actions which touched the holiness of the kin's common blood. A life which no individual might take and which could be sacrificed only through the consent and participation of all the members of the clan was on the same plane as the life of a member of the kin. The rule that every guest of the sacrificial repast must partake of the flesh of the sacrificial animal, had the same meaning as the rule that the execution of a guilty member of the kin must be performed by the whole kin. In other words: the sacrificial animal was treated like one of kin; *the sacrificing community, its god, and the sacrificial animal were of the same blood*, and the members of a clan.

On the basis of much evidence Robertson Smith identifies the sacrificial animal with the old totem animal. In a later age there were two kinds of sacrifices, those of domestic animals which usually were also eaten, and the unusual sacrifice of animals which were forbidden as being unclean. Further investigation then shows that these unclean animals were holy and that they were sacrificed to the gods to whom they were holy, that these animals were originally identified with the gods themselves and that at the sacrifice the worshippers in some way emphasized their blood relationship to the god and to the animal. But this difference between usual and 'mystic' sacrifices does not hold good for still earlier times. Originally all animals were holy, their meat was forbidden and might be eaten only on solemn occasions, with the participation of the whole kin.

The slaughter of the animal amounted to the spilling of the kin's blood and had to be done with the same precautions and assurances against reproach.

The taming of domestic animals and the rise of cattle-breeding seems everywhere to have put an end to the pure and rigorous totemism of earliest times. But such holiness as still clung to domestic animals in what was now a 'pastoral' religion, is sufficiently distinct for us to recognize its totemic character. Even in late classical times the rite in several localities prescribed flight for the sacrificer after the sacrifice, as if to escape revenge. In Greece the idea must once have been general that the killing of an ox was really a crime. At the Athenian festival of the Bouphonia a formal trial, to which all the participants were summoned, was instituted after the sacrifice. Finally it was agreed to put the blame for the murder upon the knife, which was then cast into the sea.

In spite of the dread which protects the life of the animal as being of kin, it became necessary to kill it from time to time in solemn conclave, and to divide its flesh and blood among the members of the clan. The motive which commands this act reveals the deepest meaning of the essence of sacrifice. We have heard that in later times every eating in common, the participation in the same substance which entered into their bodies, established a holy bond between the communicants; in oldest time this meaning seemed to be attached only to participation in the substance of a holy sacrifice. *The holy mystery of the sacrificial death was justified in that only in this way could the holy bond be established which united the participants with each other and with their god.*

This bond was nothing else than the life of the sacrificial animal which lived on its flesh and blood and was shared by all the participants by means of the sacrificial feast. Such an idea was the basis of all the *blood bonds* through which men in still later times became pledged to each other. The thoroughly realistic conception of consanguinity as an identity of substance makes comprehensible the necessity of renewing it from time to time through the physical process of the sacrificial repast.

We will now stop quoting from Robertson Smith's train of thought in order to give a condensed summary of what is essential in it. When the idea of private property came into existence sacrifice was conceived as a gift to the deity, as a transfer from the property of man to that of the god. But this interpretation left all the peculiarities of the sacrificial ritual unexplained. In oldest times the sacrificial animal itself had been holy and

its life inviolate; it could be taken only in the presence of the god, with the whole tribe taking part and sharing the guilt in order to furnish the holy substance through the eating of which the members of the clan assured themselves of their material identity with each other and with the deity. The sacrifice was a sacrament, and the sacrificial animal itself was one of the kin. In reality it was the old totem animal, the primitive god himself through the slaying and eating of whom the members of the clan revived and assured their similarity with the god.

From this analysis of the nature of sacrifice Robertson Smith drew the conclusion that the periodic killing and eating of the totem before the period when the *anthropomorphic deities were venerated* was an important part of totem religion. The ceremonial of such a totem feast was preserved for us, he thought, in the description of a sacrifice in later times. Saint Nilus tells of a sacrificial custom of the Bedouins in the desert of Sinai towards the end of the fourth century A.D. The victim, a camel, was bound and laid upon a rough altar of stones; the leader of the tribe made the participants walk three times around the altar to the accompaniment of song, inflicted the first wound upon the animal and greedily drank the spurting blood; then the whole community threw itself upon the sacrifice, cut off pieces of the palpitating flesh with their swords and ate them raw in such haste that in a short interval between the rise of the morning star, for whom this sacrifice was meant, and its fading before the rays of the sun, the whole sacrificial animal, flesh, skin, bones, and entrails, were devoured. According to every testimony this barbarous rite, which speaks of great antiquity, was not a rare custom but the general original form of the totem sacrifice, which in later times underwent the most varied modifications.

Many authors have refused to grant any weight to this conception of the totem feast because it could not be strengthened by direct observation at the stage of totemism. Robertson Smith himself has referred to examples in which the sacramental meaning of sacrifices seems certain, such as the human sacrifices of the Aztecs and others which recall the conditions of the totem feast, the bear sacrifices of the bear tribe of the *Ouataouaks* in America, and the bear festival of the Ainus in Japan. Frazer has given a full account of these and similar cases in the two divisions of his great work that have last appeared. An Indian tribe in California which reveres the buzzard, a large bird of prey, kills it once a year with solemn

ceremony, whereupon the bird is mourned and its skin and feathers preserved. The Zuni Indians in New Mexico do the same thing with their holy turtle.

In the *Intichiuma* ceremonies of Central Australian tribes a trait has been observed which fits in excellently with the assumptions of Robertson Smith. Every tribe that practises magic for the increase of its totem, which it cannot eat itself, is bound to eat a part of its totem at the ceremony before it can be touched by the other tribes. According to Frazer the best example of the sacramental consumption of the otherwise forbidden totem is to be found among the Bini in West Africa, in connexion with the burial ceremony of this tribe.

But we shall follow Robertson Smith in the assumption that the sacramental killing and the common consumption of the otherwise forbidden totem animal was an important trait of the totem religion.

5

Let us now envisage the scene of such a totem meal and let us embellish it further with a few probable features which could not be adequately considered before. Thus we have the clan, which on a solemn occasion kills its totem in a cruel manner and eats it raw, blood, flesh, and bones. At the same time the members of the clan disguised in imitation of the totem, mimic it in sound and movement as if they wanted to emphasize their common identity. There is also the conscious realization that an action is being carried out which is forbidden to each individual and which can only be justified through the participation of all, so that no one is allowed to exclude himself from the killing and the feast. After the act is accomplished the murdered animal is bewailed and lamented. The death lamentation is compulsive, being enforced by the fear of a threatening retribution, and its main purpose is, as Robertson Smith remarks on an analogous occasion, to exculpate oneself from responsibility for the slaying.

But after this mourning there follows loud festival gaiety accompanied by the unchaining of every impulse and the permission of every gratification. Here we find an easy insight into the nature of the *holiday*.

A holiday is permitted, or rather a prescribed excess, a solemn violation of a prohibition. People do not commit the excesses which at all times

have characterized holidays, as a result of an order to be in a holiday mood, but because in the very nature of a holiday there is excess; the holiday mood is brought about by the release of what is otherwise forbidden.

But what has mourning over the death of the totem animal to do with the introduction of this holiday spirit? If men are happy over the slaying of the totem, which is otherwise forbidden to them, why do they also mourn it?

We have heard that members of a clan become holy through the consumption of the totem and thereby also strengthen their identification with it and with each other. The fact that they have absorbed the holy life with which the substance of the totem is charged may explain the holiday mood and everything that results from it.

Psychoanalysis has revealed to us that the totem animal is really a substitute for the father, and this really explains the contradiction that it is usually forbidden to kill the totem animal, that the killing of it results in a holiday and that the animal is killed and yet mourned. The ambivalent emotional attitude which to-day still marks the father complex in our children and so often continues into adult life also extended to the father substitute of the totem animal.

But if we associate the translation of the totem as given by psychoanalysis, with the totem feast and the Darwinian hypothesis about the primal state of human society, a deeper understanding becomes possible and a hypothesis is offered which may seem fantastic but which has the advantage of establishing an unexpected unity among a series of hitherto separated phenomena.

The Darwinian conception of the primal horde does not, of course, allow for the beginning of totemism. There is only a violent, jealous father who keeps all the females for himself and drives away the growing sons. This primal state of society has nowhere been observed. The most primitive organization we know, which to-day is still in force with certain tribes, is *associations of men* consisting of members with equal rights, subject to the restrictions of the totemic system, and founded on matriarchy, or descent through the mother. Can the one have resulted from the other, and how was this possible?

By basing our argument upon the celebration of the totem we are in a position to give an answer: One day the expelled brothers joined forces,

slew and ate the father, and thus put an end to the father horde. Together they dared and accomplished what would have remained impossible for them singly. Perhaps some advance in culture, like the use of a new weapon, had given them the feeling of superiority. Of course these cannibalistic savages ate their victim. This violent primal father had surely been the envied and feared model for each of the brothers. Now they accomplished their identification with him by devouring him and each acquired a part of his strength. The totem feast, which is perhaps mankind's first celebration, would be the repetition and commemoration of this memorable, criminal act with which so many things began, social organization, moral restrictions and religion.

In order to find these results acceptable, quite aside from our supposition, we need only assume that the group of brothers banded together were dominated by the same contradictory feelings towards the father which we can demonstrate as the content of ambivalence of the father complex in all our children and in neurotics. They hated the father who stood so powerfully in the way of their sexual demands and their desire for power, but they also loved and admired him. After they had satisfied their hate by his removal and had carried out their wish for identification with him, the suppressed tender impulses had to assert themselves. This took place in the form of remorse, a sense of guilt was formed which coincided here with the remorse generally felt. The dead now became stronger than the living had been, even as we observe it to-day in the destinies of men. What the fathers' presence had formerly prevented they themselves now prohibited in the psychic situation of 'subsequent obedience', which we know so well from psychoanalysis. They undid their deed by declaring that the killing of the father substitute, the totem, was not allowed, and renounced the fruits of their deed by denying themselves the liberated women. Thus they created the two fundamental taboos of totemism out of the *sense of guilt of the son*, and for this very reason these had to correspond with the two repressed wishes of the Oedipus complex. Whoever disobeyed became guilty of the two only crimes which troubled primitive society.

The two taboos of totemism with which the morality of man begins are psychologically not of equal value. One of them, the sparing of the totem animal, rests entirely upon emotional motives; the father had been removed and nothing in reality could make up for this. But the other, the

incest prohibition, had, besides, a strong practical foundation. Sexual need does not unite men; it separates them. Though the brothers had joined forces in order to overcome the father, each was the other's rival among the women. Each one wanted to have them all to himself like the father, and in the fight of each against the other the new organization would have perished. For there was no longer any one stronger than all the rest who could have successfully assumed the rôle of the father. Thus there was nothing left for the brothers, if they wanted to live together, but to erect the incest prohibition — perhaps after many difficult experiences — through which they all equally renounced the women whom they desired, and on account of whom they had removed the father in the first place. Thus they saved the organization which had made them strong and which could be based upon the homo-sexual feelings and activities which probably manifested themselves among them during the time of their banishment. Perhaps this situation also formed the germ of the institution of the mother right discovered by Bachofen, which was then abrogated by the patriarchal family arrangement.

On the other hand the claim of totemism to be considered the first attempt at a religion is connected with the other taboo which protects the life of the totem animal. The feelings of the sons found a natural and appropriate substitute for the father in the animal, but their compulsory treatment of it expressed more than the need of showing remorse. The surrogate for the father was perhaps used in the attempt to assuage the burning sense of guilt, and to bring about a kind of reconciliation with the father. The totemic system was a kind of agreement with the father in which the latter granted everything that the child's phantasy could expect from him, protection, care, and forbearance, in return for which the pledge was given to honour his life, that is to say, not to repeat the act against the totem through which the real father had perished. Totemism also contained an attempt at justification, "If the father had treated us like the totem we should never have been tempted to kill him." Thus totemism helped to gloss over the real state of affairs and to make one forget the event to which it owed its origin.

In this connexion some features were formed which henceforth determined the character of every religion. The totem religion had issued from the sense of guilt of the sons as an attempt to palliate this feeling and to conciliate the injured father through subsequent obedience. All later

religions prove to be attempts to solve the same problem, varying only in accordance with the stage of culture in which they are attempted and according to the paths which they take; they are all, however, reactions aiming at the same great event with which culture began and which ever since has not let mankind come to rest.

There is still another characteristic faithfully preserved in religion which already appeared in totemism at this time. The ambivalent strain was probably too great to be adjusted by any arrangement, or else the psychological conditions are entirely unfavourable to any kind of settlement of these contradictory feelings. It is certainly noticeable that the ambivalence attached to the father complex also continues in totemism and in religions in general. The religion of totemism included not only manifestations of remorse and attempts at reconciliation, but also serves to commemorate the triumph over the father. The gratification obtained thereby creates the commemorative celebration of the totem feast at which the restrictions of subsequent obedience are suspended, and makes it a duty to repeat the crime of parricide through the sacrifice of the totem animal as often as the benefits of this deed, namely, the appropriation of the father's properties, threaten to disappear as a result of the changed influences of life. We shall not be surprised to find that a part of the son's defiance also reappears, often in the most remarkable disguises and inversions, in the formation of later religions.

If thus far we have followed, in religion and moral precepts — but little differentiated in totemism — the consequences of the tender impulses towards the father as they are changed into remorse, we must not overlook the fact that for the most part the tendencies which have impelled to parricide have retained the victory. The social and fraternal feelings on which this great change is based, henceforth for long periods exercises the greatest influence upon the development of society. They find expression in the sanctification of the common blood and in the emphasis upon the solidarity of life within the clan. In thus ensuring each other's lives the brothers express the fact that no one of them is to be treated by the other as they all treated the father. They preclude a repetition of the fate of the father. The socially established prohibition against fratricide is now added to the prohibition against killing the totem, which is based on religious grounds. It will still be a long time before the commandment discards the restriction to members of the tribe and assumes the simple phraseology:

Thou shalt not kill. At first the *brother clan* has taken the place of the *father horde* and was guaranteed by the blood bond. Society is now based on complicity in the common crime, religion on the sense of guilt and the consequent remorse, while morality is based partly on the necessities of society and partly on the expiation which this sense of guilt demands.

Thus psychoanalysis, contrary to the newer conceptions of the totemic system and more in accord with older conceptions, bids us argue for an intimate connexion between totemism and exogamy as well as for their simultaneous origin.

6

I am under the influence of many strong motives which restrain me from the attempt to discuss the further development of religions from their beginning in totemism up to their present state. I shall follow out only two threads as I see them appearing in the weft with especial distinctness: the motive of the totem sacrifice and the relation of the son to the father.

Robertson Smith has shown us that the old totem feast returns in the original form of sacrifice. The meaning of the rite is the same: sanctification through participation in the common meal. The sense of guilt, which can only be allayed through the solidarity of all the participants, has also been retained. In addition to this there is the tribal deity in whose supposed presence the sacrifice takes place, who takes part in the meal like a member of the tribe, and with whom identification is effected by the act of eating the sacrifice. How does the god come into this situation which originally was foreign to him?

The answer might be that the idea of god had meanwhile appeared, — no one knows whence — and had dominated the whole religious life, and that the totem feast, like everything else that wished to survive, had been forced to fit itself into the new system. However, psychoanalytic investigation of the individual teaches with especial emphasis that god is in every case modelled after the father and that our personal relation to god is dependent upon our relation to our physical, fluctuating and changing with him, and that god at bottom is nothing but an exalted father. Here also, as in the case of totemism, psychoanalysis advises us to believe the faithful, who call god father just as they called the totem their ancestor. If psychoanalysis deserves any consideration at all, then the

share of the father in the idea of a god must be very important, quite aside from all the other origins and meanings of god upon which psychoanalysis can throw no light. But then the father would be represented twice in primitive sacrifice, first as god, and secondly as the totem-animalsacrifice, and we must ask, with all due regard for the limited number of solutions which psychoanalysis offers, whether this is possible and what the meaning of it may be.

We know that there are a number of relations of the god to the holy animal (the totem and the sacrificial animal): 1. Usually one animal is sacred to every god, sometimes even several animals. 2. In certain, especially holy, sacrifices, the so-called ‘mystical’ sacrifices, the very animal which had been sanctified through the god was sacrificed to him. 3. The god was often revered in the form of an animal, or from another point of view, animals enjoyed a godlike reverence long after the period of totemism. 4. In myths the god is frequently transformed into an animal, often into the animal that is sacred to him. From this the assumption was obvious that the god himself was the animal, and that he had evolved from the totem animal at a later stage of religious feeling. But the reflection that the totem itself is nothing but a substitute for the father relieves us of all further discussion. Thus the totem may have been the first form of the father substitute and the god a later one in which the father regained his human form. Such a new creation from the root of all religious evolution, namely, the longing for the father, might become possible if in the course of time an essential change had taken place in the relation to the father and perhaps also to the animal.

Such changes are easily divined even if we disregard the beginning of a psychic estrangement from the animal as well as the disintegration of totemism through animal domestication. The situation created by the removal of the father contained an element which in the course of time must have brought about an extraordinary increase of longing for the father. For the brothers who had joined forces to kill the father had each been animated by the wish to become like the father and had given expression to this wish by incorporating parts of the substitute for him in the totem feast. In consequence of the pressure which the bonds of the brother clan exercised upon each member, this wish had to remain unfulfilled. No one could or was allowed to attain the father’s perfection of power, which was the thing they had all sought. Thus the bitter feeling

against the father which had incited to the deed could subside in the course of time, while the longing for him grew, and an ideal could arise having as a content the fullness of power and the freedom from restriction of the conquered primal father, as well as the willingness to subject themselves to him. The original democratic equality of each member of the tribe could no longer be retained on account of the interference of cultural changes; in consequence of which there arose a tendency to revive the old father ideal in the creation of gods through the veneration of those individuals who had distinguished themselves above the rest. That a man should become a god and that a god should die, which to-day seems to us an outrageous presumption, was still by no means offensive to the conceptions of classical antiquity. But the deification of the murdered father from whom the tribe now derived its origin, was a much more serious attempt at expiation than the former covenant with the totem.

In this evolution I am at a loss to indicate the place of the great maternal deities who perhaps everywhere preceded the paternal deities. But it seems certain that the change in the relation to the father was not restricted to religion but logically extended to the other side of human life influenced by the removal of the father, namely, the social organization. With the institution of paternal deities the fatherless society gradually changed into a patriarchal one. The family was a reconstruction of the former primal horde and also restored a great part of their former rights to the fathers. Now there were patriarchs again but the social achievements of the brother clan had not been given up and the actual difference between the new family patriarchs and the unrestricted primal father was great enough to ensure the continuation of the religious need, the preservation of the unsatisfied longing for the father.

The father therefore really appears twice in the scene of sacrifice before the tribal god, once as the god and again as the totem-sacrificial-animal. But in attempting to understand this situation we must beware of interpretations which superficially seek to translate it as an allegory, and which forget the historical stages in the process. The twofold presence of the father corresponds to the two successive meanings of the scene. The ambivalent attitude towards the father as well as the victory of the son’s tender emotional feelings over his hostile ones, have here found plastic expression. The scene of vanquishing the father, his greatest degradation, furnishes here the material to represent his highest triumph. The meaning

which sacrifice has quite generally acquired is found in the fact that in the very same action which continues the memory of this misdeed it offers satisfaction to the father for the ignominy put upon him.

In the further development the animal loses its sacredness and the sacrifice its relation to the celebration of the totem; the rite becomes a simple offering to the deity, a self-deprivation in favour of the god. God himself is now so exalted above man that he can be communicated with only through a priest as intermediary. At the same time the social order produces godlike kings who transfer the patriarchal system to the state. It must be said that the revenge of the deposed and reinstated father has been very cruel; it culminated in the dominance of authority. The subjugated sons have used the new relation to disburden themselves still more of their sense of guilt. Sacrifice, as it is now constituted, is entirely beyond their responsibility. God himself has demanded and ordained it. Myths in which the god himself kills the animal that is sacred to him, which he himself really is, belong to this phase. This is the greatest possible denial of the great misdeed with which society and the sense of guilt began. There is an unmistakable second meaning in this sacrificial demonstration. It expresses satisfaction at the fact that the earlier father substitute has been abandoned in favour of the higher conception of god. The superficial allegorical translation of the scene here roughly corresponds with its psychoanalytic interpretation by saying that god is represented as overcoming the animal part of his nature.

But it would be erroneous to believe that in this period of renewed patriarchal authority the hostile impulses which belong to the father complex had entirely subsided. On the contrary, the first phases in the domination of the two new substitutive formations for the father, those of gods and kings, plainly show the most energetic expression of that ambivalence which is characteristic of religion.

In his great work, *The Golden Bough*, Frazer has expressed the conjecture that the first kings of the Latin tribes were strangers who played the part of a deity and were solemnly sacrificed in this rôle on specified holidays. The yearly sacrifice (self-sacrifice is a variant) of a god seems to have been an important feature of Semitic religions. The ceremony of human sacrifice in various parts of the inhabited world makes it certain that these human beings ended their lives as representatives of the deity. This sacrificial custom can still be traced in later times in the

substitution of an inanimate imitation (doll) for the living person. The theanthropic god sacrifice into which unfortunately I cannot enter with the same thoroughness with which the animal sacrifice has been treated throws the clearest light upon the meaning of the older forms of sacrifice. It acknowledges with unsurpassable candour that the object of the sacrificial action has always been the same, being identical with what is now revered as a god, namely with the father. The question as to the relation of animal to human sacrifice can now be easily solved. The original animal sacrifice was already a substitute for a human sacrifice, for the solemn killing of the father, and when the father substitute regained its human form, the animal substitute could also be retransformed into a human sacrifice.

Thus the memory of that first great act of sacrifice had proved to be indestructible despite all attempts to forget it, and just at the moment when men strove to get as far away as possible from its motives, the undistorted repetition of it had to appear in the form of the god sacrifice. I need not fully indicate here the developments of religious thought which made this return possible in the form of rationalizations. Robertson Smith who is, of course, far removed from the idea of tracing sacrifice back to this great event of man's primal history, says that the ceremony of the festivals in which the old Semites celebrated the death of a deity were interpreted as "a commemoration of a mythical tragedy" and that the attendant lament was not characterized by spontaneous sympathy, but displayed a compulsive character, something that was imposed by the fear of a divine wrath. We are in a position to acknowledge that this interpretation was correct, the feelings of the celebrants being well explained by the basic situation.

We may now accept it as a fact that in the further development of religions these two inciting factors, the son's sense of guilt and his defiance, were never again extinguished. Every attempted solution of the religious problem and every kind of reconciliation of the two opposing psychic forces gradually falls to the ground, probably under the combined influence of cultural changes, historical events, and inner psychic transformations.

The endeavour of the son to put himself in place of the father god, appeared with greater and greater distinctness. With the introduction of agriculture the importance of the son in the patriarchal family increased.

He was emboldened to give new expression to his incestuous libido which found symbolic satisfaction in labouring over mother earth. There came into existence figures of gods like Attis, Adonis, Tammuz, and others, spirits of vegetation as well as youthful divinities who enjoyed the favours of maternal deities and committed incest with the mother in defiance of the father. But the sense of guilt which was not allayed through these creations, was expressed in myths which visited these youthful lovers of the maternal goddesses with short life and punishment through castration or through the wrath of the father god appearing in animal form. Adonis was killed by the boar, the sacred animal of Aphrodite; Attis, the lover of Kybele, died of castration. The lamentation for these gods and the joy at their resurrection have gone over into the ritual of another son which divinity was destined to survive long.

When Christianity began its entry into the ancient world it met with the competition of the religion of Mithras and for a long time it was doubtful which deity was to be the victor.

The bright figure of the youthful Persian god has eluded our understanding. Perhaps we may conclude from the illustrations of Mithras slaying the steers that he represented the son who carried out the sacrifice of the father by himself and thus released the brothers from their oppressing complicity in the deed. There was another way of allaying this sense of guilt and this is the one that Christ took. He sacrificed his own life and thereby redeemed the brothers from primal sin.

The theory of primal sin is of Orphic origin; it was preserved in the mysteries and thence penetrated into the philosophic schools of Greek antiquity. Men were the descendants of Titans, who had killed and dismembered the young Dionysos-Zagreus; the weight of this crime oppressed them. A fragment of Anaximander says that the unity of the world was destroyed by a primordial crime and everything that issued from it must carry on the punishment for this crime. Although the features of banding together, killing, and dismembering as expressed in the deed of the Titans very clearly recall the totem sacrifice described by St Nilus — as also many other myths of antiquity, for example, the death of Orpheus himself — we are nevertheless disturbed here by the variation according to which a youthful god was murdered.

In the Christian myth man’s original sin is undoubtedly an offence against God the Father, and if Christ redeems mankind from the weight of

original sin by sacrificing his own life, he forces us to the conclusion that this sin was murder. According to the law of retaliation which is deeply rooted in human feeling, a murder can be atoned only by the sacrifice of another life; the self-sacrifice points to a blood-guilt. And if this sacrifice of one's own life brings about a reconciliation with god, the father, then the crime which must be expiated can only have been the murder of the father.

Thus in the Christian doctrine mankind most unreservedly acknowledges the guilty deed of primordial times because it now has found the most complete expiation for this deed in the sacrificial death of the son. The reconciliation with the father is the more thorough because simultaneously with this sacrifice there follows the complete renunciation of woman, for whose sake mankind rebelled against the father. But now also the psychological fatality of ambivalence demands its rights. In the same deed which offers the greatest possible expiation to the father, the son also attains the goal of his wishes against the father. He becomes a god himself beside or rather in place of his father. The religion of the son succeeds the religion of the father. As a sign of this substitution the old totem feast is revived again in the form of communion in which the band of brothers now eats the flesh and blood of the son and no longer that of the father, the sons thereby identifying themselves with him and becoming holy themselves. Thus through the ages we see the identity of the totem feast with the animal sacrifice, the theanthropic human sacrifice, and the Christian eucharist, and in all these solemn occasions we recognize the after-effects of that crime which so oppressed men but of which they must have been so proud. At bottom, however, the Christian communion is a new setting aside of the father, a repetition of the crime that must be expiated. We see how well justified is Frazer's dictum that "the Christian communion has absorbed within itself a sacrament which is doubtless far older than Christianity".

7

A process like the removal of the primal father by the band of brothers must have left ineradicable traces in the history of mankind and must have expressed itself the more frequently in numerous substitutive formations the less it itself was to be remembered. I am avoiding the temptation of

pointing out these traces in mythology, where they are not hard to find, and am turning to another field in following a hint of S. Reinach in his suggestive treatment of the death of Orpheus.

There is a situation in the history of Greek art which is strikingly familiar even if profoundly divergent, to the scene of a totem feast discovered by Robertson Smith. It is the situation of the oldest Greek tragedy. A group of persons, all of the same name and dressed in the same way, surround a single figure upon whose words and actions they are dependent, to represent the chorus and the original single impersonator of the hero. Later developments created a second and a third actor in order to represent opponents in playing, and off-shoots of the hero, but the character of the hero as well as his relation to the chorus remains unchanged. The hero of the tragedy had to suffer; this is to-day still the essential content of a tragedy. He had taken upon himself the so-called ‘tragic guilt’, which is not always easy to explain; it is often not a guilt in the ordinary sense. Almost always it consisted of a rebellion against a divine or human authority and the chorus accompanied the hero with their sympathies, trying to restrain and warn him, and lamented his fate after he had met with what was considered fitting punishment for his daring attempt.

But why did the hero of the tragedy have to suffer, and what was the meaning of his ‘tragic’ guilt? We will cut short the discussion by a prompt answer. He had to suffer because he was the primal father, the hero of that primordial tragedy the repetition of which here serves a certain tendency, and the tragic guilt is the guilt which he had to take upon himself in order to free the chorus of theirs. The scene upon the stage came into being through purposive distortion of the historical scene or, one is tempted to say, it was the result of refined hypocrisy. Actually, in the old situation, it was the members of the chorus themselves who had caused the suffering of the hero; here, on the other hand, they exhaust themselves in sympathy and regret, and the hero himself is to blame for his suffering. The crime foisted upon him, namely, presumption and rebellion against a great authority, is the same as that which in the past oppressed the colleagues of the chorus, namely, the band of brothers. Thus the tragic hero, though still against his will, is made the redeemer of the chorus.

When one bears in mind the suffering of the divine goat Dionysos in the performance of the Greek tragedy and the lament of the retinue of goats

who identified themselves with him, one can easily understand how the almost extinct drama was reviewed in the Middle Ages in the Passion of Christ.

In closing this study, which has been carried out in extremely condensed form, I want to state the conclusion that the beginnings of religion, ethics, society, and art meet in the Oedipus complex. This is in entire accord with the findings of psychoanalysis, namely, that the nucleus of all neuroses as far as our present knowledge of them goes is the Oedipus complex. It comes as a great surprise to me that these problems of racial psychology can also be solved through a single concrete instance, such as the relation to the father. Perhaps another psychological problem must be included here. We have so frequently had occasion to show the ambivalence of emotions in its real sense, that is to say the coincidence of love and hate towards the same object, at the root of important cultural formations. We know nothing about the origin of this ambivalence. It may be assumed to be a fundamental phenomenon of our emotional life. But the other possibility seems to me also worthy of consideration: that ambivalence, originally foreign to our emotional life was acquired by mankind from the father complex, where psychoanalytic investigation of the individual to-day still reveals the strongest expression of it.

Before closing we must take into account that the remarkable convergence reached in these illustrations, pointing to a single inclusive relation, ought not to blind us to the uncertainties of our assumptions and to the difficulties of our conclusions. Of these difficulties I will point out only two which must have forced themselves upon many readers.

In the first place it can hardly have escaped any one that we base everything upon the assumption of a psyche of the mass in which psychic processes occur as in the psychic life of the individual. Moreover, we let the sense of guilt for a deed survive for thousands of years, remaining effective in generations which could not have known anything of this deed. We allow an emotional process such as might have arisen among generations of sons that had been ill-treated by their fathers, to continue to new generations which had escaped such treatment by the very removal of the father. These seem indeed to be weighty objections and any other explanation which can avoid such assumptions would seem to merit preference.

But further consideration shows that we ourselves do not have to carry the whole responsibility for such daring. Without the assumption of a mass psyche, or a continuity in the emotional life of mankind which permits us to disregard the interruptions of psychic acts through the transgression of individuals, social psychology could not exist at all. If psychic processes of one generation did not continue in the next, if each had to acquire its attitude towards life afresh, there would be no progress in this field and almost no development. We are now confronted by two new questions: how much can be attributed to this psychic continuity within the series of generations, and what ways and means does a generation use to transfer its psychic states to the next generation? I do not claim that these problems have been sufficiently explained or that direct communication and tradition, of which one immediately thinks, are adequate for the task. Social psychology is in general little concerned with the manner in which the required continuity in the psychic life of succeeding generations is established. A part of the task seems to be performed by the inheritance of psychic dispositions which, however, need certain incentives in the individual life in order to become effective. This may be the meaning of the poet's words: "Strive to possess yourself of what you have inherited from your ancestors." The problem would appear more difficult if we could admit that there are psychic impulses which can be so completely suppressed that they leave no traces whatsoever behind them. But that does not exist. The greatest suppression must leave room for distorted substitutions and their resulting reactions. But in that case we may assume that no generation is capable of concealing its more important psychic processes from the next. For psychoanalysis has taught us that in his unconscious psychic activity every person possesses an apparatus which enables him to interpret the reactions of others, that is to say, to straighten out the distortions which the other person has affected in the expression of his feelings. By this method of unconscious understanding of all customs, ceremonies, and laws which the original relation to the primal father had left behind, later generations may also have succeeded in taking over this legacy of feelings.

There is another objection which the analytic method of thought itself might raise.

We have interpreted the first rules of morality and moral restrictions of primitive society as reactions to a deed which gave the authors of it the

conception of crime. They regretted this deed and decided that it should not be repeated and that its execution must bring no gain. This creative sense of guilt has not become extinct with us. We find its asocial effects in neurotics producing new rules of morality and continued restrictions, in expiation for misdeeds committed, or as precautions against misdeeds to be committed. But when we examine these neurotics for the deeds which have called forth such reactions, we are disappointed. We do not find deeds, but only impulses and feelings which sought evil but which were restrained from carrying it out. Only psychic realities and not actual ones are at the basis of the neurotics' sense of guilt. It is characteristic of the neurosis to put a psychic reality above an actual one and to react as seriously to thoughts as the normal person reacts only towards realities.

May it not be true that the case was somewhat the same with primitive men? We are justified in ascribing to them an extraordinary over-valuation of their psychic acts as a partial manifestation of their narcistic organization. According to this the mere impulses of hostility towards the father and the existence of the wish phantasy to kill and devour him may have sufficed to bring about the moral reaction which has created totemism and taboo. We should thus escape the necessity of tracing back the beginning of our cultural possession, of which we rightly are so proud, to a horrible crime which wounds all our feelings. The causal connexion, which stretches from that beginning to the present time, would not be impaired, for the psychic reality would be of sufficient importance to account for all those consequences. It may be agreed that a change has really taken place in the form of society from the father horde to the brother clan. This is a strong argument, but it is not conclusive. The change might have been accomplished in a less violent manner and still have conditioned the appearance of the moral reaction. As long as the pressure of the primal father was felt the hostile feelings against him were justified and repentance at these feelings had to wait for another opportunity. Of as little validity is the second objection, that everything derived from the ambivalent relation to the father, namely taboos, and rules of sacrifice, is characterized by the highest seriousness and by complete reality. The ceremonials and inhibitions of compulsion neurotics exhibit this characteristic too and yet they go back to a merely psychic reality, to resolution and not to execution. We must beware of introducing the contempt for what is merely thought or wished which characterizes our

sober world where there are only material values, into the world of primitive man and the neurotic, which is full of inner riches only.

We face a decision here which is really not easy. But let us begin by acknowledging that the difference which may seem fundamental to others does not, in our judgment, touch the most important part of the subject. If wishes and impulses have the full value of fact for primitive man, it is for us to follow such a conception intelligently instead of correcting it according to our standard. But in that case we must scrutinize more closely the prototype of the neurosis itself which is responsible for having raised this doubt. It is not true that compulsion neurotics, who to-day are under the pressure of over-morality, defend themselves only against the psychic reality of temptations and punish themselves for impulses which they have only felt. A piece of historic reality is also involved; in their childhood these persons had nothing but evil impulses and as far as their childish impotence permitted they put them into action. Each of these over-good persons had a period of badness in his childhood, and a perverse phase as a fore-runner and a premise of the latter over morality. The analogy between primitive men and neurotics is therefore much more fundamentally established if we assume that with the former, too, the psychic reality, concerning whose structure there is no doubt, originally coincided with the actual reality, and that primitive men really did what according to all testimony they intended to do.

But we must not let our judgment about primitive men be influenced too far by the analogy with neurotics. Differences must also be taken into account. Of course the sharp division between thinking and doing as we draw it does not exist either with savages or with neurotics. But the neurotic is above all inhibited in his actions; with him the thought is a complete substitute for the deed. Primitive man is not inhibited, the thought is directly converted into the deed, the deed is for him so to speak rather a substitute for the thought, and for that reason I think we may well assume in the case we are discussing, though without vouching for the absolute certainty of the decision, that “In the beginning was the deed”.

THE END

ON THE HISTORY OF THE PSYCHO-ANALYTIC MOVEMENT

Translated by A. A. Brill

CONTENTS

I

III

I

If in what follows I bring any contribution to the history of the psychoanalytic movement nobody must be surprised at the subjective nature of this paper, nor at the rôle which falls to me therein. For psychoanalysis is my creation; for ten years I was the only one occupied with it, and all the annoyance which this new subject caused among my contemporaries has been hurled upon my head in the form of criticism. Even today, when I am no longer the only psychoanalyst, I feel myself justified in assuming that none can know better than myself what psychoanalysis is, wherein it differs from other methods of investigating the psychic life, what its name should cover, or what might better be designated as some thing else.

In the year 1909, when I was first privileged to speak publicly on psychoanalysis in an American University, fired by this momentous occasion for my endeavors, I declared that it was not myself who brought psychoanalysis into existence. I said that it was Josef Breuer, who had merited this honor at a time when I was a student and busy working for my examinations (1880-1882). Since then, well-intentioned friends have frequently repeated that I then expressed my gratitude out of all due proportion. They considered that, as on previous occasions, I should have dignified Breuers “cathartic procedure” as merely preliminary to psychoanalysis, and should have claimed that psychoanalysis itself only began with my rejection of the hypnotic technique and my introduction of free association. Now it is really a matter of indifference whether the history of psychoanalysis be considered to have started with the cathartic method or only with my modification of the same. I only enter into this uninteresting question because some opponents of psychoanalysis are wont to recall, now and then, that the art of psychoanalysis did not originate with me at all, but with Breuer. Naturally, this only happens to be the case when their attitude permits them to find in psychoanalysis something that is noteworthy; on the other hand when their repudiation of psychoanalysis is unlimited, then psychoanalysis is always indisputably my creation. I have never yet heard that Breuer’s great part in psychoanalysis has brought him an equal measure of insult and reproach. As I have recognized long since that it is the inevitable fate of

psychoanalysis to arouse opposition and to embitter people, I have come to the conclusion that I must surely be the originator of all that characterizes psychoanalysis. I add, with satisfaction, that none of the attempts to belittle my share in this much disdained psychoanalysis has ever come from Breuer himself, or could boast of his support.

The content of Breuer's discovery has been so often presented that a detailed discussion of it here may be omitted. Its fundamental fact is that the symptoms of hysterical patients depend upon impressive but forgotten scenes in their lives (traumata). The therapy founded thereon was to cause the patients to recall and reproduce these experiences under hypnosis (catharsis), and the fragmentary theory, deduced from it was that these symptoms cor responded to an abnormal use of undischarged sums of excitement (conversion). In his theoretical contribution to the "Studies of Hysteria" Breuer, wherever obliged to mention *conversion*, has always added my name in parenthesis, as though this first attempt at a theoretical formulation was my mental property. I think this allotment refers only to the nomenclature, whilst the conception itself occurred to us both at the same time.

It is also well known that Breuer, after his first experience with it, allowed the cathartic treatment to rest for a number of years and only resumed it after I caused him to do so, on my return from Charcot. He was then an internist and taken up with a rather busy medical practice. I had become a physician quite reluctantly but had, at that time, received a strong motive for desiring to help nervous patients or, at least, to learn to understand something of their conditions. I had placed reliance on physical therapy and found myself helpless in the face of disappointments that came to me with W. Erbs "Electrotherapy," so rich in advice and indications. If I did not, at that time, pilot myself independently to the opinion later announced by Moebius, that the successes of electrotherapy in nervous disorders are the results of suggestion, it was surely only the absence of these successes that was to blame. The treatment by *suggestion* in deep hypnosis seemed to offer me at that time sufficient compensation for the lost electrical therapy. I learned this treatment through the extremely impressive demonstrations of Liébault and Bernheim. But the investigation under hypnosis with which I became acquainted through Breuer, I found, owing to its automatic manner of working and the simultaneous gratification of ones eagerness for knowledge, much more

attractive than the monotonous and violent suggestive command which was devoid of every possibility of inquiry.

As one of the latest achievements of psychoanalysis, we have lately been admonished to put the actual conflict and the cause of the illness into the foreground of analysis. This is exactly what Breuer and I did in the beginning of our work with the cathartic method. We guided the patients attention directly to the traumatic scene during which the symptom had arisen, tried to find therein the psychic conflict and to free the repressed affect. We thus discovered the procedure characteristic of the psychic processes of the neuroses which I later named *regression*. The associations of the patients went back from the scene to be explained, to earlier experiences, and this forced the analysis which was to correct the present to occupy itself with the past. This regression led even further backwards. At first it went quite regularly to the time of puberty. Later, however, such failures as gaps in the understanding tempted the analytic work further back into the years of childhood which had, hitherto, been inaccessible to every sort of investigation. This regressive direction became an important characteristic of the analysis. It was proved that psychoanalysis could not clear up anything actual, except by going back to something in the past. It even proved that every pathological experience presupposes an earlier one which, though not in itself pathological, lent a pathological quality to the later occurrence. But the temptation to stop short at the known actual cause was so great that even in later analyses I yielded to it. In the case of the patient called “Dora,” carried out in 1899, the scene which caused the outbreak of the actual illness was known to me. I tried uncounted times to analyse this experience, but all that I could receive to my direct demands was the same scanty and broken description. Only after a long detour, which led through the earliest childhood of the patient, a dream appeared in the analysis of which the hitherto forgotten details of the scene were remembered, and this made possible the understanding and solution of the actual conflict.

From this one example it may be seen how misleading is the above mentioned admonition and how much of a scientific regression it is to follow the advice of neglecting the regression in the analytic technique.

The first difference of opinion between Breuer and myself came to light on a question of the more intimate psychic mechanism of hysteria. He still favored a physiological theory, so to speak, arid wished to explain the

psychic splitting of consciousness of hysterical subjects by means of the non-communication of various psychic states (or states of consciousness, as we then called them). He thus created the theory of the “hypnoid states” the results of which were supposed to bring the unassimilated foreign body into the “waking consciousness.” I had formulated this to myself less scientifically. I suspected everywhere tendencies and strivings analogous to those of everyday life and conceived the psychic splitting itself as a result of a repelling process, which I then called “defense” and later “regression”. I made a short-lived attempt to reconcile both mechanisms, but as experience showed me always the same and only one thing, my defense theory, I soon became opposed to Breuer’s theory of hypnoid states.

I am, however, quite certain that this difference of opinion had nothing to do with the parting of the ways which occurred soon afterward between us. The latter had a deeper reason, but it happened in such a manner that at first I did not understand it, and only later did I learn to interpret it, following many good indexes. It will be recalled that Breuer had stated, concerning his first famous patient, that the sexual element had been astonishingly undeveloped in her and had never contributed anything to her very marked morbid picture. I have always wondered why the critics of my theory of the sexual etiology of the neuroses have not often opposed it with this assertion of Breuer, and up to this day I do not know whether in this reticence I am to see a proof of their discretion, or of their lack of observation. Whoever will reread the history of Breuer’s patient in the light of the experience gained in the last twenty years, will have no difficulty in understanding the symbolism of the snakes and of the arm. By taking into account also the situation at the sick-bed of the father, he will easily guess the actual meaning of that symptom-formation. His opinion as to the part sexuality played in the psychic life of that girl will then differ greatly from that of her physician. To cure the patient Breuer utilized the most intensive suggestive *rapport* which may serve us as prototype of that which we call “transference.” Now I have strong grounds to suppose that Breuer, after the disposal of the symptoms, must have discovered the sexual motivity of this transference by new signs, but that the general nature of this unexpected phenomenon escaped him, so that here, as though hit by “an untoward event,” he broke off the investigation. I did not obtain from him any direct information of this, but at different

times he has given me sufficient connecting links to justify me in making this combination. And then, as I stood more and more decidedly for the significance of sexuality in the causation of the neuroses, Breuer was the first to show me those reactions of unwilling rejection, with which it was my lot to become so familiar later on, but which I had then not yet recognized as my unavoidable destiny.

The fact that a grossly sexual, tender or inimical, transference occurs in every treatment of a neurosis, although this was neither desired nor induced by either party, has, for me, always seemed to be the most unshakable proof that the forces of the neuroses originate in the sexual life. This argument has surely not been seriously enough considered, for if it were, there would be no question as to where the investigation would tend. For my own conviction, it has remained decisive over and above the special results of the work of the analysis.

Some comfort for the bad reception which my theory of the sexual etiology of the neuroses met with, even in the closer circle of my friends — a negative space was soon formed about my person — I found in the thought that I had taken up the fight for a new and original idea. One day, however, my memories grouped themselves in such a way that this satisfaction was disturbed, but in return I obtained an excellent insight into the origin of our activities and into the nature of our knowledge. The idea for which I was held responsible had not at all originated with me. It had come to me from three persons, whose opinions could count upon my deepest respect; from Breuer himself, from Charcot, and from Chrobak, the gynecologist of our university, probably the most prominent of our Vienna physicians. All three men had imparted to me an insight which, strictly speaking, they had not themselves possessed. Two of them denied their communication to me when later I reminded them of this: the third (Master Charcot) might also have done so, had it been granted me to see him again. But these identical communications, received without my grasping them, had lain dormant within me, until one day they awoke as an apparently original discovery.

One day, while I was a young hospital doctor, I was accompanying Breuer on a walk through the town when a man came up to him urgently desiring to speak with him. I fell back and, when Breuer was free again, he told me, in his kindly, teacher-like manner, that this was the husband of a patient, who had brought him some news about her. The wife, he added,

behaved in so conspicuous a manner when in company, that she had been turned over to him for treatment as a nervous case. He ended with the remark— “those are always secrets of the alcove.” Astonished, I asked his meaning and he explained the expression to me (“secrets of the conjugal bed”), without realizing how preposterous the matter appeared to me.

A few years later, at one of Charcot’s evening receptions, I found myself near the venerated teacher who was just relating to Brouardel a very interesting history from the day’s practice. I did not hear the beginning clearly but gradually the story obtained my attention. It was the case of a young married couple from the far East. The wife was a great sufferer and the husband was impotent, or exceedingly awkward. I heard Charcot repeat: “Tâchez done, je vous assure vous y arriverez.” Brouardel, who spoke less distinctly, must have expressed his astonishment that symptoms as those of the young wife should have appeared as a result of such circumstances, for Charcot said suddenly and with great vivacity: “Mais, dans des cas pareils c’est toujours la chose génital, toujours — toujours — toujours.” And while saying that he crossed his hands in his lap and jumped up and down several times, with the vivacity peculiar to him. I know that for a moment I was almost paralyzed with astonishment, and I said to myself: “Yes, but if he knows this why does he never say so?” But the impression was soon forgotten; brain-anatomy and the experimental production of hysterical paralysis absorbed all my interests.

A year later when I had begun my medical activities in Vienna as a private *dozent* in nervous diseases I was as innocent and ignorant in all that concerned the etiology of the neuroses as any promising academician could be expected to be. One day I received a friendly call from Chrobak, who asked me to take a patient to whom he could not give sufficient time in his new capacity as lecturer at the university. I reached the patient before he did and learned that she suffered from senseless attacks of anxiety, which could only be alleviated by the most exact information as to the whereabouts of her physician at any time in the day. When Chrobak appeared, he took me aside and disclosed to me that the patient’s anxiety was due to the fact that though she had been married eighteen years, she was still a *virgo intacta,* that her husband was utterly impotent. In such cases the physician can only cover the domestic mishap with his reputation and must bear it if people shrug their shoulders and say of him: “He is not a good doctor if in all these years, he has not been able to cure

her.” He added: “The only prescription for such troubles is the one well-known to us, but which we cannot prescribe. It is:

Penis normalis
dosim
Repetatur!

I had never heard of such a prescription and would like to have shaken my head at my informant’s cynicism.

I certainly have not uncovered the illustrious origins of this vicious idea because I would like to shove the responsibility for it on others. I know well that it is one thing to express an idea once or several times in the form of a rapid *aperçu*, and quite another to take it seriously and literally to lead it through all opposing details and conquer for it a place among accepted truths. It is the difference between a light flirtation and a righteous marriage with all its duties and difficulties. Epouser les ideés de — (to marry so and so’s ideas,) is, at least in French, a quite usual form of speech.

Other doctrines which were contributed to the cathartic method through my efforts thus transforming it into psychoanalysis, are the following: The theories of repression and resistance, the addition of the infantile sexuality, and the usage and interpretation of dreams for the understanding of the unconscious.

Concerning the theory of repression, I was certain that I worked independently. I knew of no influence that directed me in any way to it, and I long considered this idea to be original, till O. Rank showed us the place in Schopenhauer’s “The World as Will and Idea,” where the philosopher is struggling for an explanation for sanity. What is there said concerning the striving against the acceptance of a painful piece of reality agrees so completely with the content of my theory of repression that, once again, I must be indebted to my not being well-read for the possibility of making a discovery. To be sure, others have read this passage and overlooked it, without making this discovery and perhaps the same would have happened to me, if, in former years, I had taken more pleasure in reading philosophical authors. In later years I denied myself the great pleasure of Nietzsche’s works, with the conscious motive of not wishing to be hindered in the working out of my psychoanalytic impressions by any

preconceived ideas. Therefore, I had to be prepared — and am so gladly — to renounce all claim to priority in those many cases in which the laborious psychoanalytic investigation can only confirm the insights intuitively won by the philosophers.

The theory of repression is the main pillar upon which rests the edifice of psychoanalysis. It is really the most essential part of it, and is itself nothing other than the theoretical expression of an experience which can be repeated at pleasure whenever one analyzes a neurotic patient without the aid of hypnosis. One is then confronted with a resistance which opposes the analytic work by causing a failure of memory in order to block it. This resistance had to be covered by the use of hypnosis; hence the history of psychoanalysis proper only starts technically with the rejection of hypnosis. The theoretical value of the fact that this resistance is connected with an amnesia leads unavoidably to that conception of the unconscious psychic activities which is peculiar to psychoanalysis, and distinguishes it markedly from the philosophical speculations about the unconscious. It may, therefore, be said that the psychoanalytic theory endeavors to explain two experiences, which result in a striking and unexpected manner during the attempt to trace back the morbid symptoms of a neurotic to their source in his life-history; viz., the facts of transference and of resistance. Every investigation which recognizes these two facts and makes them the starting points of its work may call itself psychoanalysis, even if it lead to other results than my own. But whoever takes up other sides of the problem and deviates from these two assumptions will hardly escape the charge of interfering with the rights of ownership through attempted imitation, if he insist upon calling himself a psychoanalyst.

I would very energetically oppose any attempt to count the principles of repression and resistance as mere assumptions instead of results of psychoanalysis. Such assumptions of a general psychological and biological nature exist, and it would be quite to the point to deal with them in another place. The principle of repression, however, is an acquisition of the psychoanalytic work, won by legitimate means, as a theoretical extract from very numerous experiences. Just such an acquisition, but of much later days, is the theory of the infantile sexuality, of which no count was taken during the first years of tentative analytic investigation. At first it was only noticed that the effect of actual impressions had to be traced back

to the past. However, “the seeker often found more than he bargained for.” He was tempted always further back into this past and finally hoped to be permitted to tarry in the period of puberty, the epoch of the traditional awakening of the sexual impulses. His hopes were in vain. The tracks led still further back into childhood and into its earliest years. In the process of this work it became almost fatal for this young science. Under the influence of the traumatic theory of hysteria, following Charcot, one was easily inclined to regard as real and as of etiological importance the accounts of patients who traced back their symptoms to passive sexual occurrences in the first years of childhood, that is to say, speaking plainly, to seductions. When this etiology broke down through its own unlikelihood, and through the contradiction of well-established circumstances, there followed a period of absolute helplessness. The analysis had led by the correct path to such infantile sexual traumas, and yet these were not true. Thus the basis of reality had been lost. At that time I would gladly have let the whole thing slide, as did my respected forerunner Breuer, when he made his unwished-for discovery. Perhaps I persevered only because I had no longer any choice of beginning something else. Finally I reflected that, after all, no one has a right to despair if he has been disappointed only in his expectations. He merely needs to review them. If hysterics refer their symptoms to imaginary traumas, then this new fact signifies that they create such scenes in their phantasies, and hence psychic reality deserves to be given a place next to actual reality. This was soon followed by the conviction that these phantasies serve to hide the autoerotic activities of the early years of childhood, to idealize them and place them on a higher level, and now the whole sexual life of the child made its appearance behind these phantasies.

In this sexual activity of the first years of childhood, the concomitant constitution could finally attain its rights. Disposition and experience here became associated into an inseparable etiological unity, in that the disposition raised certain impressions to inciting and fixed traumas, which otherwise would have remained altogether banal and ineffectual, whilst the experiences evoked factors from the disposition which, without them, would have continued to remain dormant, and, perhaps, undeveloped. The last word in the question of traumatic etiology was later on said by Abraham, when he drew attention to the fact that just the peculiar nature

of the child's sexual constitution enables it to provoke sexual experiences of a peculiar kind, that is to say, traumas.

My formulations concerning the sexuality of the child were founded at first almost exclusively on the results of the analyses of adults, which led back into the past. I was lacking in opportunity for direct observation of the child. It was, therefore, an extraordinary triumph when, years later, my discoveries were successfully confirmed for the greater part by direct observation and analyses of children of very early years, a triumph that appeared less and less on reflecting that the discovery was of such a nature that one really ought to be ashamed of having made it. The deeper one penetrated into the observation of the child, the more self-evident this fact seemed, and the more strange, too, became the circumstances that such pains had been taken to overlook it.

To be sure, so certain a conviction of the existence and significance of the infantile sexuality can be obtained only, if one follows the path of analysis, if one goes back from the symptoms and peculiarities of neurotics to their uttermost sources, the discovery of which explains what is explainable in them, and permits of modifying what can be changed. I understand that one can arrive at different conclusions if, as was recently done by C. G. Jung, one first forms for one's self a theoretical conception of the nature of the sexual impulse and thereby tries to understand the life of the child. Such a conception can only be chosen arbitrarily or with regard to secondary considerations, and is in danger of becoming inadequate to the sphere in which it was to be utilized. Doubtless, the analytic way also leads to certain final difficulties and obscurities in regard to sexuality and its relation to the whole life of the individual; but these cannot be set aside by speculations, and must wait till solutions will be found by means of other observations or of observations in other spheres.

I shall briefly discuss the history of dream-interpretation. This came to me as the first-fruits of the technical innovation, after, following a dim presentiment, I had decided to replace hypnosis with free associations. It was not the understanding of dreams towards which my curiosity was originally directed. I do not know of any influences which had guided my interest to this or inspired me with any helpful expectations. Before the cessation of my intercourse with Breuer I hardly had time to tell him, in so many words, that I now knew how to translate dreams. During the

development of these discoveries the symbolism of the language of dreams was about the last thing which became known to me, since, for the understanding of symbols, the associations of the dreamer offer but little help. As I have held fast to the habit of first studying things themselves, before looking them up in books, I was able to ascertain for myself the symbolism of dreams before I was directed to it by the work of Sherner. Only later I came to value fully this means of expression of dreams. This was partly due to the influence of the works of Steckel, who was at first very meritorious but who later became most perfunctory. The close connection between the analytic interpretation of dreams and the once so highly esteemed art of dream interpretation of the ancients only became clear to me many years afterwards. The most characteristic and significant portion of my dream theory, namely, the reduction of the dream distortion to an inner conflict, to a sort of inner dishonesty, I found later in an author to whom medicine but not philosophy is unknown. I refer to the engineer J. Popper, who had published “Phantasies of a Realist” under the name of Lyonkeus.

The interpretation of dreams became for me a solace and support in those difficult first years of analysis, when I had to master at the same time the technique, the clinic and the therapy of the neuroses, when I stood entirely alone, and in the confusion of problems and the accumulation of difficulties I often feared to lose my orientation and my confidence. It often took a long time before the proof of my assumption, that a neurosis must become comprehensible through analysis, was seen by the perplexed patient, but the dreams, which might be regarded as analogous to the symptoms, almost regularly confirmed this assumption.

Only because of these successes was I in condition to persevere. I have, therefore, acquired the habit of measuring the grasp of a psychological worker by his attitude to the problem of dream interpretation, and I have noticed, with satisfaction, that most of the opponents of psychoanalysis avoided this field altogether, or if they ventured into it, they behaved most awkwardly. The analysis of myself, the need of which soon became apparent to me, I carried out by the aid of a series of my own dreams which led me through all the happenings of my childhood years. Even today I am of the opinion that in the case of a prolific dreamer and a person not too abnormal, this sort of analysis may be sufficient.

By unfurling this developmental history, I believe I have shown what psychoanalysis is, better than I could have done by a systematic presentation of the subject. The special nature of my findings I did not then recognize. I sacrificed, unhesitatingly, my budding popularity as a physician and an extensive practice among nervous patients, because I searched directly for the sexual origin of their neuroses. In this way I gained a number of experiences which definitely confirmed my conviction of the practical significance of the sexual factor. Without any apprehension, I appeared as speaker at the Vienna Neurological Society, then under the presidency of Krafft-Ebing, expecting to be compensated, by the interest and recognition of my colleagues, for my own voluntary sacrifices. I treated my discoveries as indifferent contributions to science and hoped that others would treat them in the same way. Only the silence that followed my lectures, the space that formed about my person, and the insinuations directed towards me caused me to realize, gradually, that statements about the part played by sexuality in the etiology of the neuroses cannot hope to be treated like other communications. I realized that from then on I would belong to those who, according to Hebbel's expression, "have disturbed the world's sleep," and that I could not count upon being treated objectively and with toleration. But as my conviction of the average correctness of my observations and the conclusions grew greater and greater, and as my faith in my own judgment was not small, any more than was my moral courage, there could be no doubt as to the issue of this situation. I decided to believe that it fell to my lot to discover particularly significant associations, and felt prepared to bear the fate which sometimes accompanies such discoveries.

This fate I pictured to myself in the following manner. I would probably succeed in sustaining myself through the therapeutic successes of the new treatment, but science would take no notice of me in my lifetime. Some decades later, another would surely stumble upon the same, now untimely things, compel their recognition and thus bring me to honor as a necessarily unfortunate forerunner. Meantime I arrayed myself as comfortably as possible à la Robinson Crusoe upon my lonely island. When I look back to those lonely years, from the perplexities and vexatiousness of the present, it seems to me it was a beautiful and heroic time. The "splendid isolation" did not lack its privileges and charms. I did not need to read any literature nor to listen to badly informed opponents. I

was subject to no influences, and no pressure was brought to bear on me. I learned to restrain speculative tendencies and, following the unforgotten advice of my master, Charcot, I looked at the same things again and often until they began of themselves to tell me something. My publications, for which I found shelter despite some difficulty, could safely remain far behind my state of knowledge. They could be delayed as long as I pleased, as there was no doubtful "priority" to be defended. "The Interpretation of Dreams," for example, was completed in all essentials in the beginning of 1896, but was written down only in 1899. The treatment of "Dora" was finished at the end of 1899. The history of her illness was completed in the next two weeks, but was only published in 1905. Meantime my writings were not in the reviewed professional literature of the day. If an exception was made they were always treated with scornful or pitying condescension. Sometimes a colleague would refer to me in one of his publications in very short and unflattering terms, such as "unbalanced," "extreme," or "very odd." It happened once that an assistant at the clinic in Vienna asked me for permission to attend one of my lecture courses. He listened devoutly and said nothing, but after the last lecture he offered to accompany me. During this walk he disclosed to me that, with the knowledge of his chief, he had written a book against my teachings, but he expressed much regret that he had only come to know these teachings better through my lectures. Had he known these before, he would have written very differently. Indeed, he had inquired at the clinic if he had not better first read "The Interpretation of Dreams," but had been advised against doing so, as it was not worth the trouble. As he now understood it, he compared my system of instruction with the Catholic Church. In the interests of his souls salvation I will assume that this remark contained a bit of sincere recognition. But he ended by saying that it was too late to alter anything in his book as it was already printed. This particular colleague did not consider it necessary later on to tell the world something of the change in his opinions concerning my psychoanalysis. On the contrary, as permanent reviewer of a medical journal, he showed a preference to follow its development with his hardly serious comments.

Whatever I possessed of personal sensitiveness was blunted in those years, to my advantage. But I was saved from becoming embittered by a circumstance that does not come to the assistance of all lonely discoverers. Such a one usually frets himself to find out the cause of the

lack of sympathy or of the rejection he receives from his contemporaries, and perceives them as a painful contradiction against the certainty of his own conviction. That did not trouble me, for the psychoanalytic fundamental principles enabled me to understand this attitude of my environment as a necessary sequence. If it was true that the associations discovered by me were kept from the knowledge of the patient by inner affective resistances, then this resistance must manifest itself also in normal persons as soon as the repressed material is conveyed to them from the outside. It was not strange that these latter knew how to give intellectual reasons for their affective rejections of my ideas. This happened just as often with the patients, and the arguments advanced — arguments are as common as blackberries, to borrow from Falstaff's speech — were the same and not exactly brilliant. The only difference was that in the case of patients one had the means of bringing pressure to bear, in order to help them recognize and overcome their resistances, but in the case of those seemingly normal, such help had to be omitted. To force these normal people to a cool and scientifically objective examination of the subject was an unsolved problem, the solution of which was best left to time. In the history of science it has often been possible to verify that the very assertion which, at first, called forth only opposition, received recognition a little later without the necessity of bringing forward any new proofs.

That I have not developed any particular respect for the opinion of the world or any desire for intellectual deference during those years, when I alone represented psychoanalysis, will surprise no one.

II

Beginning with the year 1902 a number of young doctors crowded about me with the expressed intention to learn psychoanalysis, to practice it and to spread it. The impetus for this came from a colleague who had himself experienced the beneficial effects of the analytic therapy. We met on certain evenings at my residence, and discussed subjects according to certain rules. The visitors endeavored to orient themselves in this strange and new realm of investigation, and to interest others in the matter. One day a young graduate of the technical school found admission to our circle by means of a manuscript which showed extraordinary sense. We induced him to go through college and enter the university, and then devote himself to the non-medical application of psychoanalysis. Thus the little society gained a zealous and reliable secretary, and I acquired in Otto Rank a most faithful helper and collaborator.

Soon the little circle expanded, and in the course of the next few years changed a good deal in its composition. On the whole, I could flatter myself that in the wealth and variety of talent our circle was hardly inferior to the staff of any clinical teacher. From the very beginning it included those men who later were to play a considerable, if not always a delectable, part in the history of the psychoanalytic movement. But these developments could not have been guessed at that time. I was satisfied, and I believe I did all I could, to convey to the others what I knew and had experienced. There were only two inauspicious circumstances which at least mentally estranged me from this circle. I could not succeed in establishing among the members that friendly relation which should obtain among men doing the same difficult work, nor could I crush out the quarrels about the priority of discoveries, for which there were ample opportunities in those conditions of working together. The difficulties of teaching the practise of psychoanalysis, which are particularly great, and are often to blame for the present rejection of psychoanalysis, already made themselves felt in this Viennese private psychoanalytic society. I myself did not dare to present an as yet incomplete technique, and a theory still in the making, with that authority which might have spared the others many a blind alley and many a final tripping up. The self-dependence of mental workers, their early independence of the teacher, is always

gratifying psychologically, but it can only result in a scientific gain when during these labors certain, not too frequently occurring, personal relations are also fulfilled. Psychoanalysis particularly should have required a long and severe discipline and training of self-control. On account of the courage displayed in devotion to so ridiculed and fruitless a subject, I was inclined to tolerate among the members much to which otherwise I would have objected. Besides, the circle included not only physicians, but other cultured men who had recognized something significant in psychoanalysis. There were authors, artists, and so forth. The “Interpretation of Dreams,” the book on “Wit,” and other writings, had already shown that the principles of psychoanalysis cannot remain limited to the medical field, but are capable of application to various other mental sciences.

In 1907 the situation suddenly altered and quite contrary to all expectations; it became evident that psychoanalysis had unobtrusively awakened some interest and gained some friends, that there were even some scientific workers who were prepared to admit their allegiance. A communication from Bleuler had already acquainted me with the fact that my works were studied and applied in Burghölzli. In January, 1907, the first man attached to the Zürich Clinic, Dr. Eitingon, visited me at Vienna. Other visitors soon followed, thus causing a lively exchange of ideas. Finally, by invitation of C. G. Jung, then still an assistant physician at Burghölzli, the first meeting took place at Salzburg, in the spring of 1908, where the friends of psychoanalysis from Vienna, Zürich, and other places met together. The result of this first psychoanalytic congress, was the founding of a periodical, which began to appear in 1909, under the name of “Jahrbuch für Psychoanalytische und Psychopathologische Forschungen,” published by Bleuler and Freud, and edited by Jung. An intimate comradeship in the work done at Vienna and Zürich found its expression in this publication.

I have repeatedly and gratefully acknowledged the efforts of the Zürich Psychiatric School in the spreading of psychoanalysis, especially those of Bleuler and Jung, and I do not hesitate to do the same today, even under such changed circumstances. It was certainly not the partisanship of the Zürich School which at that time first directed the attention of the scientific world to the subject of psychoanalysis. This latency period had just come to an end, and psychoanalysis everywhere became the object of constantly increasing interest. But whilst in all the other places this

manifestation of interest resulted first in nothing but a violent and emphatic repudiation of the subject, in Zürich, on the contrary, the main feeling of the situation was that of agreement. In no other place was so compact a little gathering of adherents to be found, nowhere also was it possible to place a public clinic at the service of psychoanalytic investigation, or to find a clinical teacher who regarded the principles of psychoanalysis as an integral part of the teaching of psychiatry. The Zürich doctors became, as it were, the nucleus of the little band which was fighting for the recognition of psychoanalysis. Only in Zürich was there a possible opportunity to learn the new art and to apply it in practice. Most of my present-day followers and co-workers came to me via Zürich, even those who might have found, geographically speaking, a shorter road to Vienna than to Switzerland. Vienna lies in an eccentric position from western Europe, which houses the great centers of our culture. For many years it has been much affected by weighty prejudices. The representatives of the most prominent nations stream into Switzerland, which is so mentally active, and an infective lesion in this place was sure to become very important for the dissemination of the “psychic epidemic,” as Hoche of Freiburg called it.

According to the testimony of a colleague who was an eyewitness of the developments at Burghölzli, it may be asserted that psychoanalysis awakened an interest there very early. Already in Jung’s work on occult phenomena, published in 1902, there was an allusion to dream-interpretation. Ever since 1903 or 1904, according to my informer, psychoanalysis came into prominence. After the estabment of personal relations between Vienna and Zürich, a society was also founded in Burghölzli in 1907 which discussed the problems of psychoanalysis at regular meetings. In the bond that united the Vienna and Zürich schools, the Swiss were by no means the merely recipient part. They had themselves already performed respectable scientific work, the results of which were of much use to psychoanalysis. The association-experiment, started by the Wundt School, had been interpreted by them in the psychoanalytic sense and had proved itself of unexpected usefulness. Thus it had become possible to get rapid experimental confirmation of psychoanalytic facts, and to demonstrate experimentally to beginners certain relationships which the analyst could only have talked about

otherwise. The first bridge leading from experimental psychology to psychoanalysis had thus been constructed.

In psychoanalytic treatment, however, the association-experiment enables one to make only a preliminary, qualitative analysis of the case, it offers no essential contribution to the technique, and is really not indispensable in the work of analysis. Of more importance, however, was another discovery of the Zürich School, or rather, of its two leaders, Bleuler and Jung. The former pointed out that a great many purely psychiatric cases can be explained by the same psychoanalytic process as those used in dreams and in the neuroses (Freudsche Mechanismen). Jung employed with success the analytic method of interpretation in the strangest and most obscure phenomena of dementia præcox, the origin of which appeared quite clear when correlated with the life and interests of the patient. From that time on it became impossible for the psychiatrists to ignore psychoanalysis. Bleuler's great work on Schizophrenic (1911), in which the psychoanalytic points of view are placed on an equal footing with the clinical-systematic ones, brought this success to completion.

I must not omit to point out a divergence which was then already distinctly noticeable in the working tendencies of the two schools. Already in 1897 I had published the analysis of a case of schizophrenia, which showed, however, paranoid trends, so that its solution could not have anticipated the impression of Jung's analyses. But to me the important element had not been the interpretation of the symptoms, but rather the psychic mechanisms of the disease, and above all, the agreement of this mechanism with the one already known in hysteria. No light had been thrown at that time on the difference between these two maladies. I was then already working toward a theory of the libido in the neuroses which was to explain all neurotic as well as psychotic appearances on the basis of abnormal drifts of the libido. The Swiss investigators lacked this point of view. So far as I know Bleuler, even today, adheres to an organic causation for the forms of Dementia Præcox, and Jung, whose book on this malady appeared in 1907, upheld the toxic theory of the same at the Congress at Salzburg in 1908, which though not excluding it, goes far beyond the libido theory. On this same point he came to grief later (1912), in that he now used too much of the stuff which previously he refused to employ at all.

A third contribution from the Swiss School, which is to be ascribed probably entirely to Jung, I do not value as highly as do others who are not in as close contact with it. I speak of the theory of the *complexes*, which grew out of the "Diagnostische Assoziationsstudien" (1906-1910). It itself has neither resulted in a psychological theory nor has it added an unconstrained insertion to the context of the psychoanalytic principles. On the other hand, the word "complex" has gained for itself the right of citizenship in psychoanalysis, as being a convenient and often an indispensable term for descriptive summaries of psychologic facts. None other among the names and designations, newly coined as a result of psychoanalytic needs, has attained such widespread popularity; but no other term has been so misapplied to the detriment of clear thinking. In psychoanalytic diction one often spoke of the "return of the complex" when "the return of the repression" was intended to be conveyed, or one became accustomed to say "I have a complex against him," when more correctly he should have said "a resistance."

In the years after 1907, which followed the union of the schools of Vienna and Zürich, psychoanalysis received that extraordinary impetus in which it still finds itself today. This is positively attested by the spread of psychoanalytic literature and the increase in the number of doctors who desire to practice or learn it, also by the mass of attacks upon it by congresses and learned societies. It has wandered into the most distant countries, it everywhere shocked psychiatrists, and has gained the attention of the cultured laity and workers in other scientific fields. Havelock Ellis, who has followed its development with sympathy without ever calling himself its adherent, wrote, in 1911, in a paper for the Australasian Medical Congress: "Freud's psychoanalysis is now championed and carried out not only in Austria and in Switzerland, but in the United States, in England, India, Canada, and, I doubt not, in Australasia." A doctor from Chile (probably a German) appeared at the International Congress in Buenos Aires, in 1910, and spoke on behalf of the existence of infantile sexuality and praised the results of psychoanalytic therapy in obsessions. An English neurologist in Central India informed me through a distinguished colleague who came to Europe, that the cases of Mohammedan Indians on whom he had practiced analysis showed no other etiology of their neuroses than our European patients.

The introduction of psychoanalysis into North America took place under particularly glorious auspices. In the autumn of 1909, Jung and myself were invited by President Stanley Hall, of Clark University, to take part in the celebration of the twentieth anniversary of the opening of Clark University, by giving some lectures in German. We found, to our great astonishment, that the unprejudiced men of that small but respected pedagogic-philosophical university knew all the psychoanalytic writings and had honored them in their lectures to their students. Thus even in prudish America one could, at least in academic circles, discuss freely and treat scientifically all those things that are regarded as offensive in life. The five lectures that I improvised at Worcester then appeared in English in the American Journal of Psychology; later on they were printed in German under the title, “Über Psychoanalyse.” Jung lectured on diagnostic association studies and on “conflicts in the psychic life of the child.” We were rewarded for it with the honorary degree of LL.D. During this week of celebration at Worcester, psychoanalysis was represented by five persons. Besides Jung and myself there were Ferenczi, who had joined me as travelling-companion, Ernest Jones, then of Toronto University (Canada), now in London, and A. A. Brill, who was already practising psychoanalysis in New York.

The most noteworthy personal relationship which resulted at Worcester, was that established with James J. Putnam, teacher of neuropathology at Harvard University. For years he had expressed a disparaging opinion of psychoanalysis, but now he befriended it and recommended it to his countrymen and his colleagues in numerous lectures, rich in content and fine of form. The respect which he enjoys in his America, owing to his character, his high moral standard and his keen love for truth, was very helpful to the cause of psychoanalysis and protected it against the denunciations to which it might otherwise have early succumbed. Yielding too much to the great ethical and philosophic bent of his nature Putnam later required of psychoanalysis what, to me, seems an impossible demand. He wished that it should be pressed into the service of a certain moral philosophical conception of the universe; but Putnam has remained the chief prop of the psychoanalytic movement in his native land.

For the diffusion of this movement Brill and Jones deserve the greatest credit. With a self-denying industry they constantly brought under the notice of their countrymen, through their works, the easily observable

fundamental principles of psychoanalysis of everyday life, of the dream and of the neuroses. Brill has strengthened these influences by his medical activities and his translations of my writings: Jones, by illuminating lectures and clever discussions at the American Congresses. The lack of a rooted scientific tradition and the lesser rigidity of official authority have been of decided advantage to the impetus given to psychoanalysis in America by Stanley Hall. It was characteristic there from the beginning that professors, heads of insane asylums, as well as independent practitioners, all showed themselves equally interested in psychoanalysis. But just for this very reason it is clear that the fight for psychoanalysis must be fought to a decisive end, where the greater resistance has been met with, namely, in the countries of the old cultural centers.

Of the European countries, France has so far shown herself the least receptive towards psychoanalysis, although creditable writings by the Zürich physician, A. Maeder, have opened up for the French reader an easy path to its principles. The first indications of interest came from provincial France. Moricheau-Beauchant (Poitiers) was the first Frenchman who openly accepted psychoanalysis. Régis and Hesnard (Bordeaux) have lately tried (1913) to overcome the prejudices of their countrymen by an exhaustive and senseful presentation of the subject, which takes exception only to symbolism. In Paris itself there still appears to reign the conviction (given such oratorical expression at London Congress 1913 by Janet) that every thing good in psychoanalysis only repeats, with slight modifications, the views of Janet — everything else in psychoanalysis being bad. Janet himself had to stand at this Congress a number of corrections from Ernest Jones, who was able to reproach him for his lack of knowledge of the subject. We cannot, however, forget the credit due Janet for his works on the psychology of the neuroses, although we must repudiate his claims. Italy, after many promising starts, ceased to take further interest. Owing to personal connections psychoanalysis gained an early hearing in Holland: Van Emden, Van Ophuijsen, Van Renterghem (“Freud en zijn school”) and the two doctors Stärke are busy in Holland particularly on the theoretical side. The interest in psychoanalysis in scientific circles in England developed very slowly, but the indications are that just here, favored by the English liking for the practical and their passionate championship of justice, a flourishing future awaits psychoanalysis.
